Intel®C++ Compiler Classic Developer Guide and Reference

This guide contains information for version 2021.7 of the compiler.

Intel® C++ Compiler Classic (icc) is deprecated and will be removed in a oneAPI release in the second half of 2023. Intel recommends that customers transition now to using the LLVM-based Intel® oneAPI DPC++/C++ Compiler (icx) for continued Windows* and Linux* support, new language support, new language features, and optimizations. Note that starting with release 2021.7, macOS* support is limited to Mac* computers with Intel® Processors.

This document contains information about the Intel® C++ Compiler Classic (`icc` for Linux* and `icl` for Windows*) compiler and runtime environment. The Intel® C++ Compiler Classic can be found in the Intel® oneAPI HPC Toolkit, Intel® oneAPI IoT Toolkit, or as a standalone compiler. More information and specifications about Intel C/C++ compilers can be found on the Intel® oneAPI DPC++/C++ Compiler product page and in the Release Notes.

The following are some important sections of the compiler developer guide:

Compiler Setup	Compiler Setup explains how to invoke the compiler on the command line or from within an IDE.
OpenMP* Support	The compiler supports many OpenMP* features, including most of OpenMP* Version TR4: Version 5.0.
Compiler Options	Compiler Options provides information about options you can use to affect optimization, code generation, and more.
Intrinsics	Intrinsics let you generate more readable code, simplify instruction scheduling, reduce debugging, access the instructions that cannot be generated using the standard constructs of the C and C++ languages, and more.
Pragmas	Pragmas provide the compiler with the instructions for specific tasks, such as splitting large loops into smaller ones, enabling or disabling optimization for code, or offloading computation to the target.
Context Sensitive/F1 Help	To use the Context Sensitive/F1 Help feature, visit the Download Documentation: Intel® Compiler (Current and Previous) page and follow the instructions provided there.
Download Previous Versions of the Developer Guide and Reference	Visit the Download Documentation: Intel® Compiler (Current and Previous) page to download PDF or FAR HTML versions of previous compiler documentation.

NOTE For the best search experience, use a Google Chrome* or Internet Explorer* browser to view your downloaded copy of the Developer Guide and Reference.
If you use Mozilla Firefox*, you may encounter an issue where the **Search** tab does not work. As a workaround, you can use the **Contents** and **Index** tabs or a third-party search tool to find your content.

Part I

Introducing the Intel® C++ Compiler Classic

Using the Intel® C++ Compiler Classic, you can compile and generate applications that can run on Intel® 64 architecture. You can also create programs for the IA-32 architecture on Windows* and Linux*.

Intel® 64 architecture applications can run on the following:

- Windows operating systems for Intel® 64 architecture-based systems.
- Linux operating systems for Intel® 64 architecture-based systems.
- macOS operating systems for Intel® 64 architecture-based systems.

IA-32 architecture applications can run on the following:

- Supported Windows operating systems
- Supported Linux operating systems

Unless specified otherwise, assume the information in this document applies to all supported architectures and all operating systems.

You can use the compiler in the command-line or in a supported Integrated Development Environment (IDE):

- Microsoft Visual Studio* (Windows only)
- Eclipse*/CDT (Linux only)
- Xcode* (macOS only)

See the Release Notes for complete information on supported architectures, operating systems, and IDEs for this release.

Product and Performance Information
Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex. Notice revision #20201201

Feature Requirements

To use these tools and features, you need licensed versions of the tools and you must have an appropriately supported version of the product edition. For more information, check the product release notes.

NOTE Some features may require additional product installation.

The following table shows components (tools) and where to find additional information on them.

Component	More Information
Intel® C++ Compiler Classic Intel® Advisor Intel® Inspector Intel® Trace Analyzer and Collector	More information on tools and features can be found on the Intel® Developer Zone and the Software Development Tools pages.

Component	More Information
Intel® VTune™ Profiler	

The following table lists dependent features and their corresponding required products. For certain compiler options, the compilation may fail if the option is specified but the required product is not installed. In this case, remove the option from the command line and recompile.

Feature Requirements

Feature	Requirement
Intel® oneAPI Threading Building Blocks (oneTBB)	The `-tbb`, `-qtbb`, and `/Qtbb` options require a oneTBB install.
Intel® oneAPI Math Kernel Library (oneMKL)	The `-qmkl`, `-mkl`, and `/Qmkl` options require a oneMKL install.
Intel® oneAPI Data Analytics Library (oneDAL)	The `-daal`, `-qdaal`, and `/Qdaal` options require a oneDAL install.
Intel® Integrated Performance Primitives (Intel® IPP)	The `-ipp`, `-qipp`, and `/Qipp` options require an Intel® IPP install.
Intel® Integrated Performance Primitives Cryptography (Intel® IPP Cryptography)	Use `crypto` to link to the Intel® IPP Cryptography library.
Thread Checking	Intel® Inspector
Trace Analyzing and Collecting	Intel® Trace Analyzer and Collector Compiler options related to this feature may require a set-up script. For further information, see the product documentation.

Refer to the Release Notes for detailed information about system requirements, late changes to the products, supported architectures, operating systems, and Integrated Development Environments (IDEs).

Get Help and Support

Windows*

Documentation is available from within the version of Microsoft Visual Studio*. You must install the documentation on your local system. To use the feature, visit the Download Documentation: Intel® Compiler (Current and Previous) page and follow the instructions provided there. From the **Help** menu, choose **Intel Compilers and Libraries** to view the installed user and reference documentation.

Linux* and macOS

On Linux and macOS, the documentation has limited integration in the Eclipse*/CDT and Xcode*. In both cases, the integrated documentation only provides details about where to find the product documentation on your local system.

Intel® Software Documentation

You can find product documentation for many released products at: https://software.intel.com/content/www/us/en/develop/documentation.html

Product Website and Support

To find product information, register your product, or contact Intel, visit: https://software.intel.com/content/www/us/en/develop/support.html

At this site, you will find comprehensive product information, including:

- Links to Get Started, Documentation, Individual Support, and Registration
- Links to information such as white papers, articles, and user forums
- Links to product information
- Links to news and events

Online Service Center

Each purchase of an Intel® Software Development Product includes a year of support services, which includes priority customer support at our Online Service Center. For more information about the Online Service Center visit: https://supporttickets.intel.com/servicecenter

> **NOTE** To access support, you must register your product at the Intel® Registration Center: https://registrationcenter.intel.com/en/products/

Release Notes

For detailed information on system requirements, late changes to the products, supported architectures, operating systems, and Integrated Development Environments (IDE) see the Release Notes for the product.

Forums

You can find helpful information in the Intel Software user forums. You can also submit questions to the forums. To see the list of the available forums, go to https://community.intel.com/t5/Software-Development-Tools/ct-p/software-dev-tools

Related Information

Recommended Additional Reading

You are strongly encouraged to read the following books for in-depth understanding of threading. Each book discusses general concepts of parallel programming by explaining a particular programming technology:

- For information on Intel® Threading Building Blocks (Intel® TBB): Reinders, James. *Intel Threading Building Blocks: Outfitting C++ for Multi-core Processor Parallelism*. O'Reilly, July 2007
- For information on OpenMP* technology: Chapman, Barbara, Gabriele Jost, Ruud van der Pas, and David J. Kuck (foreword). *Using OpenMP: Portable Shared Memory Parallel Programming*. MIT Press, October 2007
- For information on Microsoft Win32* Threading (for Windows* users): Akhter, Shameem, and Jason Roberts. *Multi-Core Programming: Increasing Performance through Software Multithreading*, Intel Press, April 2006

Intel does not endorse these books or recommend them over other books on the same subjects.

Additional Product Information

For additional technical product information including white papers, forums, and documentation, visit https://software.intel.com/content/www/us/en/develop/tools.html

Additional Language Information

- For information about the C++ standards, visit the C++ website: http://www.isocpp.org/
- For information about the C standards, visit the C website: http://www.open-std.org/jtc1/sc22/wg14/
- For information about the OpenMP* standards, visit the OpenMP website: http://www.openmp.org/

Notational Conventions

Information in this documentation applies to all supported operating systems and architectures unless otherwise specified. This documentation uses the following conventions:

Notational Conventions

THIS TYPE	Indicates language keywords.
this type	Indicates command-line or option arguments.
`This type`	Indicates a code example.
`This type`	Indicates what you type as input.
This type	Indicates menu names, menu items, button names, dialog window names, and other user-interface items.
File > Open	Menu names and menu items joined by a greater than (>) sign to indicate a sequence of actions. For example, **Click File > Open** indicates that in the **File** menu, you would click **Open** to perform this action.
{value | value}	Indicates a choice of items or values. You can usually only choose one of the values in the braces.
[*item*]	Indicates items that are optional.
item [, *item*]...	Indicates that the item preceding the ellipsis (...) can be repeated.
Intel® C++	This term refers to the name of the common compiler language supported by the Intel® C++ Compiler Classic.
compiler or the compiler	These terms are used when information is not limited to only one specific compiler, or when it is not necessary to indicate a specific compiler.
Windows or Windows operating system	These terms refer to all supported Microsoft Windows operating systems.
Linux or Linux operating system	These terms refer to all supported Linux operating systems.
macOS or macOS operating system	These terms refer to all supported macOS operating systems.

*	An asterisk at the end of a word or name indicates it is a third-party product trademark.
compiler option	This term refers to Linux, macOS, or Windows options, which are used by the compiler to compile applications.

Additional Conventions Used for Compiler Options

compiler option name shortcuts	The following conventions are used as shortcuts when referencing compiler option names in descriptions: • No initial – or / This shortcut is used for option names that are the same for Linux and Windows except for the initial character. For example, `Fa` denotes: • Linux and macOS: `-Fa` • Windows: `/Fa` • [Q]option-name This shortcut is used for option names that only differ because the Windows form starts with a Q. For example, [Q]ipo denotes: • Linux and macOS: `-ipo` • Windows: `/Qipo` • [q or Q]option-name This shortcut is used for option names that only differ because the Linux form starts with a q and the Windows form starts with a Q. For example, [q or Q]opt-report denotes: • Linux and macOS: `-qopt-report` • Windows: `/Qopt-report` More dissimilar compiler option names are shown in full.
`/option` or `-option`	A slash before an option name indicates the option is available on Windows. A dash before an option name indicates the option is available on Linux and macOS systems. For example: • Linux and macOS: `-help` • Windows: `/help`

	NOTE If an option is available on all supported operating systems, no slash or dash appears in the general description of the option. The slash and dash will only appear where the option syntax is described.
`/option:argument` or `-option=argument`	Indicates that an option requires an argument (parameter). For example, you must specify an argument for the following options: • Linux and macOS: `-mtune=`*processor* • Windows: `/tune:`*processor*
`/option:`*`keyword`* or `-option=`*`keyword`*	Indicates that an option requires one of the *`keyword`* values.
`/option`[:*`keyword`*] or `-option`[=*`keyword`*]	Indicates that the option can be used alone or with an optional keyword.
`option`[*n*] or `option`[:*n*] or `option`[=*n*]	Indicates that the option can be used alone or with an optional value. For example, in `-unroll`[=*n*], the *n* can be omitted or a valid value can be specified for *n*.
`option`[-]	Indicates that a trailing hyphen disables the option. For example, `/Qglobal_hoist-` disables the Windows option `/Qglobal_hoist`.
`[no]option` or `[no-]option`	Indicates that `no` or `no-` preceding an option disables the option. For example: In the Linux and macOS option `-[no-]global_hoist`, `-global_hoist` enables the option, while `-no-global_hoist` disables it. In the Windows option `/[no]traceback`, `/traceback` enables the option, while `/notraceback` disables it. In some options, the `no` appears later in the option name. For example, `-fno-common` disables the `-fcommon` option.

Part II

Compiler Setup

You can use the Intel® C++ Compiler Classic from the command line, Eclipse, Microsoft Visual Studio, or Xcode.

These IDEs are described in further detail in their corresponding sections.

See Also

Use the Command Line
Use Eclipse
Use Microsoft Visual Studio
Use Xcode

Use the Command Line

This section provides information about the Command Line Interface (CLI).

Specify the Location of Compiler Components

Before you invoke the compiler, you may need to set certain environment variables that define the location of compiler-related components. The compiler includes environment configuration scripts to configure your build and development environment variables:

- On Linux, and macOS, the file is a shell script called `setvars.sh`.
- On Windows, the file is a batch file called `setvars.bat`.

> **NOTE** If you are using older Intel® Parallel Studio XE or Intel® System Studio bits, you need to use `compilervars` instead of `setvars`.

Linux and macOS

Set the environment variables before using the compiler by sourcing the shell script `setvars.sh`. Depending on the shell, you can use the `source` command or a `.` (dot) to source the shell script, according to the following rules for a `.sh` script:

Using source:

```
source /<install-dir>/setvars.sh <arg1> <arg2> … <argn>
```

Example:

```
source /opt/intel/oneapi/setvars.sh intel64
```

Using . (dot):

```
. /<install-dir>/setvars.sh <arg1> <arg2> … <argn>
```

Example:

```
. /opt/intel/oneapi/setvars.sh intel64
```

Use `source /<install-dir>/setvars.sh --help` for more `setvars` usage information.

The compiler environment script file accepts an optional target architecture argument `<arg>`:

- `intel64`: Generate code and use libraries for Intel® 64 architecture-based targets.
- `ia32`: Generate code and use libraries for IA-32 architecture-based targets.

If you want the `setvars.sh` script to run automatically in all of your terminal sessions, add the source `setvars.sh` command to your startup file. For example, inside your `.bash_profile` entry for Intel® 64 architecture targets.

If the proper environment variables are not set, errors similar to the following may appear when attempting to execute a compiled program:

```
./a.out: error while loading shared libraries:
libimf.so: cannot open shared object file: No such file or directory
```

Windows

Under normal circumstances, you do not need to run the `setvars.bat` batch file. The terminal shortcuts in the Windows **Start** menu, **Intel oneAPI command prompt for <target architecture> for Visual Studio <year>**, set these variables automatically.

For additional information, see Use the Command Line on Windows.

You need to run the `setvars` batch file if a command line is opened without using one of the provided **Command Prompt** menu items in the **Start** menu, or if you want to use the compiler from a script of your own.

The `setvars` batch file inserts DLL directories used by the compiler and libraries at the beginning of the existing `Path`. Because these directories appear first, they are searched before any directories that were part of the original `Path` provided by Windows (and other applications). This is especially important if the original `Path` includes directories with files that have the same names as those added by the compiler and libraries.

The `setvars` batch file takes multiple optional arguments; the following two arguments are recognized for compiler and library initialization:

```
<install-dir>\setvars.bat [<arg1>] [<arg2>]
```

Where *<arg1>* is optional and can be one of the following:

- `intel64`: Generate code and use libraries for Intel® 64 architecture (host and target).
- `ia32`: Generate code and use libraries for IA-32 architecture (host and target).

The *<arg2>* is optional. If specified, it is one of the following:

- `vs2022`: Microsoft Visual Studio 2022
- `vs2019`: Microsoft Visual Studio 2019
- `vs2017`: Microsoft Visual Studio 2017.

NOTE Support for Microsoft Visual Studio 2017 is deprecated as of the Intel® oneAPI 2022.1 release and will be removed in a future release.

If *<arg1>* is not specified, the script uses the `intel64` argument by default. If *<arg2>* is not specified, the script uses the highest installed version of Microsoft Visual Studio detected during the installation procedure.

Requirements Before Using the Command Line

You may need to set certain environment variables before using the command line. For more information, see Specify the Location of Compiler Components.

Different Compilers and Drivers

The table below provides the different compiler front-end and driver information.

Compiler	Notes	Linux Driver	Windows Driver
Intel® C++ Compiler Classic	A C++ compiler that supports an OpenMP but not OpenMP offload.	`icc` for C `icpc` for C++	`icl`

Use the Compiler from the Command Line

Use the compiler with the OS/language specific invocations below.

Linux

Invoke the compiler using `icc`/`icpc` to compile C/C++ source files.

- When you invoke the compiler with `icc` the compiler builds C source files using C libraries and C include files. If you use `icc` with a C++ source file, it is compiled as a C++ file. Use `icc` to link C object files.
- When you invoke the compiler with `icpc` the compiler builds C++ source files using C++ libraries and C++ include files. If you use `icpc` with a C source file, it is compiled as a C++ file. Use `icpc` to link C++ object files.

The `icc`/`icpc` command:

- Compiles and links the input source file(s).
- Produces one executable file, `a.out`, in the current directory.

macOS:

Invoke the compiler using `icc` or `icpc` to compile C/C++ source files.

- When you invoke the compiler with `icc`, the compiler builds C source files using C libraries and C include files. If you use `icc` with a C++ source file, it is compiled as a C++ file. Use `icc` to link C object files.
- When you invoke the compiler with `icpc` the compiler builds C++ source files using C++ libraries and C++ include files (libc++ library is used by default). If you use `icpc` with a C source file, it is compiled as a C++ file. Use `icpc` to link C++ object files.

The `icc`/`icpc` command:

- Compiles and links the input source file(s).
- Produces one executable file, `a.out`, in the current directory.

Windows

You can invoke the compiler on the command line using `icl`. This command:

- Compiles and links the input source file(s).
- Produces object file(s) and assigns the names of the respective source file(s), but with a `.obj` extension.
- Produces one executable file and assigns it the name of the first input file on the command line, but with a `.exe` extension.
- Places all the files in the current directory.

When compilation occurs with the compiler, many tools may be called to complete the task that may reproduce diagnostics unique to the given tool. For instance, the linker may return a message if it cannot resolve a global reference.

Command Line Syntax

The syntax to invoke the compiler is:

Linux and macOS

```
icc [option] file1 [file2...]
```

Windows

```
icl [option] file1 [file2...]
```

Argument	Description
`option`	Indicates one or more command line options. On Linux and macOS systems, the compiler recognizes one or more letters preceded by a hyphen (`-`). On Windows, options are preceded by a hyphen (`-`) or slash (`/`). This includes linker options. Options are not required when invoking the compiler. The default behavior of the compiler implies that some options are ON by default when invoking compiler.
`file1, file2...`	Indicates one or more files to be processed by the compiler.
`/link` (Windows)	All options following `/link` are passed to the linker. Compiler options must precede `link` if they are not to be passed to the linker.

Other Methods for Using the Command Line to Invoke the Compiler

- **Using makefiles from the Command Line:** Use makefiles to specify a number of files with various paths and to save this information for multiple compilations. For more information on using makefiles, see Use Makefiles to Compile Your Application.
- **Using a Batch File from the Command Line:** Create and use a `.bat` file to execute the compiler with a desired set of options instead of retyping the command each time you need to recompile.

Use Eclipse
Use Microsoft Visual Studio
Use Xcode
Use Makefiles to Compile Your Application
watch compiler option

Use the Command Line on Windows

The compiler provides a shortcut to access the command line with the appropriate environment variables already set.

To invoke the compiler from the command line:

1. Open the Windows **Start** menu.
2. Scroll down the list of apps (programs) in the **Start** menu and find the **Intel oneAPI 2021** folder.
3. Left click on the folder name and select your component. The command prompts shown are dependent on the versions of Microsoft Visual Studio you have installed on your machine.
4. Right click on the command prompt icon to pin it to your taskbar. This step is optional.
5. The command line opens.

You can use any command recognized by the Windows command prompt, plus some additional commands.

Because the command line runs within the context of Windows, you can easily switch between the command line and other applications for Windows or have multiple instances of the command line open simultaneously.

When you are finished working in a command line, use the **exit** command to close and end the session.

File Extensions

Input File Extensions

The Intel® C++ Compiler Classic recognizes input files with the extensions listed in the following table:

File Name	Interpretation	Action
`file.c`	C source file	Passed to compiler

`file.C`
`file.CC`
`file.cc`
`file.cpp`
`file.cxx`
	C++ source file	Passed to compiler

`file.lib` (Windows) `file.a` `file.so` (Linux and macOS) `file.dylib` (macOS)	Library file	Passed to linker
`file.i`	Preprocessed file	Passed to compiler
`file.obj` (Windows) `file.o` (Linux and macOS)	Object file	Passed to linker
`file.asm` (Windows)	Assembly file	Passed to assembler

File Name	Interpretation	Action
`file.s` (Linux and macOS) `file.S` (Linux and macOS)		

Output File Extensions

The Intel® C++ Compiler Classic produces output files with the extensions listed in the following table:

File Name	Description
`file.i`	Preprocessed file: Produced with the `-E` option.
`file.o` (Linux and macOS) `file.obj` (Windows)	Object file: Produced with the `-c` (Linux, macOS, and Windows) object. The `/Fo` (Windows) or `-o` (Linux) option allows you to rename the output object file.
`file.s` (Linux and macOS) `file.asm` (Windows)	Assembly language file: Produced with the `-S` option. The `/Fa` (Windows) or `-s` (Linux) option allows you to rename the output assembly file.
`a.out` (Linux and macOS) `file.exe` (Windows)	Executable file: Produced by the default compilation. The `/Fe` (Windows) or `-o` (Linux) option allows you to rename the output executable file.

See Also

Invoke the Compiler
Specify Compiler Files

Use Makefiles for Compilation

This topic describes the use of makefiles to compile your application. You can use makefiles to specify a number of files with various paths, and to save this information for multiple compilations.

Use Makefiles to Store Information for Compilation on Linux or macOS

To run `make` from the command line using the compiler, make sure that `/usr/bin` and `/usr/local/bin` are in your *PATH* environment variable.

If you use the C shell, you can edit your `.cshrc` file and add the following:

```
setenv PATH /usr/bin:/usr/local/bin:$PATH
```

To use the compiler, your makefile must include the setting `CC=icc`. Use the same setting on the command line to instruct the makefile to use the compiler. If your makefile is written for GCC, you need to change the command line options that are not recognized by the compiler. Run `make`, using the following syntax:

```
make -f yourmakefile
```

Where `-f` is the `make` command option to specify a particular makefile name.

Use Makefiles to Store Information for Compilation on Windows

To use a makefile to compile your source files, use the `nmake` command with the following syntax:

```
nmake /f [makefile_name.mak] CPP=[compiler_name] [LINK32=[linker_name]
```

Example:

```
nmake /f your_project.mak CPP=icl LINK32=link
```

Argument	Description
`/f`	The `nmake` option to specify a makefile.
`your_project.mak`	The makefile used to generate object and executable files.
`CPP`	The preprocessor/compiler that generates object and executable files. (The name of this macro may be different for your makefile.)
`LINK32`	The linker that is used.

The `nmake` command creates object files (`.obj`) and executable files () from the information specified in the `your_project.mak` makefile.

Modify Your makefile (Windows)

Use Compiler Options

A compiler option is a case-sensitive, command line expression used to change the compiler's default operation. Compiler options are not required to compile your program, but they can control different aspects of your application, such as:

- Code generation
- Optimization
- Output file (type, name, location)
- Linking properties
- Size of the executable
- Speed of the executable

Linux and macOS

When you specify compiler options on the command line, the following syntax applies:

```
[invocation] [option] [@response_file] file1 [file2...]
```

The *invocation* is `icc`.

The *option* represents zero or more compiler options and the *file* is any of the following:

- C or C++ source file (`.C`, `.c`, `.cc`, `.cpp`, `.cxx`, `.c++`, `.i`, `.ii`)
- Assembly file (`.s`, `.S`)
- Object file (`.o`)
- Static library (`.a`)

When compiling C language sources, invoke the compiler with `icc`. When compiling C++ language sources or a combination of C and C++, invoke the compiler with `icpc`.

Windows

When you specify compiler options on the command line, the following syntax applies:

```
[invocation] [option] [@response_file] file1 [file2 ...] [/link linker_option]
```

The *invocation* is `icl`.

The *option* represents zero or more compiler options, the *linker_option* represents zero or more linker options, and the *file* is any of the following:

- C or C++ source file (`.c`, `.cc`, `.ccp`, `.cxx`, `.i`)
- Assembly file (`.asm`)
- Object (`.obj`)
- Static library (`.lib`)

The optional *response_file* is a text file that lists the compiler options you want to include during compilation. See Use Response Files for additional information.

Default Operation

The compiler invokes many options by default. In this example, the compiler includes the option `O2` (and other default options) in the compilation. Using C++ as an example:

Linux and macOS

```
icpx main.c
```

Windows

```
icx main.c
```

Each time you invoke the compiler, options listed in the corresponding configuration file override any competing default options. For example, if your configuration file includes the `O3` option, the compiler uses `O3` rather than the default `O2` option. Use the configuration file to list the options for the compiler to use for every compilation. See Using Configuration Files.

Options specified in the command line environment variable override any competing default options and options listed in the configuration file.

Finally, options used on the command line override any competing options that may be specified elsewhere (default options, options in the configuration file, and options specified in the command line environment variable). If you specify the option `O1` this option setting takes precedence over competing option defaults and competing options in the configuration files, in addition to the competing options in the command line environment variable.

Certain `#pragma` statements in your source code can override competing options specified on the command line. If a function in your code is preceded by `#pragma optimize("", off)`, then optimization for that function is turned off. The override is valid even when the `O2` optimization is on by default, the `O3` is listed in the configuration file, and the `O1` is specified on the command line for the rest of the program.

Use Competing Options

The compiler reads command line options from left to right. If your compilation includes competing options, then the compiler uses the one furthest to the right. Using C++ as an example:

Linux and macOS

```
icpc -xSSSE3 main.c file1.c -xSSE4.2 file2.c
```

Windows

```
icl /QxSSSE3 main.c file1.c /QxSSE4.2 file2.c
```

The compiler sees `[Q]xSSSE3` and `[Q]xSSE4.2` as two forms of the same option, where only one form can be used. Since `[Q]xSSE4.2` is last (furthest to the right), it will be used.

All options specified on the command line are used to compile each file. The compiler does not compile individual files with specific options. For example:

Linux and macOS

```
icc -O3 main.c file1.c -mp1 file2.c
```

Windows

```
icl /O3 main.c file1.c /Qprec file2.c
```

It may seem that `main.c` and `file1.c` are compiled with the option `O3`, and `file2.c` is compiled with the `-mp1` (Linux and macOS) or `/Qprec` (Windows) option. This is not correct; all files are compiled with both options.

A rare exception to this rule is the `-x` *type* option on Linux and macOS. Using C++ as an example:

Linux and macOS

```
icpc -x c file1 -x c++ file2 -x assembler file3
```

The *type* argument identifies each file type for the compiler.

Use Options with Arguments

Compiler options can be as simple as a single letter, such as the option `E`. Many options accept or require arguments. The `O` option, for example, accepts a single-value argument that the compiler uses to determine the degree of optimization. Other options require at least one argument and can accept multiple arguments. For most options that accept arguments, the compiler warns you if your option and argument are not recognized. If you specify `O9`, the compiler issues a warning, then ignores the unrecognized option `O9`, and proceeds with the compilation.

The `O` option does not require an argument, but there are other options that must include an argument. The `I` option requires an argument that identifies the directory to add to the include file search path. If you use this option without an argument, the compiler will not finish its compilation.

Other Forms of Options

You can toggle some options on or off by using the negation convention. For example, the `[Q]ipo` option (and many others) includes negation forms, `-no-ipo` (Linux and macOS) and `/Qipo-` (Windows), to change the state of the option.

Option Categories

When you invoke the Intel® C++ Compiler Classic and specify a compiler option, you have a wide range of choices to influence the compiler's default operation. Intel® C++ Compiler Classic options typically correspond to one or more of the following categories:

- Advanced Optimization
- Code Generation
- Compatibility
- Compiler Diagnostics
- Component Control
- Data
- Floating Point
- Inlining
- Interprocedural Optimizations (IPO)
- Language

- Linking/Linker
- Miscellaneous
- OpenMP and Parallel Processing
- Optimization
- Optimization Report
- Output
- Preprocessor

To see the included options in each category, invoke the compiler from the command line with the `help` category option. For example:

Linux and macOS

```
icc -help codegen
```

Windows

```
icl /help codegen
```

The help option prints to `stdout` with the names and syntax of the options found in the Code Generation category.

Use Configuration Files

Specify Compiler Files

Specify Include Files

The compiler searches the default system areas for include files and items specified by the `I` compiler option. The compiler searches directories for include files in the following order:

1. Directories specified by the `I` option.
2. Directories specified in the environment variables.
3. Default include directories.

Use the `-nostdinc` (Linux) or `X` (Windows) option to remove the default directories from the include file search path.

For example, to direct the compiler to search the path `/alt/include` instead of the default path, use the following:

Linux and macOS

```
icpc -nostdinc -I/alt/include prog1.cpp
```

Windows

```
icl /X /I\alt\include prog1.cpp
```

Specify Assembly Files

You can use the `-S` and `-o` options (Linux and macOS) or `/Fa` option (Windows) to specify an alternate name for an assembly file. The compiler generates an assembly file named `myasm.s` (Linux and macOS) or `myasm.asm` (Windows):

Linux and macOS

```
icpc -S -o myasm.s x.cpp
```

Windows

```
icl /Famyasm x.cpp
```

Specify Object Files

You can use the `-c` and `-o` options (Linux and macOS) or `/Fo` option (Windows) to specify an alternate name for an object file. In this example, the compiler generates an object file name `myobj.o` (Linux and macOS) or `myobj.obj` (Windows):

Linux and macOS

```
icpc -c -o myobj.o x.cpp
```

Windows

```
icl /Fomyobj x.cpp
```

`/Fa` compiler option
`/Fo` compiler option
I compiler option
`-o` compiler option
`-S` compiler option
X compiler option
Supported Environment Variables

Convert Projects to Use a Selected Compiler

You can use the command-line interface `ICProjConvert<version>.exe` to transform your Intel® C++ projects into Microsoft Visual C++* projects, or vice versa. The syntax is:

```
ICProjConvert<version>.exe <sln_file | prj_files> </VC[:"VCtoolset name"] | /IC[:"ICtoolset
name"]> [/q] [/nologo] [/msvc] [/s] [/f]
```

Where:

Parameter	Description
`version`	The `ICProjConvert` version number. Values are: 191 or 192.
`sln_file`	A path to the solution file, which should be modified to use a specified project system.
`prj_files`	A space separated list of project files (or wildcard), which should be modified to use specified project system.
`/VC`	Convert to use the Microsoft Visual C++ project system.
VCtoolset name	The possible values are `v141` (Microsoft Visual Studio* 2017), `v142` (Microsoft Visual Studio 2019), or `v143` (Microsoft Visual Studio 2022). **NOTE** Support for Microsoft Visual Studio 2017 is deprecated as of the Intel® oneAPI 2022.1 release, and will be removed in a future release.
`/IC`	Convert to use the Intel® C++ project system.

Parameter	Description
ICtoolset name	Such as `Intel C++ Compiler 2021.1` Depending on the integration version, the supported name values may be different.
`/q`	Starts quiet mode, all information messages (except errors) are hidden.
`/nologo`	Suppresses the startup banner.
`/msvc`	Sets the compiler to Microsoft Visual C++.
`/s`	Searches the project files through all subdirectories.
`/f`	Forces an update to the project even if it has an unsupported type or unsupported properties.
`/?` or `/h`	Shows help.

Example

Issue the command `ICProjConvert<version>.exe` *.icproj `/s /VC` to convert all Intel® C++ project files in the current directory and its subdirectories to use Microsoft Visual C++.

> **NOTE** If you uninstall the Intel® C++ Compiler Classic, `ICProjConvert<version>.exe` remains in the folder `Program Files (x86)\Common Files\Intel\shared files\ia32\Bin` and you can use it to transform Intel® C++ projects back into Microsoft Visual C++.

*Use Eclipse**

The Intel® C++ Compiler for Linux* provides integrations for the compiler to Eclipse* and C/C++ Development Tooling* (CDT) that let you develop, build, and debug your Intel® C++ projects in an integrated development environment (IDE).

Eclipse is an open source software development project dedicated to providing a robust, full-featured, commercial-quality, industry platform for the development of highly integrated tools. It is an extensible, open source integrated development environment (IDE). CDT is a complete C/C++ IDE for the Eclipse platform, which allows you to develop, build, and run projects in a visual, interactive environment. CDT is layered on Eclipse and provides a C/C++ development environment perspective.

Add the Compiler to Eclipse*

This step is needed only if you are manually installing the Intel® C++ Compiler plug-in for Eclipse*.

To add the Intel® C++ Compiler product extension to your Eclipse configuration:

1. Start Eclipse.
2. Select **Help** > **Install New Software**.
3. Next to the **Work with** field, click the **Add** button. The **Add Repository** dialog box opens.
4. Click the **Archive** button and browse to the `<install_dir>/compiler/<version>/linux/ide_support` directory. Select the `.zip` file that starts with `com.intel.compiler`, then click **OK**.
5. Select **Intel® Software Development Tools** > **Intel® C++ Compiler Integration**, then click **OK**.
6. Follow the installation instructions.
7. When asked if you want to restart Eclipse, select **Yes**.

When Eclipse restarts, you can create and work with CDT projects that use the Intel® C++ Compiler.

Multi-Version Compiler Support

You can select different versions of the Intel® C++ Compiler for compiling projects with the Eclipse* Integrated Development Environment (IDE). For a list of the currently supported compiler versions by platform, refer to the Release Notes.

If multiple versions of the compiler are installed on the system, Eclipse uses the latest version by default. To select the version of the compiler to build your project:

1. Right click the project and open **Properties**.
2. In the properties dialog box, select **C/C++ Build** > **Settings**.
3. Select the **Intel® C++ Compiler Classic** for a C++ project tab.
4. Select the row with the desired compiler version.
5. Click **Use Selected**. Alternatively, click **Use Latest** to select the latest version of compiler.
6. Click **Apply**.

The corresponding compiler environment is configured automatically for your project.

Use **Settings** and **Tool Chain Editor** to select tools to be used within the toolchain, or set distinct project properties, like compiler options, to be used with different versions of the compiler.

For any project, you can set the compiler environment by specifying it within Eclipse; this overrides any other environment specifications for the compiler.

Use Cheat Sheets

The Intel® C++ Compiler Classic integration includes several Eclipse* cheat sheets that can guide you through various compilation and debugging tasks.

To view a list of available cheat sheets and select one:

1. Select **Help** > **Cheat Sheets**.
   The **Cheat Sheet Selection** dialog box opens, displaying a list of available cheat sheets.
2. Select a cheat sheet. Cheat sheets located outside of the Eclipse* integration can be entered in the **Select a cheat sheet from a file** or **Enter the URL of a cheat sheet**.
   Intel cheat sheets are located under **Intel(R) C++ Compiler**. A description of the cheat sheet appears in the lower pane.
3. To open a cheat sheet, click **OK**.

The **Cheat Sheets** view opens in the Eclipse window.

Create a Simple Eclipse Project

The sections below show you how to create a simple project using Eclipse.

Create a New Eclipse Project

To create an Eclipse project:

1. Select **File** > **New** > **Project...** The **New Project** wizard opens.
2. Expand the **C/C++ Project** tab and select the appropriate project type. Click **Next** to continue.
3. For **Project name**, enter hello_world. Deselect the **Use default location** to specify a directory for the new project.
4. In the **Project Type** list, expand the **Executable** project type and select **Hello World C++ Project** for C++.
5. In the **Toolchains** list, select **Intel C++ Compiler Classic**. Click **Next**.

NOTE

- If you need to see the toolchains for the compilers that are not locally installed, uncheck **Show project types and toolchains only if they are supported on the platform**. You are only able to view and configure these toolchains if the proper compilers are installed.
- If you have multiple versions of the compiler installed, they appear in the project's properties under **C/C++ Build** > **Settings** on the **Intel® C++ Compiler Classic** tab.

6. The **Basic Settings** page allows specifying template information, including **Author** and **Copyright notice**, which appear as a comment at the top of the generated source file. After entering desired fields, click **Next**.
7. The **Select Configurations** page allows specifying deployment platforms and configurations. By default, a **Debug** and **Release** configuration is created for the selected toolchain. Select no (**Deselect all**), multiple, or all (**Select all**) configurations. To edit project properties, click the **Advanced settings** button. Click **Finish** to create the `hello_world` project. Configurations can be created after the project is created by selecting **Project** > **Properties**.
8. If the view is not the **C/C++ Development Perspective** (default), an **Open Associated Perspective** dialog box opens. In the **C/C++ Perspective**, click **Yes** to proceed.

An entry for your `hello_world` project appears in the **Project Explorer** view.

Add a C Source File

To add a source file to the `hello_world` project:

1. Select the `hello_world` project in the **Project Explorer** view.
2. Select **File** > **New** > **Source File**. The **New Source File** dialog box opens. The dialog box automatically populates the source folder for the source file to be created. You can change this by entering a new location or selecting **Browse**.
3. Enter `new_source_file.c` in the **Source File** field.
4. Select a **Template** from the drop-down list or **Configure** a new template.
5. Click **Finish** to add the file to the `hello_world` project.
6. In the **Editor** view, add your code for `new_source_file.c`.
7. When your code is complete, **Save** your file.

Set Options for a Project or File

You can specify compiler, linker, and archiver options at the project and source file level. Follow these steps to set options for a project or file:

1. Right-click a project or source file in the **Project Explorer**.
2. Select **Properties**. The property pages dialog box opens.
3. Select **C/C++ Build** > **Settings**.
4. Select the **Tool Settings** tab and click an option category for **Intel C Compiler**, **Intel C++ Compiler**, or **Intel C++ Linker** for a C++ project.
5. Set the options to apply to the project or file.

NOTE

- Some properties use check boxes, drop-down boxes, or dialog boxes to specify compiler options. For a description on options properties, hover over the option to display a tooltip. After setting the desired options in command line syntax, select **Apply**.
- To specify an option that is not available from the **Properties** dialog, use **C/C++ Build Settings** > **Settings** > **<Compiler>** > **Command Line**. Enter the command line options in the **Additional Options** field using command-line syntax and select **Apply**.
- You can specify option settings for one or more configurations by using the **Configuration** drop-down menu.

6. Click **Apply and Close**.

The compiler applies the selected options, using the selected configurations, when building. To restore default settings to all properties for the selected configuration, click the **Restore Defaults** button on any property page.

Exclude Source Files from a Build

To exclude a source file from a build:

1. Right-click a file or folder in the **Project Explorer**.
2. Select **Resource Configurations** > **Exclude from build**. The **Exclude from build** dialog box opens.
3. Select one or more build configurations to exclude the file or folder from.
4. Click **OK**.

The compiler excludes that file or folder when it builds using the selected project configuration.

Build a Project

To build your project:

1. Select the `hello_world` project in the **Project Explorer** view.
2. Select **Project** > **Build Project**.

See the **Build** results in the **Console** view.

For a C/C++ project, use:

```
**** Build of configuration Debug for project hello_world ****
make all
Building file: ../src/hello_world.cpp
Invoking: Intel(R) C++ Compiler Classic
icpc -g -O0 -MMD -MP -MF"src/hello_world.d" -MT"src/hello_world.d" -c -o "src/hello_world.o"
"../src/hello_world.cpp"
Finished building: ../src/hello_world.cpp

Building target: hello_world
Invoking: Intel C++ Linker
icpc -O0 -o "hello_world"  ./src/hello_world.o
Finished building target: hello_world

Build Finished. 0 errors, 0 warnings.
```

Detailed descriptions of errors, warnings, and other output can be viewed by selecting the **Problems** tab.

Run a Project

After building a project, you can run your project by following these steps:

1. Select the `hello_world` project in the **Project Explorer** view.

2. Select **Run As** > **Local C/C++ Application**.

When the executable runs, the output appears in the **Console** view.

Error Parser

The Error Parser (selected by default) lets you track compile-time errors in Eclipse. To confirm that the Error Parser is active:

1. Select the `hello_world` project in the **Project Explorer** view.
2. Select **Project** > **Properties**.
3. In the **Properties** dialog box, select **C/C++ Build** > **Settings**.
4. Click the **Error Parsers** tab. Make sure that **Intel C++ Error Parser** is checked, and **CDT Visual C Error Parser** or **Microsoft Visual C Error Parser** are not checked.
5. Click **OK** to update your choices, if you have changed any settings.

Use the Error Parser

The Error Parser automatically detects and manages the diagnostics generated by the Intel® C++ Compiler Classic.

If an error occurring in the `hello_world.c` program is compiled, for example, `#include <xstdio.h>`, the error is reported in the **Problems** view next to an error marker.

You can double-click each error in the **Problems** view to highlight the source line, which causes the error in the **Editor** view.

Correct the error, then rebuild your project.

Makefiles

This section provides information about makefile project types and exporting makefiles.

Project Types and Makefiles

When you create a new project in Eclipse*, there are **Executable**, **Shared Library**, **Static Library**, or **Makefile** project types available for your selection.

- Select **Makefile Project** if the project already includes a makefile.
- Use **Executable**, **Shared Library**, or **Static Library Project** to build a makefile using options assigned from property pages specific to the Intel® C++ Compiler Classic.

Export Makefiles

Eclipse can build a makefile that includes Intel® C++ Compiler Classic options for created **Executables**, **Shared Libraries**, or **Static Library** Projects. When the project is complete, export the makefile and project source files to another directory, and then build the project from the command line using `make`.

To export the makefile:

1. Select the project in the Eclipse **Project Explorer** view.
2. Select **File** > **Export** to launch the **Export Wizard**. The **Export** dialog box opens, showing the **Select** screen.
3. Select **General** > **File system**, then click **Next**. The **File System** screen opens.
4. Check both the **hello_world** and **Release** directories in the left-hand pane. Ensure all project sources are checked in the right-hand pane.

NOTE Some files in the right-hand pane may be deselected, such as the `hello_world.o` object file and the `hello_world` executable. **Create directory structure for files** in the **Options** section must be selected to successfully create the export directory. This process applies to project files in the `hello_world` directory.

5. Use the **Browse** button to target the export to an existing directory. Eclipse can create a directory for full paths entered in the **To directory** text box. For example, if the `/code/makefile` is specified as the export directory, Eclipse creates two new subdirectories:
   - `/code/makefile/hello_world`
   - `/code/makefile/hello_world/Release`
6. Click **Finish** to complete the export.

Run Make

In a terminal window, change to the `/cpp/hello_world/Release` directory, then run `make` by typing: `make clean all`.

You should see the following output:

```
rm -rf  ./new_source_file.o  ./new_source_file.d  hello_world

Building file: ../new_source_file.c
Invoking: Intel(R) C Compiler Classic
icc -O2 -MMD -MP -MF"new_source_file.d" -MT"new_source_file.d" -c -o "new_source_file.o" "../
new_source_file.c"
Finished building: ../new_source_file.c

Building target: hello_world
Invoking: Intel C++ Linker
icc -o "hello_world"  ./new_source_file.o
Finished building target: hello_world
```

This process generates the `hello_world` executable in the same directory.

Use Intel Libraries with Eclipse*

You can use the compiler with the following Intel Libraries, which that may be included as a part of the product:

- Intel® oneAPI Data Analytics Library (oneDAL)
- Intel® Integrated Performance Primitives (Intel® IPP)
- Intel® oneAPI Math Kernel Library (oneMKL)
- Intel® oneAPI Threading Building Blocks (oneTBB)

To access these libraries in Eclipse*, use the property pages:

1. Select your project.
2. Open the property pages from **Project** > **Properties** and select **C/C++ Build** > **Settings**.
3. Select **Intel C/C++ Compiler** > **Performance Library Build Components**

The **Use Intel® oneAPI Data Analytics Library** (oneDAL) property allows enabling the library and bringing in the associated headers.

- **None**: Disable Use of oneDAL.
- **Use threaded Intel® oneDAL**: Link using the threaded version of the library.
- **Use non-threaded Intel® oneDAL**: Link using the non-threaded version of the library.

The **Use Intel® Integrated Performance Primitives Libraries** property provides the following options in a drop-down menu:

- **None**: Disable use of Intel® IPP.
- **Use main libraries set**: Link using the main libraries set.

- **Use non-pic version of libraries**: Link using the version of the libraries that do not have position-independent code.
- **Use main libraries and cryptography library**: Link using main or cryptography libraries.

The **Use Intel® oneAPI Math Kernel Library** property provides the following options in a drop-down menu:

- **None**: Disables the use of the oneMKL.
- **Use threaded Intel® oneMKL library**: Link using the threaded version of the library.
- **Use non-threaded Intel® oneMKL library**: Link using the non-threaded version of the library.
- **Use Intel® oneMKL Cluster and sequential Intel® oneMKL libraries**: Link using the oneMKL Cluster Edition libraries and the sequential oneMKL libraries.

> **NOTE** The option value **Use Intel® oneMKL Cluster and sequential Intel® oneMKL libraries** is only available for Intel C Compiler or Intel C++ Compiler.

The **Use Intel® oneAPI Threading Building Blocks** on the **Property** page allows enabling the library and bringing in the associated headers.

For more information, see the oneDAL, Intel® IPP, oneMKL, and oneTBB documentation.

Product and Performance Information
Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex. Notice revision #20201201

*Using Microsoft Visual Studio**

You can use the Intel® C++ Compiler within the Microsoft Visual Studio* integrated development environment (IDE) to develop C++ applications, including static library (`.LIB`), dynamic link library (`.DLL`), and main executable (`.EXE`) applications. This environment makes it easy to create, debug, and execute programs. You can build your source code into several types of programs and libraries, using the IDE or from the command line.

The IDE offers these major advantages:

- Makes application development quicker and easier by providing a visual development environment.
- Provides integration with the native Microsoft Visual Studio debugger.
- Makes other IDE tools available.

Create a New Project

Create a New Project

When you create a project, Microsoft Visual Studio automatically creates a corresponding solution to contain it. To create a new Intel® C++ project using Microsoft Visual Studio:

> **NOTE** Exact steps may vary depending on the version of Microsoft Visual Studio in use.

1. Select **File** > **New** > **Project**.
2. In the left pane, expand **Visual C++** and select **Windows Desktop**.
3. In the right pane, select **Windows Console Application**.
4. Accept or specify a project name in the **Name** field. For this example, use hello32 as the project name.
5. Accept or specify the Location for the project directory. Click **OK**.

The `hello32` project assumes focus in the **Solution Explorer** view. The default Microsoft Visual Studio solution is also named `hello32`.

Use the Intel® C++ Compiler Classic

To use the compiler with Microsoft Visual C++* (MSVC):

1. Create a MSVC project, or open an existing project.
2. In **Solution Explorer**, select the project(s) to build with Intel® C++ Compiler Classic.
3. Open **Project** > **Properties**.
4. In the left pane, expand the **Configuration Properties** category and select the **General** property page.
5. In the right pane, change the Platform Toolset to **<compiler selection>**. Alternatively, you can change the toolset by selecting **Project** > **Intel Compiler** > **Use Intel C++ Compiler**. This sets whichever version of the compiler that you specify as the toolset for all supported platforms and configurations.

   NOTE For C/C++, there are two toolsets: Select **Intel C++ Compiler <major version>** (example 2021) to invoke `icx`, or select **Intel C++ Compiler <major.minor>** (example 19.2) to invoke `icl`.

6. To add options, go to **Project** > **Properties** > **C/C++** > **Command Line** and add new options to the **Additional Options** field. Alternatively, you can select options from Intel specific properties. Refer to complete list of options in the Compiler Options section in this documentation.
7. Rebuild, using either **Build** > **Project only** > **Rebuild** for a single project, or **Build** > **Rebuild Solution** for a solution.

Switch Back to the MSVC Compiler

If your project is using the Intel® C++ Compiler Classic, you can switch back to MSVC:

1. Select your project.
2. Right-click and select **Intel Compiler** > **Use Visual C++** from the context menu.

Verify Use of the Intel® C++ Compiler Classic

To verify the use of the Intel® C++ Compiler Classic:

1. Go to **Project** > **Properties** > **C/C++** > **General**.
2. Set **Suppress Startup Banner** to **No**. Click **OK**.
3. Rebuild your application.
4. Look at the **Output** window.

You should see a message similar to the following when using the Intel® C++ Compiler Classic:

```
Intel(R) C++ Intel(R) XX Compiler Classic for applications running on XXXX, Version XX.X.X
```

Unsupported MSVC Project Types

The following project types are not supported:

- Class Library
- CLR Console Application
- CLR Empty Project
- Windows* Forms Application
- Windows Forms Control Library

Tips for Use

- Create a separate configuration for building with Intel® C++ Compiler Classic:
  - After you have created your project and specified it as an Intel project, create a new configuration (for example, `rel_intelc` based on **Release** configuration or `debug_intelc` based on **Debug** configuration).
  - Add any special optimization options offered by Intel® C++ Compiler Classic only to this new configuration (for example, `rel_intelc` or `debug_intelc`) through the project property page.
- Build with Intel® C++ Compiler Classic.

Select the Compiler Version

If you have multiple versions of the installed, you can select which version you want from the **Compiler Selection** dialog box:

1. Select a project, then go to **Tools** > **Options** > **Intel Compilers and Libraries** > **Compilers**.
2. Use the **Selected Compiler** drop-down menu to select the appropriate version of the compiler.
3. Click **OK**.

See Also

Use Intel® C++ dialog box

Specify a Base Platform Toolset

By default, when your project uses the Intel® C++ Compiler Classic, the Base Platform Toolset property is set to use that compiler with the build environment. This environment includes paths, libraries, included files, etc., of the toolset specific to the version of Microsoft Visual Studio* you are using.

You can set the general project level property **Base Platform Toolset** to use one of the non-Intel installed platform toolsets as the base.

For example, if you are using Microsoft Visual Studio 2019, and you selected the Intel® C++ Compiler Classic in the Platform Toolset property, then the Base Platform Toolset uses the Microsoft Visual Studio 2019 environment (**v142**). If you want to use other environments from Microsoft Visual Studio along with the Intel® C++ Compiler Classic, set the **Base Platform Toolset** property to:

- **v141** for Microsoft Visual Studio 2017
- **v142** for Microsoft Visual Studio 2019
- **v143** for Microsoft Visual Studio 2022

> **NOTE**
> Support for Microsoft Visual Studio 2017 is deprecated as of the Intel® oneAPI 2022.1 release, and will be removed in a future release.

This property displays all installed toolsets, not including Intel toolsets.

To set the Base Platform Toolset:

- Using property pages:
  1. Select the project and open **Project** > **Properties**.
  2. In the left pane, select **Configuration Properties** > **General**.
  3. In the right pane, find **Intel Specific** > **Base Platform Toolset**.
  4. Select a value from the pop-up menu.
- Using the `msbuild.exe` command line tool, use the `/p:PlatformToolset` and `/p:BasePlatformToolset` options.

Example: When the Platform Toolset property is already set to use the Intel® C++ Compiler Classic, to build a project using the Microsoft Visual Studio 2019 environment use the following command:

```
Msbuild.exe myproject.vcxproj /p:BasePlatformToolset=v142
```

Example: To set the Platform Toolset property to use the Intel® C++ Compiler Classic and build a project using the Microsoft Visual Studio 2019 environment use the following command:

```
Msbuild.exe myproject.vcxproj /p:PlatformToolset="Intel C++ Compiler 19.2" /
p:BasePlatformToolset=v141
```

For possible values for the `/p:BasePlatformToolset` property, see the properties described above.

The next time you build your project with the Intel® C++ Compiler Classic, the option you selected is used to specify the build environment.

Use Property Pages

The Intel® C++ Compiler Classic includes support for Property Pages to manage both Intel-specific and general compiler options.

To set compiler options in Microsoft Visual Studio*:

1. Right-click on a project or source file in the **Solution Explorer** view.
2. Select **Properties** from the pop-up menu.
3. In the **Property Pages** dialog box, expand the **C/C++** section to view the categories of compiler options.
4. Click **OK** to complete your selection.

The option you selected is used in the compilation the next time you build your project.

Use Intel® Libraries with Microsoft Visual Studio*

You can use the compiler with the following Intel® Libraries, which may be included as a part of the product:

- Intel® oneAPI Data Analytics Library (oneDAL)

  NOTE This library is only available in the x64 configuration.

- Intel® Integrated Performance Primitives (Intel® IPP)
- Intel® oneAPI Threading Building Blocks (oneTBB)
- Intel® oneAPI Math Kernel Library (oneMKL)

Use the property pages to specify Intel Libraries to use with the selected project configuration. The functionality supports Intel® C++ and Microsoft Visual C++* project types.

To specify Intel Libraries, select **Project** > **Properties**. In **Configuration Properties**, select **Intel Libraries for oneAPI**, then do the following:

1. To use **oneDAL** change the **Use oneDAL** settings as follows:

   NOTE This library is only available in the x64 configuration.

   - **No**: Disable Use of oneDAL.
   - **Default Linking Method**: Use parallel dynamic oneDAL libraries.
   - **Multi-threaded Static Library**: Use parallel static oneDAL libraries.
   - **Single-threaded Static Library**: Use sequential static oneDAL libraries.
   - **Multi-threaded DLL**: Use parallel dynamic oneDAL libraries.
   - **Single-threaded DLL**: Use sequential dynamic oneDAL libraries.
2. To use **Intel® Integrated Performance Primitives**, change the **Use Intel® IPP** settings as follows:

- **No**: Disable use of Intel® IPP libraries.
- **Default Linking Method**: Use dynamic Intel® IPP libraries.
- **Static Library**: Use static Intel® IPP libraries.
- **Dynamic Library**: Use dynamic Intel® IPP libraries.

3. To use **oneTBB** in your project, change the **Use oneTBB** settings as follows:

   - **No**: Disable use of oneTBB libraries.
   - **Use oneTBB**: Set to **Yes** to use oneTBB in the application.
   - **Instrument for use with Analysis Tools**: Set to **Yes** to analyze your release mode application (not required for debug mode).

4. To use **oneMKL** in your project, change the **Use oneMKL** property settings as follows:

   - **No**: Disable use of oneMKL libraries.
   - **Parallel**: Use parallel oneMKL libraries.
   - **Sequential**: Use sequential oneMKL libraries.
   - **Cluster**: Use cluster libraries.

Additional settings for use with the Microsoft Visual C++* Platform Toolset are available on the **Intel Libraries for oneAPI** category, found at **Tools** > **Options**.

NOTE The **Use <library>** properties in Microsoft Visual Studio mimic the behavior of the `/Qmkl`, `/Qdaal`, `/Qipp` and `/Qtbb` compiler options. The include and library paths to the performance library, which are installed with the selected compiler, are set up with these properties.

Change the Selected Intel® Performance Libraries

If you have installed multiple versions of the Intel® Performance Libraries, you can specify which version to use with the Microsoft Visual C++* compiler. To do this:

1. Select **Tools** > **Options**.
2. In the left pane, select **Intel Compilers and Libraries** > **Performance Libraries**.
3. Select the desired library version from the drop-down boxes in the right pane.

For more information, see the Intel® oneAPI Data Analytics Library (oneDAL), Intel® Integrated Performance Primitives (Intel® IPP), Intel® oneAPI Threading Building Blocks (oneTBB), and Intel® oneAPI Math Kernel Library (oneMKL) documentation.

Include MPI Support

To specify the type of MPI support you want:

1. Open the project's property pages and select **Configuration Properties** > **Intel Libraries for oneAPI**.
2. Set the property **Use oneMKL** to **Cluster**.
3. Set the property **Use MPI Library** to one of the following values:

   - **Intel® MPI Library**
   - **MS-MPI**

4. Build the project.

The next time you build your project with the Microsoft Visual C++* compiler, it will include support for the version of MPI that you specified.

Use Guided Auto Parallelism in Microsoft Visual Studio*

The Guided Auto Parallelism (GAP) feature helps you locate portions of your serial code that can be parallelized. When you enable analysis using GAP, the compiler guides you to places in your code where you can increase efficiency through automatic parallelization and vectorization.

NOTE GAP is not supported for `ifx`.

Run Analysis on a Project

You can start analysis from the Microsoft Visual Studio* IDE in several ways:

- From the **Tools** menu: Select **Intel Compiler** > **Guided Auto Parallelism** > **Run Analysis...**

  Starting analysis in this way results in a one-time run for the current project. The default values are taken from **Tools** > **Options** unless you have chosen to override them in the dialog box.
- From the Diagnostics property page: Use the **Guided Auto Parallelism Analysis** property.

  Specifically, choose **Project** > **Properties** > **C/C++** > **Diagnostics** and enable analysis using the **Guided Auto Parallelism Analysis** property. Enabling analysis in the property page allows you to run an analysis as part of a normal project **Build** request in Microsoft Visual Studio*. In this mode, GAP-related settings in **Tools** > **Options** are ignored, in favor of other GAP-related settings available in the property page.
- From the context menu: Right-click and select **Intel Compiler** > **Guided Auto Parallelism** > **Run Analysis...**.

  This is equivalent to using the **Guided Auto Parallelism** > **Run Analysis** option on the **Tools** menu.

To receive advice for auto parallelization, be sure that certain property page settings are correct. Select **Project** > **Properties** > **C/C++** > **Optimization [Intel C++]** and set **Parallelization** to **Yes** to enable auto-parallelization optimization. You may also need to set the **Optimization** level at option `O2` or higher. To do this, use the **Optimization** property page.

GAP Scenarios

To illustrate how the various GAP settings work together, consider the following scenarios:

Scenario	Result
The GAP analysis setting in the property pages is set to Enabled.	Analysis always occurs for the project, whenever a regular project build occurs. Other analysis settings specified in the property pages are used. Analysis setting in **Tools** > **Options** are ignored.
The Gap analysis setting in the property pages is set to Disabled, and GAP is run from the **Tools** menu.	Analysis occurs for this one run. The default values for this analysis are taken from **Tools** > **Options** and can be overridden in the dialog box. Options specified in the property pages are also used, but will be overridden by any specified analysis option.
The GAP analysis setting in the property pages is set to Disabled, and GAP options are set in **Tools** > **Options**.	No analysis occurs, unless analysis is explicitly run from the **Tools** menu.

Run Analysis on a File or within a File

Right-click on **Guided Auto Parallelism** context menu item to run analysis on the following:

- **Single file:** Select a file and right-click.
- **Function (routine):**Right-click within the function scope.
- **Range of lines:** Select one or more lines for analysis and right-click.

Using Guided Auto Parallelism

Use Code Coverage in Microsoft Visual Studio*

The code coverage tool provides the ability to determine how much application code is executed when a specific workload is applied to the application. The tool analyzes static profile information generated by the compiler, as well as dynamic profile information generated by running an instrumented form of the application binaries on the workload. The tool can generate a report in HTML-format and export data in both text- and XML-formatted files. The reports can be further customized to show color-coded, annotated source-code listings that distinguish between used and unused code.

> **NOTE** Code coverage is not supported for `ifx`.

To start code coverage:

1. Select **Tools** > **Intel Compiler** > **Code Coverage...**
2. Specify settings for the various phases.
3. Click **Run**.

The **Output** window shows the results of the coverage and a general summary of information from the code coverage.

Use Profile Guided Optimization in Microsoft Visual Studio*

Profile Guided Optimization (PGO) improves application performance by reorganizing code layouts to reduce instruction-cache problems, shrinking code size, and reducing branch misprediction. PGO provides information to the compiler about areas of an application that are most frequently executed. By knowing these areas, the compiler is able to be more selective and specific in optimizing the application.

> **NOTE** PGO is not supported for `ifx`.

To start PGO:

1. Choose **Tools** > **Intel Compiler** > **Profile Guided Optimization...**
2. Specify settings for the various phases.
3. Click **Run**.

The **Output** windows show the results of the optimization with a link to the composite log.

Optimization Reports

Enable in Microsoft Visual Studio*

Optimization reports can help you address vectorization and optimization issues.

When you build a solution or project, the compiler generates optimization diagnostics. You can view the optimization reports in the following windows:

- The **Compiler Optimization Report** window, either grouped by loops or in a flat format.
- The **Compiler Inline Report** window.
- The optimization annotations, which are integrated within the source editor.

To enable viewing for the optimization reports:

1. In your project's property pages, select **Configuration Properties** > **C/C++** > **Diagnostics [Intel C ++]**.
2. Set a non-default value for any of the following options:
   - **Optimization Diagnostics Level**
   - **Optimization Diagnostics Phase**
   - **Optimization Diagnostics Routine**
3. Build your project to generate an optimization report.

When the compiler generates optimization diagnostics, the **Compiler Optimization Report** and the **Compiler Inline Report** windows open. The optimization report annotations appear in the source editor.

> **NOTE** You can specify how you want the optimization reporting to appear with the **Optimization Reports** dialog box. Access this dialog box by selecting **Tools** > **Options** > **Intel Compilers and Libraries** > **Optimization Reports**.

View Reports

When the compiler generates optimization diagnostics, the **Compiler Optimization Report** and the **Compiler Inline Report** windows open, and optimization report annotations appear in the editor.

The **Compiler Optimization Report** window displays diagnostics for the following phases of the optimization report:

- PGO
- LNO
- PAR
- VEC

- Offload (Linux* only)
- OpenMP*
- CG

Information appears in this window grouped by loops, or in a flat format. To switch the presentation format, click the gear button on the toolbar of the window, and uncheck **Group by loops**.

In addition to sorting information by clicking column headers and resizing columns, you can use the windows described in the following table:

Do This	To Do This
Double-click a diagnostic.	Jump to the corresponding position in the editor.
Click a link in the **Inlined into** column.	Jump to the call site of the function where the loop is inlined.
Expand or collapse a diagnostic in **Group by loops** view.	View detailed information for the diagnostic.
Click on a column header.	Sort the information according to that column.
Click the filter button.	Select a scope by which to filter the diagnostics that appear in the window. The title bar of the **Compiler Optimization Report** window shows the applied filter. Labels on optimization phase filter buttons show how many diagnostics of each phase are in the current scope.
Click a **Compiler Optimization Report** window toolbar button corresponding to an optimization report phase.	Turn filtering diagnostics on or off for an optimization phase. Labels on optimization phase filter buttons show the total number of diagnostics for each phase. By default all phases turned on.
Enter text in the search box in the **Compiler Optimization Report** window toolbar.	Filter diagnostics using the text pattern. Diagnostics are filtered when you stop typing. Pressing Enter saves this pattern in the search history. To disable filtering, clear the search box. To use a pattern from the search history, click on the down arrow next to the search box.

The **Compiler Inline Report** window displays diagnostics for the IPO phase of the optimization report.

Information appears in this window in a tree. Each entry in the tree has corresponding information in the right-hand pane under the **Properties** tab and the **Inlining options** tab.

You can use the window as described in the following table:

Do This	To Do This
Double-click a diagnostic in the tree, or click on the source position link under the **Properties** tab.	Jump to the corresponding position in the editor.
Click **Just My Code**.	Only display functions from your code, filter all records from files that don't belong to the current solution file tree.
Right-click on a function body in the editor and select **Intel Compiler** > **Show Inline report for *function name***.	View detailed information for the specified function.

Do This	To Do This
Right-click on a function body in the editor and select **Intel Compiler** > **Show where *function name* in inlined**.	Show where the specified function is inlined.
Enter text in the search box in the **Compiler Inline Report** window toolbar.	Filter diagnostics using the text pattern. Diagnostics are filtered when you stop typing. Pressing Enter saves this pattern in the search history. To disable filtering, clear the search box. To use a pattern from the search history, click on the down arrow next to the search box.

The **Viewing Optimization Notes** window in the editor provides context for the diagnostics that the compiler generates:

- In Caller Site
- In Callee Site
- In Caller and Callee Site

You can use optimization notes as described in the following table:

Do This	To Do This

Right-click an optimization note	• Expand or collapse the current optimization note, or all of them.
	• Open the **Optimization Reports** dialog box to adjust settings for optimization report viewing. You can view optimization notes in one of the following locations:
	  • **Caller Site**
	  • **Callee Site**
	  • **Caller Site and Callee Site**

Double-click an optimization note heading.	Expand or collapse the current optimization note.
Double-click a diagnostic detail.	Jump to the corresponding position in the editor.
Click a hyperlink in the optimization note.	Show where the specified function is inlined.
Click the help **(?)** icon.	Get detailed help for the selected diagnostic. The default browser opens and, if you are connected to the internet, displays the help topic for this diagnostic.
Hover the mouse over a collapsed optimization note.	View a detailed tool tip about that optimization note.

Dialog Box Help

This section provides information about access to dialog boxes and information about compilers, libraries, and converter dialog boxes.

Options: Compilers dialog box

To access the **Compilers** page:

1. Open **Tools** > **Options**.
2. In the left pane, select **Intel Compilers and Libraries** > **C++** > **Compilers**.

Compiler Selection for C++ Classic

Target Platform: Select your target platform.

Platform Toolset/Selected Compiler: Select your compiler for your platform toolset. The left column lists the platform toolset names. The right column lists combo boxes, which are used to select a compiler. The default value for all combo boxes in current table is **<Latest>**.

> **NOTE** The left column contains Intel® C++ Compiler Classic and Intel® oneAPI DPC++/C++ Compiler options. The **Intel C++ Compiler <major.minor>** (example 19.2) selects the Intel® C++ Compiler Classic (`icc`). The **Intel C++ Compiler <major>** (example 2021) selects the Intel® oneAPI DPC++/C++ Compiler (`icx`).

Default Options: Sets the default options for a selected compiler. You may specify this setting for each selected compiler.

Environment: Sets custom environment variables. You may specify this setting for each selected compiler.

> **NOTE** The Environment selection is only available for `icx`.

Compiler Information: Shows the detail description of the selected compiler.

Reset All: Sets all contents back to the default value on the dialog.

Use the Intel® C++ Compiler Classic

Options: Intel Libraries for oneAPI dialog box

Use the **Intel Libraries for oneAPI** dialog box to specify standalone library versions to use with the Microsoft Visual C++* compiler.

To access the **Intel Libraries for oneAPI** dialog box:

1. Open **Tools** > **Options**.
2. Select **Intel Compilers and Libraries** > **Intel Libraries for oneAPI**.

In the dialog box, you can select your desired library version from the drop-down box with one of the following values:

- **oneDAL**
- **Intel IPP**
- **oneTBB**
- **oneMKL**
- **Reset All**: Use the latest libraries (default)

> **NOTE** To enable or disable the Intel Libraries for oneAPI, use the property pages located in the **Configuration Properties** category.

Product and Performance Information
Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex. Notice revision #20201201

Options: Converter dialog box

To access the **Converter** page, click **Tools** > **Options** and then select **Intel Compilers and Libraries** > **C++** > **Converter**.

Use the **Converter** page to specify which platform toolset to use when upgrading an Intel® C++ solution (`.icproj`) from an older version of Microsoft Visual Studio* to a C++ project supported by Microsoft Visual Studio 2017 or later (`.vcxproj`). Once a solution is upgraded, the `.icproj` file is not used and can be deleted.

> **NOTE** Support for Microsoft Visual Studio 2017 is deprecated as of the Intel® oneAPI 2022.1 release, and will be removed in a future release.

Win32: Select the desired compiler version to be used when converting projects based on IA-32 architecture.

X64: Select the desired compiler version to be used when converting projects based on x64 architecture.

Reset All: Click this button to use the default platform toolsets.

Options: Optimization Reports dialog box

To access the **Optimization Reports** page, click **Tools** > **Options** and then select **Intel Compilers and Libraries** > **Optimization Reports**. Use this page to specify how you want optimization reporting to appear.

This page, in conjunction with the **Diagnostics** property page for your project or solution, defines settings for optimization report viewing in Visual Studio*.

General

Always Show Compiler Inline Report: Specify if the Compiler Inline Report appears after building or rebuilding your solution or project when inline diagnostics are present.

Always Show Compiler Optimization Report: Specify if Compiler Optimization Report appears after building or rebuilding your solution or project when optimization diagnostics are present. This option has higher priority than **Always Show Compiler Inline Report**. If both options are set to True, then this window has focus by default.

Show Optimization Notes in Text Editor Margin: Specify if optimization notes appear in the editor as source code annotations.

Optimization Notes in Text Editor

Collapse by Default: Specify if optimization notes appear expanded or collapsed by default.

Show Optimization Notes: Specify if source code annotations appear in the editor.

Site: Specify where optimization notes appear in the editor. Select from one of the following options:

- **Caller Site**
- **Callee Site**
- **Caller and Callee Sites**

Options: Guided Auto Parallelism dialog box

Use the **Guided Auto Parallelism** page to specify settings for Guided Auto Parallelism (GAP) analysis.

> **NOTE** The **Guided Auto Parallelism** dialog box is only available for `ifort`.

To access the **Guided Auto Parallelism** page click **Tools** > **Options** and then select: **Intel Compilers and Libraries** > **C++** > **Guided Auto Parallelism**.

These settings are used when running analysis using **Tools** > **Intel Compiler** > **Guided Auto Parallelism** > **Run Analysis on project...**

Guided Auto Parallelism Options

Level of Analysis: Specify the desired level of analysis. Choose **Simple**, **Moderate**, **Maximum**, or **Extreme**.

Suppress compiler warnings: Check this box to suppress compiler warnings. Selection adds option `W0` to the compiler command line.

Suppress Remark IDs: Specify one or more remark IDs to suppress. Use a comma to separate IDs.

Send remarks to a file: Check this box to send GAP remarks to a specified text file.

Remarks file: Specify the filename to send GAP remarks to.

Show all GAP configuration and informational dialogs: Check this box to display additional dialog boxes when you run an analysis.

Reset All: Click this button to restore the previously selected settings.

Profile-Guided Optimizations

Profile Guided Optimization dialog box

This topic has information on the following dialog boxes:

- **Profile Guided Optimization (PGO)** dialog box
- **Application Invocations** dialog box
- **Edit Command** dialog box
- **Command** dialog box

Profile Guided Optimization dialog box

To access the **Profile Guided Optimization** dialog box, choose **Tools** > **Intel Compiler** > **Profile Guided Optimization**.

Use the **Profile Guided Optimization** dialog box to set the options for profile guided optimization.

Phase 1 - Instrument: This phase produces an instrumented object file for the profile guided optimization. The command line compiler option for each optimization instrument you choose appears in **Compiler Options**.

- **Enable Function Ordering in the optimized application:** Select this checkbox to enable ordering of static and extern routines using profile information. This optimization specifies the order in which the linker should link the functions of your application. This optimization can improve your application performance by improving code locality and by reducing paging.
- **Enable Static Data Layout in the optimized application:** Select this checkbox to enable ordering of static global data items based on profiling information. This optimization specifies the order in which the linker should link global data of your program. This optimization can improve application performance by improving the locality of static global data, reduce paging of large data sets, and improve data cache use.
- **Instrument with guards for threaded application:** Select this checkbox to produce an instrumented object file that includes the collection of PGO data on applications that use a high level of parallelism.

Selecting an option produces a static profile information file (`.spi`), but also increases the time needed to do a parallel build.

Deselect the checkbox to skip this phase to save time running profile guided optimization. When you skip this phase, you use the existing profile information when running profile guided optimization. For example, you may want to skip this phase when you change the code to fix a bug and the fix doesn't affect the architecture of the project.

Phase 2 - Run Instrumented Application(s): This phase runs the instrumented application produced in the previous phase as well as other applications in the **Applications Invocations** dialog box. To add a new application or edit an existing application in the list, click **Applications Invocations**.

Deselect the checkbox to skip this phase to save time running profile guided optimization. When you skip this phase, you do not run the applications in the list when running profile guided optimization. For example, you might want to skip this phase when you change the code to fix a bug and the fix doesn't affect the architecture of the project.

Phase 3 - Optimize with Profile Data: This phase performs the profile guided optimization.

Deselect the checkbox to skip this phase.

Profile Directory: The directory that contains the profile. Click **Edit** to edit the profile directory or the **Browse** button to browse for the profile directory.

Show this dialog next time: Deselect this checkbox to run profile guided optimization without displaying this dialog box. The profile guided optimization will use these settings.

Save Settings: Click to save your settings.

Run: Click to start the profile guided optimization.

Cancel: Click to close this dialog box without starting the profile guided optimization.

Application Invocations dialog box

To access the **Application Invocations** dialog box, click **Application Invocations...** in the **Profile Guided Optimization** dialog box. Use the **Profile Guided Optimization** dialog box to configure the application options for your application as well add additional applications when you run profile guided optimization.

The list of applications comes from the debug settings of the **Startup Project**.

Merge Environment: Select this checkbox to merge the application environment with the environment defined by the operating system.

To add, edit, or remove an application, click one of the buttons.

Add: Click to add a new application in the **Add Command** dialog box.

Duplicate: Click after selecting an application to copy its settings so that you can use a different setting.

Edit: Click after selecting an application to change its settings in the **Edit Command** dialog box.

Delete: Click to remove the selected application from the list.

OK: Click to save the settings and close this dialog box.

Cancel: Click to discard the settings and close this dialog box.

Add Command dialog box

To access the **Add Command** dialog box, click **Add** in the **Application Invocations** dialog box. Use the **Add Command** dialog box to add a new application in the **Application Invocations** dialog box.

Command: Add a new or edit an existing application. Click **Edit** to open the **Command** dialog box with a list of macros. Click **Browse** to navigate to another directory that contains the application.

Command Arguments: Enter the arguments required by the application.

Working Directory: Enter a new or edit the working directory for the application. Click **Edit** to open the **Working Directory** dialog box with a list of macros. Click **Browse** to navigate to working directory of the application.

Environment: Enter the environment variable required by this application.

Merge Environment: Select this checkbox to merge the application environment with the environment defined by the operating system.

Load from Debugging Settings: Click to load the debug settings for this application.

OK: Click to save the settings and close this dialog box.

Cancel: Click to discard the settings and close this dialog box.

> **NOTE** The **Edit Command** and **Add Command** dialog boxes are similar. To use the **Edit Command** dialog box, substitute **Edit** for **Add** in the selections above.

Command dialog box

To access the **Command** dialog box, click **Edit** in the **Edit Command** dialog box, or **Add** in the **Add Command** dialog box. Use the **Command** dialog box to specify or change the macro used in the application to run as part of the profile guided optimization.

Select a macro from the list and then click one of the buttons.

Macro: Click to show or close the list of available macros.

Insert: Click to use the selected macro.

OK: Click to save the settings and close this dialog box.

Cancel: Click to discard the settings and close this dialog box.

Using Xcode* (macOS)

Create an Xcode* Project

To create a new Xcode* project:

1. Launch the Xcode application.
2. Select **File** > **New** > **Project...**

   The **Choose a template for your new project** window opens.
3. In the left pane, select **macOS** > **Application**.
4. Select a template, for example: **Command Line Tool**, and click **Next**.
5. Name your project, for example: Hello World, then enter a string for the **Organization Name** and **Organization Identifier** and select a language. Click **Next**.
6. Specify a directory for your project, and optionally select **Create local git repository for this project** to place your project under version control.
7. Click **Create**.

Xcode creates the named project directory, with an `.xcodeproj` extension. Your new project directory contains a `main.cpp` source file and other project files.

Each Xcode project has its own **Project Editor** window that displays project source files, targets, and executables.

See Also

Select the Intel® Compiler

To select the Intel® C++ Compiler Classic:

1. Select the target you want to change and click **Build Rules**.
2. Add a new rule by clicking **Editor** > **Add Build Rule** or pressing the **+** button.
3. Under **Process**, choose **C source files** or **C++ source files** , depending on your source files.
4. Under **Using**, select one of the options for the **ICC Intel® C++ Compiler**:

   - ***Major_Version***, such as **2021.1**: The most recently installed compiler, even if it is not the latest release.
   - **Latest Release**: The latest released compiler available on your system. This is useful when you have multiple installations of the Intel compiler and want to use the version most recently released by Intel.
   - ***Major_Version.n.nnn***: A specific package, such as 2021.1.0.000. This is useful when you have multiple packages of one major version installed.

NOTE If the Intel® Compiler does not show up in the drop-down list, it may mean that the compiler does not support your version of Xcode. To enable the Intel® Compiler in Xcode specify the Xcode path during installation and restart the program. The installer checks for the supported Xcode version and warns you in the case of an unsupported version.

NOTE
If you select a tool that does not support the source file type, that source file type is processed by a later rule that specifies that type. For example, even though Objective-C/C++ sources are derived from C sources, they are built by the Intel® C++ Compiler Classic.

Setting Compiler Options

Build the Target

A single project can contain multiple targets. The active target determines how your project is built. This topic describes how to build the target using the Xcode* IDE and documents the build steps using the `xcodebuild` command line utility.

NOTE Starting with the 19.0 release of the Intel® C++ Compiler Classic, macOS 32-bit applications are no longer supported. If you want to compile 32-bit applications, you must use an earlier version of the compiler and you must use Xcode 9.4 or earlier.

Build Using the Xcode IDE

1. Select the target in the project editor under **Targets**.
2. Select **Product** > **Build**.
3. To view the results of your build, click the **Log Navigator** button.

You can change the compilation order of the files in an Xcode target. To re-order the files listed under a target's **Compile Sources**, click a source file and drag it before, or after other compilations.

Build From the Command Line Using the xcodebuild Utility

You can use the `xcodebuild` utility to build a target. This utility uses the Xcode project settings to build target projects from the command line. If you have previously configured your Xcode project to build with the Intel compiler, `xcodebuild` invokes it from the command line.

To build from the command line:

1. Check that the Xcode project is configured to use the Intel® C++ Compiler Classic.
2. Launch a terminal window from the finder by selecting **Applications** > **Utilities** > **Terminal** .
3. Change directories to the directory containing the Xcode project file (`.xcodeproj`).
4. If you have multiple versions of Xcode, use the **xcode-select** utility to verify the current Xcode version.
5. Issue an `xcodebuild` command. For example:

```
xcodebuild -project HelloWorld.xcodeproj -target HelloWorld -configuration Debug
```

6. Run the program built in the example from the previous step by entering the following:

```
./build/Debug/HelloWorld
```

For more information, refer to the `xcodebuild` man page.

Set the Executable's Architecture

Before building a 64-bit executable from within Xcode, you may need to edit the executable's target architecture. To change the **Architectures** setting:

1. Click the target you want to change in the project editor under **Targets** and select the **Build Settings** tab.

2. Under **Architectures**, select the desired architecture.

NOTE The Intel® C++ Compiler Classic generates code solely for Intel® architectures.

Set Compiler Options

To use the Xcode* environment to set compiler options, including options specific to Intel® architecture:

1. Select a target.
2. Under the **Build Settings** tab, click **All**.
3. Scroll down to the list of ICC Intel® C++ Compiler categories.
4. To set an Intel® C++ Compiler Classic option in the Optimization category, scroll down to display **Optimization**.
5. Select a **Setting**, such as **Enable Interprocedural Optimization for Single File Compilation**, and set the option's state. If the **Quick Help** inspector is visible, information about the selected option appears under **Quick Help**.

Tip
Apple* has deprecated the **libstdc++** library, make sure you are using the **libc++** standard library.

The next time you build your project, the selected options are used in the compilation.

NOTE To view the settings that have changed from the established defaults, select the **Levels** button under **Build Settings**.

Run the Executable

Once you have built your Xcode* project, click the **Run** button. The output from the executable is displayed. This button runs the configuration currently associated with the button. Use the **Scheme Editor** to change the configuration associated with the button.

Tip To open the **Scheme Editor**, select **Product** > **Scheme...** > **Edit Scheme...**

Use Dynamic Libraries

Using the Dynamic Libraries does not assume that the Apple* System Integrity Protection feature purges environment variables, such as `DYLD_LIBRARY_PATH`, when launching the protected process. Refer to the https://developer.apple.com/library/archive/documentation/Security/Conceptual/System_Integrity_Protection_Guide/Introduction/Introduction.html for more information. Xcode must take this into account and set the proper environment variables in the Xcode environment.

You can build your Xcode project with the `-shared-intel` compiler option to link with the Intel dynamic libraries. Build your project with the `-qopenmp` or `-parallel` option to link in `libiomp5.dylib`. If you do this, you need to set Xcode build option `Runpath Search path` to an appropriate folder with the compiler and performance libraries, or specify the `DYLD_LIBRARY_PATH` environment variable in the Xcode environment.

To add the environment variable:

1. Open the **Scheme Editor** and select the **Run** action.
2. On the **Arguments** tab, under **Environment Variables**, click the **+** button.
3. Add `DYLD_LIBRARY_PATH`. Set the value to the full path to the Intel compiler's `/lib` directory.

NOTE If you build your project with the `-shared-intel`, `-qopenmp`, or `-parallel` compiler option without setting the `DYLD_LIBRARY_PATH` environment variable, a *library not found* error message results at runtime. Depending on your application, the error message may refer to a library other than the one noted in this example:

```
dyld: Library not loaded: libiomp5.dylib
Referenced
from: /Users/test/hello_world
Reason: image not found
```

Due to the Apple System Integrity Protection you may need to set the `DYLD_LIBRARY_PATH` explicitly in the launch string, or configure the `Runpath Search path` build option.

Use Intel Libraries with Xcode*

You can use the compiler with the following Intel Libraries, which may be included as a part of the product:

- Intel® oneAPI Data Analytics Library (oneDAL)
- Intel® Integrated Performance Primitives (Intel® IPP)
- Intel® oneAPI Threading Building Blocks (oneTBB)
- Intel® oneAPI Math Kernel Library (oneMKL)

To access these libraries in Xcode, select the target and go to **Build Settings** > **Intel® C++ Compiler Performance Library Build Components**.

To use **oneDAL** change the **Use Intel® oneAPI Data Analytics Library** settings as follows:

- **None**: Disables the use of the oneDAL.
- **Use threaded Intel® oneAPI Data Analytics Library**: Links using the threaded version of the library.
- **Use non-threaded Intel® oneAPI Data Analytics Library**: Links using the non-threaded version of the library.

The **Use Intel® oneAPI Threading Building Blocks Library** property enables the library and brings in the associated headers.

The **Use Intel Integrated Performance Primitives Libraries** property provides the following options in a drop-down menu:

- **None**: Disables the use of the Intel® IPP.
- **Use main libraries set**: Uses all the libraries, except the cryptography libraries.
- **Use main libraries and cryptography library**: Uses the cryptography and main libraries.

NOTE The cryptography libraries are subject to export laws.

The **Use Intel® oneAPI Math Kernel Library** property provides the following options in a drop-down menu:

- **None**: Disables the use of oneMKL.
- **Use threaded Intel® oneAPI Math Kernel Library**: Links using the threaded version of the library.
- **Use non-threaded Intel® oneAPI Math Kernel Library**: Links using the non-threaded version of the library.

For more information, see the oneDAL, Intel® Integrated Performance Primitives, oneTBB, and oneMKL documentation.

Part III

Compiler Reference

C/C++ Calling Conventions

There are a number of calling conventions that set the rules on how arguments are passed to a function and how the values are returned from the function.

Calling Conventions on Windows*

The following table summarizes the supported calling conventions on Windows*:

Calling Convention	Compiler Option	Description
__cdecl	`/Gd`	This is the default calling convention for C/C++ programs. It can be specified on a function with variable arguments.
__stdcall	`/Gz`	Standard calling convention used for Win32 API functions.
__fastcall	`/Gr`	Fast calling convention that specifies that arguments are passed in registers rather than on the stack.
__regcall	`/Qregcall` specifies that *__regcall* is the default calling convention for functions in the compilation, unless another calling convention is specified on a declaration.	Intel® C++ Compiler calling convention that specifies that as many arguments as possible are passed in registers; likewise, *__regcall* uses registers whenever possible to return values. This calling convention is ignored if specified on a function with variable arguments. For more information about the Intel-compatible vector functions ABI, see the article *Vector Function Application Binary Interface* at https://software.intel.com/content/www/us/en/develop/download/vector-simd-function-abi.html.

Calling Convention	Compiler Option	Description
		For more information about the GCC vector functions ABI, see the item Libmvec - vector math library document in the GLIBC wiki at sourceware.org.
__thiscall	**none**	Default calling convention used by C++ member functions that do not use variable arguments.
__vectorcall	`/Gv`	Calling convention that specifies that a function passing vector type arguments should utilize vector registers.

Calling Conventions on Linux* and macOS

The following table summarizes the supported calling conventions on Linux* and macOS:

Calling Convention	Compiler Option	Description
__attribute((cdecl))	**none**	Default calling convention for C/C ++ programs. Can be specified on a function with variable arguments.
__attribute((stdcall))	**none**	Calling convention that specifies the arguments are passed on the stack. Cannot be specified on a function with variable arguments.
__attribute((regparm (number)))	**none**	On systems based on IA-32 architecture, the regparm attribute causes the compiler to pass up to *number* arguments in registers `EAX`, `EDX`, and `ECX` instead of on the stack. Functions that take a variable number of arguments will continue to pass all of their arguments on the stack.
__attribute__((regcall))	`-regcall` specifies that *__regcall* is the default calling convention for functions in the compilation, unless another calling convention is specified on a declaration.	Intel® C++ Compiler calling convention that specifies that as many arguments as possible are passed in registers; likewise, *__regcall* uses registers whenever possible to return values. This calling convention is ignored if specified on a function with variable arguments.
__attribute__((vectorcall))	**none**	Calling convention that specifies that a function passing vector type arguments should utilize vector registers.

The __regcall Calling Convention

The *__regcall* calling convention is unique to the Intel® C++ Compiler and requires some additional explanation.

To use *__regcall*, place the keyword before a function declaration. For example:

Example

```
__regcall int foo (int i, int j);

// Linux* and macOS
__attribute__((regcall)) foo (int I, int j);
```

Available __regcall Registers

All registers in a *__regcall* function can be used for parameter passing/returning a value, except those that are reserved by the compiler. The following table lists the registers that are available in each register class depending on the default ABI for the compilation. The registers are used in the order shown in the table.

Register Class/ Architecture	IA-32 for Linux*	IA-32 for Windows*	Intel® 64 for Linux*	Intel® 64 for Windows*
GPR	EAX, ECX, EDX, EDI, ESI	ECX, EDX, EDI, ESI	RAX, RCX, RDX, RDI, RSI, R8, R9, R10, R11, R12, R14, R15	RAX, RCX, RDX, RDI, RSI, R8, R9, R11, R12, R14, R15
FP	ST0	ST0	ST0	ST0
MMX	None	None	None	None
XMM	XMM0 - XMM7	XMM0 - XMM7	XMM0 - XMM15	XMM0 - XMM15
YMM	YMM0 - YMM7	YMM0 - YMM7	YMM0 - YMM15	YMM0 - YMM15
ZMM	ZMM0 - ZMM7	ZMM0 - ZMM7	ZMM0 - YMM15	ZMM0 - YMM15

__regcall Data Type Classification

Parameters and return values for *__regcall* are classified by data type and are passed in the registers of the classes shown in the following table.

NOTE All types assigned to `XMM`, `YMM`, or `ZMM` in a non-SSE target are passed in the stack.

Type (for both unsigned and signed types)	IA-32	Intel® 64
bool, char, int, enum, _Decimal32, long, pointer	GPR	GPR
short, __mmask{8,16,32,64}	GPR	GPR
long long, __int64	See Structured Data Type Classification Rules	GPR
_Decimal64	XMM	GPR

Type (for both unsigned and signed types)	IA-32	Intel® 64
long double	`FP`	`FP`
float, double, float128, _Decimal128	`XMM`	`XMM`
__m128, __m128i, __m128d	`XMM`	`XMM`
__m256, __m256i, __m256d	`YMM`	`YMM`
__m512, __m512i, __m512d	`ZMM`	`ZMM`
complex type, struct, union	See Structured Data Type Classification Rules	See Structured Data Type Classification Rules

NOTE For the purpose of structured types, the classification of `GPR` class is used.

NOTE On systems based on IA-32 architecture, these 64-bit integer types (long long, __int64) get classified to the `GPR` class and are passed in two registers, as if they were implemented as a structure of two 32-bit integer fields.

Types that are smaller in size than registers than registers of their associated class are passed in the lower part of those registers; for example, float is passed in the lower four bytes of an `XMM` register.

__regcall Structured Data Type Classification Rules

Structures/unions and complex types are classified similarly to what is described in the x86_64 ABI, with the following exceptions:

- There is no limitation on the overall size of a structure.
- The register classes for basic types are given in Data Type Classifications.
- For systems based on the IA-32 architecture, classification is performed on four-bytes. For systems based on other architectures, classification is performed on eight-bytes.

__regcall Placement in Registers or on the Stack

After the classification described in Data Type Classifications and Structured Data Type Classification Rules, *__regcall* parameters and return values are either put into registers specified in Available Registers or placed in memory, according to the following:

- Each chunk (eight bytes on systems based on Intel® 64 architecture or four-bytes on systems based on IA-32 architecture) of a value of Data Type is assigned a register class. If enough registers from Available Registers are available, the whole value is passed in registers, otherwise the value is passed using the stack.
- If the classification were to use one or more register classes, then the registers of these classes from the table in Available Registers are used, in the order given there.
- If no more registers are available in one of the required register classes, then the whole value is put on the stack.

__regcall Registers that Preserve Their Values

The following registers preserve their values across a *__regcall* call, as long as they were not used for passing a parameter or returning a value:

Register Class/ABI	IA-32	Intel® 64 for Linux*	Intel® 64 for Windows*
GPR	ESI, EDI, EBX, EBP, ESP	R12 - R15, RBX, RBP, RSP	R12 - R15, RBX, RBP, RSP
FP	None	None	None
MMX	None	None	None
XMM	XMM4 - XMM7	XMM8 - XMM15	XMM8 - XMM15
YMM	XMM4 - XMM7	XMM8 - XMM15	XMM8 - XMM15
ZMM	XMM4 - XMM7	XMM8 - XMM15	XMM8 - XMM15

All other registers do not preserve their values across this call.

Compiler Options

This compiler supports many compiler options you can use in your applications.

In this section, we provide the following:

- An alphabetical list of compiler options that includes their short descriptions
- Lists of deprecated and removed options
- General rules for compiler options and the conventions we use when referring to options
- Details about what appears in the compiler option descriptions
- A description of each compiler option. The descriptions appear under the option's functional category. Within each category, the options are listed in alphabetical order.

For details about new functionality, such as new compiler options, see the Release Notes for the product.

Alphabetical Option List

The following table lists all the current compiler options in alphabetical order.

A, QA	Specifies an identifier for an assertion.
alias-const, Qalias-const	Determines whether the compiler assumes a parameter of type pointer-to-const does not alias with a parameter of type pointer-to-non-const.
align	Determines whether variables and arrays are naturally aligned.
ansi	Enables language compatibility with the gcc option ansi.
ansi-alias, Qansi-alias	Enables or disables the use of ANSI aliasing rules in optimizations.
ansi-alias-check, Qansi-alias-check	Enables or disables the ansi-alias checker.

arch	Tells the compiler which features it may target, including which instruction sets it may generate.
auto-ilp32, Qauto-ilp32	Instructs the compiler to analyze the program to determine if there are 64-bit pointers that can be safely shrunk into 32-bit pointers and if there are 64-bit longs (on Linux* systems) that can be safely shrunk into 32-bit longs.
auto-p32	Instructs the compiler to analyze the program to determine if there are 64-bit pointers that can be safely shrunk to 32-bit pointers.
ax, Qax	Tells the compiler to generate multiple, feature-specific auto-dispatch code paths for Intel® processors if there is a performance benefit.
B	Specifies a directory that can be used to find include files, libraries, and executables.
Bdynamic	Enables dynamic linking of libraries at run time.
bigobj	Increases the number of sections that an object file can contain.
Bstatic	Enables static linking of a user's library.
Bsymbolic	Binds references to all global symbols in a program to the definitions within a user's shared library.
Bsymbolic-functions	Binds references to all global function symbols in a program to the definitions within a user's shared library.
C	Places comments in preprocessed source output.
c	Prevents linking.
check	Checks for certain conditions at run time.
check-pointers, Qcheck-pointers	Determines whether the compiler checks bounds for memory access through pointers.
check-pointers-dangling, Qcheck-pointers-dangling	Determines whether the compiler checks for dangling pointer references.
check-pointers-mpx, Qcheck-pointers-mpx	Determines whether the compiler checks bounds for memory access through pointers on processors that support Intel® Memory Protection Extensions (Intel® MPX).
check-pointers-narrowing, Qcheck-pointers-narrowing	Determines whether the compiler enables or disables the narrowing of pointers to structure fields.
check-pointers-undimensioned, Qcheck-pointers-undimensioned	Determines whether the compiler checks bounds for memory access through arrays that are declared without dimensions.
clang-name	Specifies the name of the Clang compiler that should be used to set up the environment for C compilations.
clangxx-name	Specifies the name of the Clang++ compiler that should be used to set up the environment for C++ compilations.
complex-limited-range, Qcomplex-limited-range	Determines whether the use of basic algebraic expansions of some arithmetic operations involving data of type COMPLEX is enabled.
cxxlib	Determines whether the compiler links using the C++ run-time libraries and header files provided by gcc.
D	Defines a macro name that can be associated with an optional value.

dD, QdD	Same as option -dM, but outputs #define directives in preprocessed source.
debug (Linux* and macOS*)	Enables or disables generation of debugging information.
debug (Windows*)	Enables or disables generation of debugging information.
device-math-lib	Enables or disables certain device libraries. This is a deprecated option that may be removed in a future release.
diag, Qdiag	Controls the display of diagnostic information during compilation.
diag-dump, Qdiag-dump	Tells the compiler to print all enabled diagnostic messages.
diag-enable=power, Qdiag-enable:power	Controls whether diagnostics are enabled for possibly inefficient code that may affect power consumption on IA-32 and Intel® 64 architectures.
diag-error-limit, Qdiag-error-limit	Specifies the maximum number of errors allowed before compilation stops.
diag-file, Qdiag-file	Causes the results of diagnostic analysis to be output to a file.
diag-file-append, Qdiag-file-append	Causes the results of diagnostic analysis to be appended to a file.
diag-id-numbers, Qdiag-id-numbers	Determines whether the compiler displays diagnostic messages by using their ID number values.
diag-once, Qdiag-once	Tells the compiler to issue one or more diagnostic messages only once.
dM, QdM	Tells the compiler to output macro definitions in effect after preprocessing.
dN, QdN	Same as option -dD, but output #define directives contain only macro names.
dryrun	Specifies that driver tool commands should be shown but not executed.
dumpmachine	Displays the target machine and operating system configuration.
dumpversion	Displays the version number of the compiler.
dynamiclib	Invokes the libtool command to generate dynamic libraries.
dynamic-linker	Specifies a dynamic linker other than the default.
E	Causes the preprocessor to send output to stdout.
early-template-check	Lets you semantically check template function template prototypes before instantiation.
EH	Specifies the model of exception handling to be performed.
EP	Causes the preprocessor to send output to stdout, omitting #line directives.
F (macOS*)	Adds a framework directory to the head of an include file search path.
F (Windows*)	Specifies the stack reserve amount for the program.
Fa	Specifies that an assembly listing file should be generated.
FA	Specifies the contents of an assembly listing file.
fabi-version	Instructs the compiler to select a specific ABI implementation.

falias, Oa	Determines whether aliasing is assumed in a program.
falign-functions, Qfnalign	Tells the compiler to align functions on an optimal byte boundary.
falign-loops, Qalign-loops	Aligns loops to a power-of-two byte boundary.
falign-stack	Tells the compiler the stack alignment to use on entry to routines. This is a deprecated option that may be removed in a future release.
fargument-alias, Qalias-args	Determines whether function arguments can alias each other.
fargument-noalias-global	Tells the compiler that function arguments cannot alias each other and cannot alias global storage.
fasm-blocks	Enables the use of blocks and entire functions of assembly code within a C or C++ file.
fast	Maximizes speed across the entire program.
fast-transcendentals, Qfast-transcendentals	Enables the compiler to replace calls to transcendental functions with faster but less precise implementations.
fasynchronous-unwind-tables	Determines whether unwind information is precise at an instruction boundary or at a call boundary.
fblocks	Determines whether Apple* blocks are enabled or disabled.
fbuiltin, Oi	Enables or disables inline expansion of intrinsic functions.
FC	Displays the full path of source files passed to the compiler in diagnostics.
fcf-protection, Qcf-protection	Enables Control-flow Enforcement Technology (CET) protection, which defends your program from certain attacks that exploit vulnerabilities. This option offers preliminary support for CET.
fcode-asm	Produces an assembly listing with machine code annotations.
fcommon	Determines whether the compiler treats common symbols as global definitions.
FD	Generates file dependencies related to the Microsoft* C/C++ compiler.
Fd	Lets you specify a name for a program database (PDB) file created by the compiler.
fdata-sections, Gw	Places each data item in its own COMDAT section.
fdefer-pop	Determines whether the compiler always pops the arguments to each function call as soon as that function returns.
Fe	Specifies the name for a built program or dynamic-link library.
feliminate-unused-debug-types, Qeliminate-unused-debug-types	Controls the debug information emitted for types declared in a compilation unit.
femit-class-debug-always	Controls the format and size of debug information generated by the compiler for C++ classes.
fexceptions	Enables exception handling table generation.
fextend-arguments, Qextend-arguments	Controls how scalar integer arguments are extended in calls to unprototyped and varargs functions.

ffat-lto-objects	Determines whether a fat link-time optimization (LTO) object, containing both intermediate language and object code, is generated during an interprocedural optimization compilation (-c –ipo).
ffnalias, Ow	Determines whether aliasing is assumed within functions.
ffreestanding , Qfreestanding	Ensures that compilation takes place in a freestanding environment.
ffriend-injection	Causes the compiler to inject friend functions into the enclosing namespace.
ffunction-sections, Gy	Places each function in its own COMDAT section.
fgnu89-inline	Tells the compiler to use C89 semantics for inline functions when in C99 mode.
fimf-absolute-error, Qimf-absolute-error	Defines the maximum allowable absolute error for math library function results.
fimf-accuracy-bits, Qimf-accuracy-bits	Defines the relative error for math library function results, including division and square root.
fimf-arch-consistency, Qimf-arch-consistency	Ensures that the math library functions produce consistent results across different microarchitectural implementations of the same architecture.
fimf-domain-exclusion, Qimf-domain-exclusion	Indicates the input arguments domain on which math functions must provide correct results.
fimf-force-dynamic-target, Qimf-force-dynamic-target	Instructs the compiler to use run-time dispatch in calls to math functions.
fimf-max-error, Qimf-max-error	Defines the maximum allowable relative error for math library function results, including division and square root.
fimf-precision, Qimf-precision	Lets you specify a level of accuracy (precision) that the compiler should use when determining which math library functions to use.
fimf-use-svml, Qimf-use-svml	Instructs the compiler to use the Short Vector Math Library (SVML) rather than the Intel® C++ Compiler Classic Math Library (LIBM) to implement math library functions.
finline	Tells the compiler to inline functions declared with __inline and perform C ++ inlining .
finline-functions	Enables function inlining for single file compilation.
finline-limit	Lets you specify the maximum size of a function to be inlined.
finstrument-functions, Qinstrument-functions	Determines whether function entry and exit points are instrumented.
FI	Tells the preprocessor to include a specified file name as the header file.
fixed	Causes the linker to create a program that can be loaded only at its preferred base address.
fjump-tables	Determines whether jump tables are generated for switch statements.
fkeep-static-consts , Qkeep-static-consts	Tells the compiler to preserve allocation of variables that are not referenced in the source.
Fm	Tells the linker to generate a link map file. This is a deprecated option that may be removed in a future release.

fma, Qfma	Determines whether the compiler generates fused multiply-add (FMA) instructions if such instructions exist on the target processor.
fmath-errno	Tells the compiler that errno can be reliably tested after calls to standard math library functions.
fmerge-constants	Determines whether the compiler and linker attempt to merge identical constants (string constants and floating-point constants) across compilation units.
fmerge-debug-strings	Causes the compiler to pool strings used in debugging information.
fminshared	Specifies that a compilation unit is a component of a main program and should not be linked as part of a shareable object.
fmpc-privatize	Enables or disables privatization of all static data for the MultiProcessor Computing environment (MPC) unified parallel runtime.
fms-dialect	Enables support for a language dialect that is compatible with Microsoft Windows*, while maintaining link compatibility with GCC*.
fmudflap	Tells the compiler to instrument risky pointer operations to prevent buffer overflows and invalid heap use. This is a deprecated option that may be removed in a future release.
fno-gnu-keywords	Tells the compiler to not recognize typeof as a keyword.
fno-implicit-inline-templates	Tells the compiler to not emit code for implicit instantiations of inline templates.
fno-implicit-templates	Tells the compiler to not emit code for non-inline templates that are instantiated implicitly.
fnon-call-exceptions	Allows trapping instructions to throw C++ exceptions.
fnon-lvalue-assign	Determines whether casts and conditional expressions can be used as lvalues.
fno-operator-names	Disables support for the operator names specified in the standard.
fno-rtti	Disables support for run-time type information (RTTI).
fnsplit, Qfnsplit	Enables function splitting.
Fo	Specifies the name for an object file.
fomit-frame-pointer , Oy	Determines whether EBP is used as a general-purpose register in optimizations.
fopenmp-device-lib	Enables or disables certain device libraries for an OpenMP* target.
foptimize-sibling-calls	Determines whether the compiler optimizes tail recursive calls.
Fp	Lets you specify an alternate path or file name for precompiled header files.
fpack-struct	Specifies that structure members should be packed together.
fpascal-strings	Tells the compiler to allow for Pascal-style string literals.
fpermissive	Tells the compiler to allow for non-conformant code.
fpic	Determines whether the compiler generates position-independent code.
fpie	Tells the compiler to generate position-independent code. The generated code can only be linked into executables.

fp-model, fp	Controls the semantics of floating-point calculations.
fp-port, Qfp-port	Rounds floating-point results after floating-point operations.
fprotect-parens, Qprotect-parens	Determines whether the optimizer honors parentheses when floating-point expressions are evaluated.
fp-speculation, Qfp-speculation	Tells the compiler the mode in which to speculate on floating-point operations.
fp-stack-check, Qfp-stack-check	Tells the compiler to generate extra code after every function call to ensure that the floating-point stack is in the expected state.
fp-trap, Qfp-trap	Sets the floating-point trapping mode for the main routine.
fp-trap-all, Qfp-trap-all	Sets the floating-point trapping mode for all routines.
FR	Invokes the Microsoft* C/C++ compiler and tells it to produce a BSCMAKE .sbr file with complete symbolic information.
freg-struct-return	Tells the compiler to return struct and union values in registers when possible.
fshort-enums	Tells the compiler to allocate as many bytes as needed for enumerated types.
fsource-asm	Produces an assembly listing with source code annotations.
fstack-protector	Enables or disables stack overflow security checks for certain (or all) routines.
fstack-security-check	Determines whether the compiler generates code that detects some buffer overruns.
fsyntax-only	Tells the compiler to check only for correct syntax.
ftemplate-depth, Qtemplate-depth	Control the depth in which recursive templates are expanded.
ftls-model	Changes the thread local storage (TLS) model.
ftrapuv , Qtrapuv	Initializes stack local variables to an unusual value to aid error detection.
ftz, Qftz	Flushes denormal results to zero.
funroll-all-loops	Unroll all loops even if the number of iterations is uncertain when the loop is entered.
funsigned-bitfields	Determines whether the default bitfield type is changed to unsigned.
funsigned-char	Change default char type to unsigned.
fuse-ld	Tells the compiler to use a different linker instead of the default linker (ld).
fverbose-asm	Produces an assembly listing with compiler comments, including options and version information.
fvisibility	Specifies the default visibility for global symbols or the visibility for symbols in a file.
fvisibility-inlines-hidden	Causes inline member functions (those defined in the class declaration) to be marked hidden.
fzero-initialized-in-bss, Qzero-initialized-in-bss	Determines whether the compiler places in the DATA section any variables explicitly initialized with zeros.

g	Tells the compiler to generate a level of debugging information in the object file.
GA	Enables faster access to certain thread-local storage (TLS) variables.
gcc, gcc-sys	Determines whether certain GNU macros are defined or undefined.
gcc-include-dir	Controls whether the gcc-specific include directory is put into the system include path.
gcc-name	Lets you specify the name of the GCC compiler that should be used to set up the environment for C compilations.
Gd	Makes __cdecl the default calling convention.
gdwarf	Lets you specify a DWARF Version format when generating debug information.
Ge	Enables stack-checking for all functions. This is a deprecated option that may be removed in a future release.
GF	Enables read-only string-pooling optimization.
Gh	Calls a function to aid custom user profiling.
GH	Calls a function to aid custom user profiling.
global-hoist, Qglobal-hoist	Enables certain optimizations that can move memory loads to a point earlier in the program execution than where they appear in the source.
Gm	Enables a minimal rebuild.
gnu-prefix	Lets you specify a prefix that will be added to the names of gnu utilities called from the compiler.
GR	Enables or disables C++ Run Time Type Information (RTTI).
Gr	Makes __fastcall the default calling convention.
grecord-gcc-switches	Causes the command line options that were used to invoke the compiler to be appended to the DW_AT_producer attribute in DWARF debugging information.
GS	Determines whether the compiler generates code that detects some buffer overruns.
Gs	Lets you control the threshold at which the stack checking routine is called or not called.
gsplit-dwarf	Creates a separate object file containing DWARF debug information.
GT	Enables fiber-safe thread-local storage of data.
guard	Enables the control flow protection mechanism.
guide, Qguide	Lets you set a level of guidance for auto-vectorization, auto parallelism, and data transformation.
guide-data-trans, Qguide-data-trans	Lets you set a level of guidance for data transformation.
guide-file, Qguide-file	Causes the results of guided auto parallelism to be output to a file.
guide-file-append, Qguide-file-append	Causes the results of guided auto parallelism to be appended to a file.

guide-opts, Qguide-opts	Tells the compiler to analyze certain code and generate recommendations that may improve optimizations.
guide-par, Qguide-par	Lets you set a level of guidance for auto parallelism.
guide-vec, Qguide-vec	Lets you set a level of guidance for auto-vectorization.
Gv	Tells the compiler to use the vector calling convention (__vectorcall) when passing vector type arguments.
gxx-name	Lets you specify the name of the g++ compiler that should be used to set up the environment for C++ compilations.
GZ	Initializes all local variables. This is a deprecated option that may be removed in a future release.
Gz	Makes __stdcall the default calling convention.
H, QH	Tells the compiler to display the include file order and continue compilation.
H (Windows*)	Causes the compiler to limit the length of external symbol names. This is a deprecated option. There is no replacement option.
help	Displays all supported compiler options or supported compiler options within a specified category of options.
help-pragma, Qhelp-pragma	Displays all supported pragmas.
homeparams	Tells the compiler to store parameters passed in registers to the stack.
hotpatch	Tells the compiler to prepare a routine for hotpatching.
I	Specifies an additional directory to search for include files.
I-	Splits the include path.
icc, Qicl	Determines whether certain Intel®-specific compiler macros are defined or undefined.
idirafter	Adds a directory to the second include file search path.
imacros	Allows a header to be specified that is included in front of the other headers in the translation unit.
inline-calloc, Qinline-calloc	Tells the compiler to inline calls to calloc() as calls to malloc() and memset().
inline-factor, Qinline-factor	Specifies the percentage multiplier that should be applied to all inlining options that define upper limits.
inline-forceinline, Qinline-forceinline	Instructs the compiler to force inlining of functions suggested for inlining whenever the compiler is capable doing so.
inline-level, Ob	Specifies the level of inline function expansion.
inline-max-per-compile, Qinline-max-per-compile	Specifies the maximum number of times inlining may be applied to an entire compilation unit.
inline-max-per-routine, Qinline-max-per-routine	Specifies the maximum number of times the inliner may inline into a particular routine.
inline-max-size, Qinline-max-size	Specifies the lower limit for the size of what the inliner considers to be a large routine.

inline-max-total-size, Qinline-max-total-size	Specifies how much larger a routine can normally grow when inline expansion is performed.
inline-min-caller-growth, Qinline-min-caller-growth	Lets you specify a function size n for which functions of size <= n do not contribute to the estimated growth of the caller when inlined.
inline-min-size, Qinline-min-size	Specifies the upper limit for the size of what the inliner considers to be a small routine.
intel-extensions, Qintel-extensions	Enables or disables all Intel® C and Intel® C++ language extensions.
intel-freestanding	Lets you compile in the absence of a gcc environment.
intel-freestanding-target-os	Lets you specify the target operating system for compilation.
ip, Qip	Determines whether additional interprocedural optimizations for single-file compilation are enabled.
ip-no-inlining, Qip-no-inlining	Disables full and partial inlining enabled by interprocedural optimization options.
ip-no-pinlining, Qip-no-pinlining	Disables partial inlining enabled by interprocedural optimization options.
ipo, Qipo	Enables interprocedural optimization between files.
ipo-c, Qipo-c	Tells the compiler to optimize across multiple files and generate a single object file.
ipo-jobs, Qipo-jobs	Specifies the number of commands (jobs) to be executed simultaneously during the link phase of Interprocedural Optimization (IPO).
ipo-S, Qipo-S	Tells the compiler to optimize across multiple files and generate a single assembly file.
ipo-separate, Qipo-separate	Tells the compiler to generate one object file for every source file.
ipp-link, Qipp-link	Controls whether the compiler links to static or dynamic threaded Intel® Integrated Performance Primitives (Intel® IPP) run-time libraries.
iprefix	Lets you indicate the prefix for referencing directories that contain header files.
iquote	Adds a directory to the front of the include file search path for files included with quotes but not brackets.
isystem	Specifies a directory to add to the start of the system include path.
iwithprefix	Appends a directory to the prefix passed in by -iprefix and puts it on the include search path at the end of the include directories.
iwithprefixbefore	Similar to -iwithprefix except the include directory is placed in the same place as -I command-line include directories.
J	Sets the default character type to unsigned.
Kc++, TP	Tells the compiler to process all source or unrecognized file types as C++ source files. This is a deprecated option that may be removed in a future release.
l	Tells the linker to search for a specified library when linking.
L	Tells the linker to search for libraries in a specified directory before searching the standard directories.

LD	Specifies that a program should be linked as a dynamic-link (DLL) library.
link	Passes user-specified options directly to the linker at compile time.
m	Tells the compiler which features it may target, including which instruction sets it may generate.
M, QM	Tells the compiler to generate makefile dependency lines for each source file.
m32, m64 , Qm32, Qm64	Tells the compiler to generate code for a specific architecture.
m80387	Specifies whether the compiler can use x87 instructions.
malign-double	Determines whether double, long double, and long long types are naturally aligned. This option is equivalent to specifying option align.
malign-mac68k	Aligns structure fields on 2-byte boundaries (m68k compatible).
malign-natural	Aligns larger types on natural size-based boundaries (overrides ABI).
malign-power	Aligns based on ABI-specified alignment rules.
map-opts, Qmap-opts	Maps one or more compiler options to their equivalent on a different operating system.
march	Tells the compiler to generate code for processors that support certain features.
masm	Tells the compiler to generate the assembler output file using a selected dialect.
mauto-arch, Qauto-arch	Tells the compiler to generate multiple, feature-specific auto-dispatch code paths for x86 architecture processors if there is a performance benefit.
mbranches-within-32B-boundaries, Qbranches-within-32B-boundaries	Tells the compiler to align branches and fused branches on 32-byte boundaries for better performance.
mcmodel	Tells the compiler to use a specific memory model to generate code and store data.
mconditional-branch, Qconditional-branch	Lets you identify and fix code that may be vulnerable to speculative execution side-channel attacks, which can leak your secure data as a result of bad speculation of a conditional branch direction.
MD	Tells the linker to search for unresolved references in a multithreaded, dynamic-link run-time library.
MD, QMD	Preprocess and compile, generating output file containing dependency information ending with extension .d.
mdynamic-no-pic	Generates code that is not position-independent but has position-independent external references.
MF, QMF	Tells the compiler to generate makefile dependency information in a file.
MG, QMG	Tells the compiler to generate makefile dependency lines for each source file.
minstruction, Qinstruction	Determines whether MOVBE instructions are generated for certain Intel® processors.
mlong-double	Lets you override the default configuration of the long double data type.

MM, QMM	Tells the compiler to generate makefile dependency lines for each source file.
MMD, QMMD	Tells the compiler to generate an output file containing dependency information.
momit-leaf-frame-pointer	Determines whether the frame pointer is omitted or kept in leaf functions.
MP	Tells the compiler to add a phony target for each dependency.
mp1, Qprec	Improves floating-point precision and consistency.
MP-force	Disables the default heuristics used when compiler option /MP is specified. This lets you control the number of processes spawned.
MQ	Changes the default target rule for dependency generation.
mregparm	Lets you control the number registers used to pass integer arguments.
mregparm-version	Determines which version of the Application Binary Interface (ABI) is used for the regparm parameter passing convention.
mstringop-inline-threshold, Qstringop-inline-threshold	Tells the compiler to not inline calls to buffer manipulation functions such as memcpy and memset when the number of bytes the functions handle are known at compile time and greater than the specified value.
mstringop-strategy, Qstringop-strategy	Lets you override the internal decision heuristic for the particular algorithm used when implementing buffer manipulation functions such as memcpy and memset.
MT	Tells the linker to search for unresolved references in a multithreaded, static run-time library.
MT, QMT	Changes the default target rule for dependency generation.
mtune, tune	Performs optimizations for specific processors but does not cause extended instruction sets to be used (unlike -march).
multibyte-chars, Qmultibyte-chars	Determines whether multi-byte characters are supported.
multiple-processes , MP	Creates multiple processes that can be used to compile large numbers of source files at the same time.
noBool	Disables the bool keyword.
no-bss-init, Qnobss-init	Tells the compiler to place in the DATA section any uninitialized variables and explicitly zero-initialized variables. This is a deprecated option that may be removed in a future release.
nodefaultlibs	Prevents the compiler from using standard libraries when linking.
no-intel-lib, Qno-intel-lib	Disables linking to specified Intel® libraries, or to all Intel® libraries.
no-libgcc	Prevents the linking of certain gcc-specific libraries.
nolib-inline	Disables inline expansion of standard library or intrinsic functions.
nologo	Tells the compiler to not display compiler version information.
nostartfiles	Prevents the compiler from using standard startup files when linking.
nostdinc++	Do not search for header files in the standard directories for C++, but search the other standard directories.

nostdlib	Prevents the compiler from using standard libraries and startup files when linking.
O	Specifies the code optimization for applications.
o	Specifies the name for an output file.
Od	Disables all optimizations.
Ofast	Sets certain aggressive options to improve the speed of your application.
Os	Enables optimizations that do not increase code size; it produces smaller code size than O2.
Ot	Enables all speed optimizations.
Ox	Enables maximum optimizations.
p	Compiles and links for function profiling with gprof(1).
P	Tells the compiler to stop the compilation process and write the results to a file.
par-affinity, Qpar-affinity	Specifies thread affinity.
parallel, Qparallel	Tells the auto-parallelizer to generate multithreaded code for loops that can be safely executed in parallel.
parallel-source-info, Qparallel-source-info	Enables or disables source location emission when OpenMP* or auto-parallelism code is generated.
par-loops, Qpar-loops	Lets you select between old or new implementations of parallel loop support.
par-num-threads, Qpar-num-threads	Specifies the number of threads to use in a parallel region.
par-runtime-control, Qpar-runtime-control	Generates code to perform run-time checks for loops that have symbolic loop bounds.
par-schedule, Qpar-schedule	Lets you specify a scheduling algorithm for loop iterations.
par-threshold, Qpar-threshold	Sets a threshold for the auto-parallelization of loops.
pc, Qpc	Enables control of floating-point significand precision.
pch	Tells the compiler to use appropriate precompiled header files.
pch-create	Tells the compiler to create a precompiled header file.
pch-dir	Tells the compiler the location for precompiled header files.
pch-use	Tells the compiler to use a precompiled header file.
pdbfile	Lets you specify the name for a program database (PDB) file created by the linker.
pie	Determines whether the compiler generates position-independent code that will be linked into an executable.
pragma-optimization-level	Specifies which interpretation of the optimization_level pragma should be used if no prefix is specified.
prec-div, Qprec-div	Improves precision of floating-point divides.
prec-sqrt, Qprec-sqrt	Improves precision of square root implementations.

print-multi-lib	Prints information about where system libraries should be found.
print-sysroot	Prints the target sysroot directory that is used during compilation.
prof-data-order, Qprof-data-order	Enables or disables data ordering if profiling information is enabled.
prof-dir, Qprof-dir	Specifies a directory for profiling information output files.
prof-file, Qprof-file	Specifies an alternate file name for the profiling summary files.
prof-func-groups	Enables or disables function grouping if profiling information is enabled.
prof-func-order, Qprof-func-order	Enables or disables function ordering if profiling information is enabled.
prof-gen, Qprof-gen	Produces an instrumented object file that can be used in profile guided optimization.
prof-gen-sampling	Tells the compiler to generate debug discriminators in debug output. This aids in developing more precise sampled profiling output. This is a deprecated option that may be removed in a future release.
prof-hotness-threshold, Qprof-hotness-threshold	Lets you set the hotness threshold for function grouping and function ordering.
prof-src-dir, Qprof-src-dir	Determines whether directory information of the source file under compilation is considered when looking up profile data records.
prof-src-root, Qprof-src-root	Lets you use relative directory paths when looking up profile data and specifies a directory as the base.
prof-src-root-cwd, Qprof-src-root-cwd	Lets you use relative directory paths when looking up profile data and specifies the current working directory as the base.
prof-use, Qprof-use	Enables the use of profiling information during optimization.
prof-use-sampling	Lets you use data files produced by hardware profiling to produce an optimized executable. This is a deprecated option that may be removed in a future release.
prof-value-profiling, Qprof-value-profiling	Controls which values are value profiled.
pthread	Tells the compiler to use pthreads library for multithreading support.
Qcov-dir	Specifies a directory for profiling information output files that can be used with the codecov or tselect tool.
Qcov-file	Specifies an alternate file name for the profiling summary files that can be used with the codecov or tselect tool.
Qcov-gen	Produces an instrumented object file that can be used with the codecov or tselect tool.
Qcxx-features	Enables standard C++ features without disabling Microsoft* features.
qdaal, Qdaal	Tells the compiler to link to certain libraries in the Intel® oneAPI Data Analytics Library (oneDAL).
Qgcc-dialect	Enables support for a limited gcc-compatible dialect on Windows*.
Qinline-dllimport	Determines whether dllimport functions are inlined.

Qinstall	Specifies the root directory where the compiler installation was performed.
qipp, Qipp	Tells the compiler to link to some or all of the Intel® Integrated Performance Primitives (Intel® IPP) libraries.
Qlocation	Specifies the directory for supporting tools.
Qlong-double	Changes the default size of the long double data type.
qmkl, Qmkl	Tells the compiler to link to certain libraries in the Intel® oneAPI Math Kernel Library (oneMKL). On Windows systems, you must specify this option at compile time.
Qms	Tells the compiler to emulate Microsoft* compatibility bugs.
qopenmp, Qopenmp	Enables the parallelizer to generate multi-threaded code based on OpenMP* directives.
qopenmp-lib, Qopenmp-lib	Lets you specify an OpenMP* run-time library to use for linking.
qopenmp-link	Controls whether the compiler links to static or dynamic OpenMP* run-time libraries.
qopenmp-simd, Qopenmp-simd	Enables or disables OpenMP* SIMD compilation.
qopenmp-stubs, Qopenmp-stubs	Enables compilation of OpenMP* programs in sequential mode.
qopenmp-threadprivate, Qopenmp-threadprivate	Lets you specify an OpenMP* threadprivate implementation.
qopt-args-in-regs, Qopt-args-in-regs	Determines whether calls to routines are optimized by passing parameters in registers instead of on the stack. This option is deprecated and will be removed in a future release.
qopt-assume-safe-padding, Qopt-assume-safe-padding	Determines whether the compiler assumes that variables and dynamically allocated memory are padded past the end of the object.
qopt-block-factor, Qopt-block-factor	Lets you specify a loop blocking factor.
qopt-calloc	Tells the compiler to substitute a call to _intel_fast_calloc() for a call to calloc().
qopt-class-analysis, Qopt-class-analysis	Determines whether C++ class hierarchy information is used to analyze and resolve C++ virtual function calls at compile time.
qopt-dynamic-align, Qopt-dynamic-align	Enables or disables dynamic data alignment optimizations.
Qoption	Passes options to a specified tool.
qopt-jump-tables, Qopt-jump-tables	Enables or disables generation of jump tables for switch statements.
qopt-malloc-options	Lets you specify an alternate algorithm for malloc().
qopt-matmul, Qopt-matmul	Enables or disables a compiler-generated Matrix Multiply (matmul) library call.
qopt-mem-layout-trans, Qopt-mem-layout-trans	Controls the level of memory layout transformations performed by the compiler.

qopt-multiple-gather-scatter-by-shuffles, Qopt-multiple-gather-scatter-by-shuffles	Enables or disables the optimization for multiple adjacent gather/scatter type vector memory references.
qopt-multi-version-aggressive, Qopt-multi-version-aggressive	Tells the compiler to use aggressive multi-versioning to check for pointer aliasing and scalar replacement.
qopt-prefetch, Qopt-prefetch	Enables or disables prefetch insertion optimization.
qopt-prefetch-distance, Qopt-prefetch-distance	Specifies the prefetch distance to be used for compiler-generated prefetches inside loops.
qopt-prefetch-issue-excl-hint, Qopt-prefetch-issue-excl-hint	Supports the prefetchW instruction in Intel® microarchitecture code name Broadwell and later.
qopt-ra-region-strategy, Qopt-ra-region-strategy	Selects the method that the register allocator uses to partition each routine into regions.
qopt-report, Qopt-report	Tells the compiler to generate an optimization report.
qopt-report-annotate, Qopt-report-annotate	Enables the annotated source listing feature and specifies its format.
qopt-report-annotate-position, Qopt-report-annotate-position	Enables the annotated source listing feature and specifies the site where optimization messages appear in the annotated source in inlined cases of loop optimizations.
qopt-report-embed, Qopt-report-embed	Determines whether special loop information annotations will be embedded in the object file and/or the assembly file when it is generated.
qopt-report-file, Qopt-report-file	Specifies that the output for the optimization report goes to a file, stderr, or stdout.
qopt-report-filter, Qopt-report-filter	Tells the compiler to find the indicated parts of your application, and generate optimization reports for those parts of your application.
qopt-report-format, Qopt-report-format	Specifies the format for an optimization report.
qopt-report-help, Qopt-report-help	Displays the optimizer phases available for report generation and a short description of what is reported at each level.
qopt-report-names, Qopt-report-names	Specifies whether mangled or unmangled names should appear in the optimization report.
qopt-report-per-object, Qopt-report-per-object	Tells the compiler that optimization report information should be generated in a separate file for each object.
qopt-report-phase, Qopt-report-phase	Specifies one or more optimizer phases for which optimization reports are generated.
qopt-report-routine, Qopt-report-routine	Tells the compiler to generate an optimization report for each of the routines whose names contain the specified substring.
qopt-streaming-stores, Qopt-streaming-stores	Enables generation of streaming stores for optimization.
qopt-subscript-in-range, Qopt-subscript-in-range	Determines whether the compiler assumes that there are no "large" integers being used or being computed inside loops.
qopt-zmm-usage, Qopt-zmm-usage	Defines a level of zmm registers usage.

qoverride-limits, Qoverride-limits	Lets you override certain internal compiler limits that are intended to prevent excessive memory usage or compile times for very large, complex compilation units.
Qpar-adjust-stack	Tells the compiler to generate code to adjust the stack size for a fiber-based main thread.
Qpatchable-addresses	Tells the compiler to generate code such that references to statically assigned addresses can be patched.
Qpchi	Enable precompiled header coexistence to reduce build time.
Qsafeseh	Registers exception handlers for safe exception handling.
Qsfalign	Specifies stack alignment for functions. This is a deprecated option that may be removed in a future release..
qsimd-honor-fp-model, Qsimd-honor-fp-model	Tells the compiler to obey the selected floating-point model when vectorizing SIMD loops.
qsimd-serialize-fp-reduction, Qsimd-serialize-fp-reduction	Tells the compiler to serialize floating-point reduction when vectorizing SIMD loops.
qtbb, Qtbb	Tells the compiler to link to the Intel® oneAPI Threading Building Blocks (oneTBB) libraries.
Quse-msasm-symbols	Tells the compiler to use a dollar sign ("$") when producing symbol names.
Qvc	Specifies compatibility with Microsoft Visual C++* (MSVC) or Microsoft Visual Studio*.
Qvla	Determines whether variable length arrays are enabled.
rcd, Qrcd	Enables fast float-to-integer conversions. This is a deprecated option that may be removed in a future release.
regcall, Qregcall	Tells the compiler that the __regcall calling convention should be used for functions that do not directly specify a calling convention.
restrict, Qrestrict	Determines whether pointer disambiguation is enabled with the restrict qualifier.
RTC	Enables checking for certain run-time conditions.
S	Causes the compiler to compile to an assembly file only and not link.
save-temps , Qsave-temps	Tells the compiler to save intermediate files created during compilation.
scalar-rep, Qscalar-rep	Enables or disables the scalar replacement optimization done by the compiler as part of loop transformations.
shared	Tells the compiler to produce a dynamic shared object instead of an executable.
shared-intel	Causes Intel-provided libraries to be linked in dynamically.
shared-libgcc	Links the GNU libgcc library dynamically.
showIncludes	Tells the compiler to display a list of the include files.
simd, Qsimd	Enables or disables compiler interpretation of simd pragmas.
simd-function-pointers, Qsimd-function-pointers	Enables or disables pointers to simd-enabled functions.

sox	Tells the compiler to save the compilation options and version number in the executable file. It also lets you choose whether to include lists of certain functions .
static	Prevents linking with shared libraries.
static-intel	Causes Intel-provided libraries to be linked in statically.
static-libgcc	Links the GNU libgcc library statically.
staticlib	Invokes the libtool command to generate static libraries.
static-libstdc++	Links the GNU libstdc++ library statically.
std, Qstd	Tells the compiler to conform to a specific language standard.
stdlib	Lets you select the C++ library to be used for linking.
strict-ansi	Tells the compiler to implement strict ANSI conformance dialect.
sysroot	Specifies the root directory where headers and libraries are located.
T	Tells the linker to read link commands from a file.
Tc	Tells the compiler to process a file as a C source file.
TC	Tells the compiler to process all source or unrecognized file types as C source files.
Tp	Tells the compiler to process a file as a C++ source file.
traceback	Tells the compiler to generate extra information in the object file to provide source file traceback information when a severe error occurs at run time.
U	Undefines any definition currently in effect for the specified macro .
u (Linux*)	Tells the compiler the specified symbol is undefined.
u (Windows*)	Disables all predefined macros and assertions.
undef	Disables all predefined macros .
unroll , Qunroll	Tells the compiler the maximum number of times to unroll loops.
unroll-aggressive, Qunroll-aggressive	Determines whether the compiler uses more aggressive unrolling for certain loops.
use-asm, Quse-asm	Tells the compiler to produce objects through the assembler. This is a deprecated option that may be removed in a future release.
use-intel-optimized-headers, Quse-intel-optimized-headers	Determines whether the performance headers directory is added to the include path search list.
use-msasm	Enables the use of blocks and entire functions of assembly code within a C or C++ file.
V	Displays the compiler version information.
V (Windows*)	Places the text string specified into the object file being generated by the compiler.
v	Specifies that driver tool commands should be displayed and executed.
vd	Enables or suppresses hidden vtordisp members in C++ objects.

vec, Qvec	Enables or disables vectorization.
vecabi, Qvecabi	Determines which vector function application binary interface (ABI) the compiler uses to create or call vector functions.
vec-guard-write, Qvec-guard-write	Tells the compiler to perform a conditional check in a vectorized loop.
vec-threshold, Qvec-threshold	Sets a threshold for the vectorization of loops.
version	Tells the compiler to display GCC-style version information.
vmb	Selects the smallest representation that the compiler uses for pointers to members.
vmg	Selects the general representation that the compiler uses for pointers to members.
vmm	Enables pointers to class members with single or multiple inheritance.
vms	Enables pointers to members of single-inheritance classes.
vmv	Enables pointers to members of any inheritance type.
w	Disables all warning messages.
w, W	Specifies the level of diagnostic messages to be generated by the compiler.
Wa	Passes options to the assembler for processing.
Wabi	Determines whether a warning is issued if generated code is not C++ ABI compliant.
Wall	Enables warning and error diagnostics.
watch	Tells the compiler to display certain information to the console output window.
Wbrief	Tells the compiler to display a shorter form of diagnostic output.
Wcheck	Tells the compiler to perform compile-time code checking for certain code.
Wcheck-unicode-security	Determines whether the compiler performs source code checking for Unicode vulnerabilities.
Wcomment	Determines whether a warning is issued when /* appears in the middle of a /* */ comment.
Wcontext-limit, Qcontext-limit	Set the maximum number of template instantiation contexts shown in diagnostic.
wd, Qwd	Disables a soft diagnostic. This is a deprecated option that may be removed in a future release.
Wdeprecated	Determines whether warnings are issued for deprecated C++ headers.
we, Qwe	Changes a soft diagnostic to an error. This is a deprecated option that may be removed in a future release.
Weffc++, Qeffc++	Enables warnings based on certain C++ programming guidelines.
Werror, WX	Changes all warnings to errors.

Werror-all	Causes all warnings and currently enabled remarks to be reported as errors.
Wextra-tokens	Determines whether warnings are issued about extra tokens at the end of preprocessor directives.
Wformat	Determines whether argument checking is enabled for calls to printf, scanf, and so forth.
Wformat-security	Determines whether the compiler issues a warning when the use of format functions may cause security problems.
Wic-pointer	Determines whether warnings are issued for conversions between pointers to distinct scalar types with the same representation.
Winline	Warns when a function that is declared as inline is not inlined.
Wl	Passes options to the linker for processing.
WL	Tells the compiler to display a shorter form of diagnostic output.
Wmain	Determines whether a warning is issued if the return type of main is not expected.
Wmissing-declarations	Determines whether warnings are issued for global functions and variables without prior declaration.
Wmissing-prototypes	Determines whether warnings are issued for missing prototypes.
wn, Qwn	Controls the number of errors displayed before compilation stops. This is a deprecated option that may be removed in a future release.
Wnon-virtual-dtor	Tells the compiler to issue a warning when a class appears to be polymorphic, yet it declares a non-virtual one.
wo, Qwo	Tells the compiler to issue one or more diagnostic messages only once. This is a deprecated option that may be removed in a future release.
Wp	Passes options to the preprocessor.
Wp64	Tells the compiler to display diagnostics for 64-bit porting.
Wpch-messages	Determines whether the compiler shows precompiled header (PCH) informational messages.
Wpointer-arith	Determines whether warnings are issued for questionable pointer arithmetic.
Wport	Tells the compiler to issue portability diagnostics.
wr, Qwr	Changes a soft diagnostic to an remark. This is a deprecated option that may be removed in a future release.
Wremarks	Tells the compiler to display remarks and comments.
Wreorder	Tells the compiler to issue a warning when the order of member initializers does not match the order in which they must be executed.
Wreturn-type	Determines whether warnings are issued when a function is declared without a return type, when the definition of a function returning void contains a return statement with an expression, or when the closing brace of a function returning non-void is reached.
Wshadow	Determines whether a warning is issued when a variable declaration hides a previous declaration.

Wsign-compare	Determines whether warnings are issued when a comparison between signed and unsigned values could produce an incorrect result when the signed value is converted to unsigned.
Wstrict-aliasing	Determines whether warnings are issued for code that might violate the optimizer's strict aliasing rules.
Wstrict-prototypes	Determines whether warnings are issued for functions declared or defined without specified argument types.
Wtrigraphs	Determines whether warnings are issued if any trigraphs are encountered that might change the meaning of the program.
Wuninitialized	Determines whether a warning is issued if a variable is used before being initialized.
Wunknown-pragmas	Determines whether a warning is issued if an unknown #pragma directive is used.
Wunused-function	Determines whether a warning is issued if a declared function is not used.
Wunused-variable	Determines whether a warning is issued if a local or non-constant static variable is unused after being declared.
ww, Qww	Changes a soft diagnostic to an warning. This is a deprecated option that may be removed in a future release.
Wwrite-strings	Issues a diagnostic message if const char * is converted to (non-const) char *.
X	Removes standard directories from the include file search path.
x (type option)	All source files found subsequent to -x type will be recognized as a particular type.
x, Qx	Tells the compiler which processor features it may target, including which instruction sets and optimizations it may generate.
xHost, QxHost	Tells the compiler to generate instructions for the highest instruction set available on the compilation host processor.
Xlinker	Passes a linker option directly to the linker.
Y-	Tells the compiler to ignore all other precompiled header files.
Yc	Tells the compiler to create a precompiled header file.
Yd	Tells the compiler to add complete debugging information in all object files created from a precompiled header file when option /Zi or /Z7 is specified. This is a deprecated option that may be removed in a future release.
Yu	Tells the compiler to use a precompiled header file.
Za	Disables Microsoft* Visual C++* compiler language extensions.
Zc	Lets you specify ANSI C standard conformance for certain language features.
Ze	Enables Microsoft* Visual C++* compiler language extensions. This is a deprecated option that may be removed in a future release.
Zg	Tells the compiler to generate function prototypes. This is a deprecated option that may be removed in a future release.

Zi, Z7 , ZI	Tells the compiler to generate full debugging information in either an object (.obj) file or a project database (PDB) file.
Zl	Causes library names to be omitted from the object file.
Zo	Enables or disables generation of enhanced debugging information for optimized code.
Zp	Specifies alignment for structures on byte boundaries.
Zs	Tells the compiler to check only for correct syntax.

General Rules for Compiler Options

This section describes general rules for compiler options and it contains information about how we refer to compiler option names in descriptions.

General Rules for Compiler Options

Compiler options may be case sensitive, and may have different meanings depending on their case. For example, option `c` prevents linking, but option `C` places comments in preprocessed source output.

Options specified on the command line apply to all files named on the command line.

Options can take arguments in the form of file names, strings, letters, or numbers. If a string includes spaces, the string must be enclosed in quotation marks.

Compiler options can appear in any order.

Unless you specify certain options, the command line will both compile and link the files you specify.

You can abbreviate some option names, entering as many characters as are needed to uniquely identify the option.

Certain options accept one or more keyword arguments following the option name. For example, architecture option `x` option accepts several keywords.

To specify multiple keywords, you typically specify the option multiple times.

To disable an option, specify the negative form of the option if one exists.

If there are enabling and disabling versions of an option on the command line, the last one on the command line takes precedence.

Compiler options remain in effect for the whole compilation unless overridden by a compiler #pragma.

Linux and macOS

You cannot combine options with a single dash. For example, this form is incorrect: `-Ec`; this form is correct: `-E -c`

Windows

You cannot combine options with a single slash. For example: This form is incorrect: `/Ec`; this form is correct: `/E /c`

All compiler options must precede `/link` options, if any, on the command line.

Compiler options remain in effect for the whole compilation unless overridden by a compiler #pragma.

You can disable one or more optimization options by specifying option `/Od` last on the command line.

NOTE
The /Od option is part of a mutually-exclusive group of options that includes /Od, /O1, /O2, /O3, and /Ox. The last of any of these options specified on the command line will override the previous options from this group.

How We Refer to Compiler Option Names in Descriptions

Within documentation, compiler option names that are very different are spelled out in full.

However, many compiler option names are very similar except for initial characters. For these options, we use the following shortcuts when referencing their names in descriptions:

- No initial – or /

  This shortcut is used for option names that are the same for Linux and Windows except for the initial character.

  For example, Fa denotes:

  - Linux and macOS: -Fa
  - Windows: /Fa
- [Q]option-name

  This shortcut is used for option names that only differ because the Windows form starts with a Q.

  For example, [Q]ipo denotes:

  - Linux and macOS: -ipo
  - Windows: /Qipo
- [q or Q]option-name

  This shortcut is used for option names that only differ because the Linux form starts with a q and the Windows form starts with a Q.

  For example, [q or Q]opt-report denotes:

  - Linux and macOS: -qopt-report
  - Windows: /Qopt-report

What Appears in the Compiler Option Descriptions

This section contains details about what appears in the option descriptions.

Following sections include individual descriptions of all the current compiler options. The option descriptions are arranged by functional category. Within each category, the option names are listed in alphabetical order.

Each option description contains the following information:

- The primary name for the option and a short description of the option.
- Architecture Restrictions

  This section only appears if there is a known architecture restriction for the option.

  Restrictions can appear for any of the following architectures:

  - IA-32 architecture
  - Intel® 64 architecture

  Certain operating systems are not available on all the above architectures. For the latest information, check your Release Notes.
- Syntax

This section shows the syntax on Linux* and macOS systems and the syntax on Windows* systems. If the option is not valid on a particular operating system, it will specify "None".

- Arguments

  This section shows any arguments (parameters) that are related to the option. If the option has no arguments, it will specify "None".
- Default

  This section shows the default setting for the option.
- Description

  This section shows the full description of the option. It may also include further information on any applicable arguments.
- IDE Equivalent

  This section shows information related to the Intel® Integrated Development Environment (Intel® IDE) Property Pages on Linux*, macOS, and Windows* systems. It shows on which Property Page the option appears, and under what category it's listed. The Windows* IDE is Microsoft* Visual Studio* .NET; the Linux* IDE is Eclipse*; the macOS IDE is Xcode*. If the option has no IDE equivalent, it will specify "None".
- Alternate Options

  This section lists any options that are synonyms for the described option. If there are no alternate option names, it will show "None".

  Some alternate option names are deprecated and may be removed in future releases.

  Many options have an older spelling where underscores ("_") instead of hyphens ("-") connect the main option names. The older spelling is a valid alternate option name.

Some option descriptions may also have the following:

- Example (or Examples)

  This section shows one or more examples that demonstrate the option.
- See Also

  This section shows where you can get further information on the option or it shows related options.

Optimization Options

This section contains descriptions for compiler options that pertain to optimization.

falias, Oa

Determines whether aliasing is assumed in a program.

Syntax

Linux OS and macOS:

`-falias`

`-fno-alias`

Windows OS:

`/Oa`

`/Oa-`

Arguments

None

Default

`-falias` or `/Oa-`	On Linux* and macOS, aliasing is assumed in the program. On Windows*, aliasing is not assumed in a program.

Description

This option determines whether aliasing is assumed in a program.

If you specify `-fno-alias` or `/Oa`, aliasing is not assumed in a program.

If you specify `-falias` or `/Oa-`, aliasing is assumed in a program. However, this may affect performance.

IDE Equivalent

Visual Studio: None

Eclipse: **Data > Assume No Aliasing in Program**

Xcode: **Data > Assume No Aliasing in Program**

Alternate Options

None

See Also

`ffnalias` compiler option

fast

Maximizes speed across the entire program.

Syntax

Linux OS:

`-fast`

macOS:

`-fast`

Windows OS:

`/fast`

Arguments

None

Default

OFF	The optimizations that maximize speed are not enabled.

Description

This option maximizes speed across the entire program.

It sets the following options:

- On macOS systems: `-ipo`, `-mdynamic-no-pic`,`-O3`, `-no-prec-div`,`-fp-model fast=2`, and `-xHost`
- On Windows* systems: `/O3`, `/Qipo`, `/Qprec-div-`, `/fp:fast=2`, and `/QxHost`
- On Linux* systems: `-ipo`, `-O3`, `-no-prec-div`,`-static`, `-fp-model fast=2`, and `-xHost`

When option `fast` is specified, you can override the `[Q]xHost` option setting by specifying a different processor-specific `[Q]x` option on the command line. However, the last option specified on the command line takes precedence.

For example:

- On Linux* systems, if you specify option `-fast -xSSE3`, option `-xSSE3` takes effect. However, if you specify `-xSSE3 -fast`, option `-xHost` takes effect.
- On Windows* systems, if you specify option `/fast /QxSSE3`, option`/QxSSE3` takes effect. However, if you specify `/QxSSE3 /fast`, option `/QxHost` takes effect.

For implications on non-Intel processors, refer to the `[Q]xHost` documentation.

NOTE
Option `fast` sets some aggressive optimizations that may not be appropriate for all applications. The resulting executable may not run on processor types different from the one on which you compile. You should make sure that you understand the individual optimization options that are enabled by option `fast`.

Product and Performance Information
Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex. Notice revision #20201201

IDE Equivalent

None

Alternate Options

None

fp-model, fp compiler option

xHost, QxHost
compiler option

x, Qx
compiler option

fbuiltin, Oi

Enables or disables inline expansion of intrinsic functions.

Syntax

Linux OS:

`-fbuiltin[-name]`

`-fno-builtin[-name]`

macOS:

`-fbuiltin[-name]`

`-fno-builtin[-name]`

Windows OS:

`/Oi[-]`

`/Qno-builtin-name`

Arguments

name	Is a list of one or more intrinsic functions. If there is more than one intrinsic function, they must be separated by commas.

Default

ON	Inline expansion of intrinsic functions is enabled.

Description

This option enables or disables inline expansion of one or more intrinsic functions.

If `-fno-builtin-`*name* or `/Qno-builtin-`*name* is specified, inline expansion is disabled for the named functions. If *name* is not specified, `-fno-builtin` or `/Oi-` disables inline expansion for all intrinsic functions.

For a list of built-in functions affected by `-fbuiltin`, search for "built-in functions" in the appropriate gcc* documentation.

For a list of built-in functions affected by `/Oi`, search for "/Oi" in the appropriate Microsoft* Visual C/C++* documentation.

IDE Equivalent

Visual Studio: **Optimization > Enable Intrinsic Functions** (/Oi)

Eclipse: None

Xcode: None

Alternate Options

None

fdefer-pop

Determines whether the compiler always pops the arguments to each function call as soon as that function returns.

Syntax

Linux OS and macOS:

`-fdefer-pop`

`-fno-defer-pop`

Windows OS:

`None`

Arguments

None

Default

`-fdefer-pop`	The compiler uses default optimizations that may result in deferred clearance of the stack arguments.

Description

This option determines whether the compiler always pops the arguments to each function call as soon as that function returns.

If you want the compiler to always pop the arguments to each function call as soon as that function returns, specify `-fno-defer-pop`.

For processors that must pop arguments after a function call, the compiler normally lets arguments accumulate on the stack for several function calls and pops them all at once.

IDE Equivalent

None

Alternate Options

None

ffnalias, Ow

Determines whether aliasing is assumed within functions.

Syntax

Linux OS and macOS:

`-ffnalias`

`-fno-fnalias`

Windows OS:

`/Ow`

`/Ow-`

Arguments

None

Default

`-ffnalias` or `/Ow`	Aliasing is assumed within functions.

Description

This option determines whether aliasing is assumed within functions.

If you specify `-fno-fnalias` or `/Ow-`, aliasing is not assumed within functions, but it is assumed across calls.

If you specify `-ffnalias` or `/Ow`, aliasing is assumed within functions.

IDE Equivalent

None

Alternate Options

None

See Also

falias compiler option

foptimize-sibling-calls

Determines whether the compiler optimizes tail recursive calls.

Syntax

Linux OS:

`-foptimize-sibling-calls`

`-fno-optimize-sibling-calls`

macOS:

`-foptimize-sibling-calls`

`-fno-optimize-sibling-calls`

Windows OS:

None

Arguments

None

Default

`-foptimize-sibling-calls`	The compiler optimizes tail recursive calls.

Description

This option determines whether the compiler optimizes tail recursive calls. It enables conversion of tail recursion into loops.

If you do not want to optimize tail recursive calls, specify `-fno-optimize-sibling-calls`.

Tail recursion is a special form of recursion that doesn't use stack space. In tail recursion, a recursive call is converted to a GOTO statement that returns to the beginning of the function. In this case, the return value of the recursive call is only used to be returned. It is not used in another expression. The recursive function is converted into a loop, which prevents modification of the stack space used.

IDE Equivalent

None

Alternate Options

None

fprotect-parens, Qprotect-parens

Determines whether the optimizer honors parentheses when floating-point expressions are evaluated.

Syntax

Linux OS and macOS:

`-fprotect-parens`

`-fno-protect-parens`

Windows OS:

`/Qprotect-parens`

`/Qprotect-parens-`

Arguments

None

Default

`-fno-protect-parens` or `/Qprotect-parens-`	Parentheses are ignored when determining the order of expression evaluation.

Description

This option determines whether the optimizer honors parentheses when determining the order of floating-point expression evaluation.

When option `-fprotect-parens` (Linux* and macOS) or `/Qprotect-parens` (Windows*) is specified, the optimizer will maintain the order of evaluation imposed by parentheses in the code.

When option `-fno-protect-parens` (Linux* and macOS) or `/Qprotect-parens-` (Windows*) is specified, the optimizer may reorder floating-point expressions without regard for parentheses if it produces faster executing code.

IDE Equivalent

None

Alternate Options

None

Example

Consider the following expression:

```
A+(B+C)
```

By default, the parentheses are ignored and the compiler is free to re-order the floating-point operations based on the optimization level, the setting of option `-fp-model` (Linux* and macOS) or `/fp` (Windows*), etc. to produce faster code. Code that is sensitive to the order of operations may produce different results (such as with some floating-point computations).

However, if `-fprotect-parens` (Linux* and macOS) or `/Qprotect-parens` (Windows*) is specified, parentheses around floating-point expressions (including complex floating-point and decimal floating-point) are honored and the expression will be interpreted following the normal precedence rules, that is, B+C will be computed first and then added to A.

This may produce slower code than when parentheses are ignored. If floating-point sensitivity is a specific concern, you should use option `-fp-model precise` (Linux* and macOS) or `/fp:precise` (Windows*) to ensure precision because it controls all optimizations that may affect precision.

`fp-model, fp` compiler option

GF

Enables read-only string-pooling optimization.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/GF`

Arguments

None

Default

OFF	Read/write string-pooling optimization is enabled.

Description

This option enables read only string-pooling optimization.

IDE Equivalent

Visual Studio: **Code Generation > Enable String Pooling**

Eclipse: None

Xcode: None

Alternate Options

None

nolib-inline

Disables inline expansion of standard library or intrinsic functions.

Syntax

Linux OS:

`-nolib-inline`

macOS:

`-nolib-inline`

Windows OS:

None

Arguments

None

Default

OFF	The compiler inlines many standard library and intrinsic functions.

Description

This option disables inline expansion of standard library or intrinsic functions. It prevents the unexpected results that can arise from inline expansion of these functions.

IDE Equivalent

Visual Studio: None

Eclipse: **Optimization > Disable Intrinsic Inline Expansion**

Xcode: **Optimization > Disable Intrinsic Inline Expansion**

Alternate Options

None

O

Specifies the code optimization for applications.

Syntax

Linux OS:

`-O[`*n*`]`

macOS:

`-O[`*n*`]`

Windows OS:

`/O[`*n*`]`

Arguments

n	Is the optimization level. Possible values are 1, 2, or 3. On Linux* and macOS systems, you can also specify 0.

Default

O2	Optimizes for code speed. This default may change depending on which other compiler options are specified. For details, see below.

Description

This option specifies the code optimization for applications.

<table>
<tr><th>Option</th><th>Description</th></tr>
<tr><td><code>O</code> (Linux* and macOS)</td><td>This is the same as specifying <code>O2</code>.</td></tr>
<tr><td><code>O0</code> (Linux and macOS)</td><td>Disables all optimizations.

This option may set other options. This is determined by the compiler, depending on which operating system and architecture you are using. The options that are set may change from release to release.</td></tr>
<tr><td><code>O1</code></td><td>Enables optimizations for speed and disables some optimizations that increase code size and affect speed.
To limit code size, this option:

Enables global optimization; this includes data-flow analysis, code motion, strength reduction and test replacement, split-lifetime analysis, and instruction scheduling.
Disables inlining of some intrinsics.

This option may set other options. This is determined by the compiler, depending on which operating system and architecture you are using. The options that are set may change from release to release.

The <code>O1</code> option may improve performance for applications with very large code size, many branches, and execution time not dominated by code within loops.</td></tr>
<tr><td><code>O2</code></td><td>Enables optimizations for speed. This is the generally recommended optimization level.
Vectorization is enabled at <code>O2</code> and higher levels.

On systems using IA-32 architecture: Some basic loop optimizations such as Distribution, Predicate Opt, Interchange, multi-versioning, and scalar replacements are performed.

This option also enables:

Inlining of intrinsics
Intra-file interprocedural optimization, which includes:

inlining
constant propagation
forward substitution
routine attribute propagation
variable address-taken analysis
dead static function elimination
removal of unreferenced variables

The following capabilities for performance gain:

constant propagation
copy propagation
dead-code elimination
global register allocation
global instruction scheduling and control speculation
loop unrolling
optimized code selection
partial redundancy elimination
strength reduction/induction variable simplification
variable renaming

</td></tr>
</table>

Option	Description
	• exception handling optimizations • tail recursions • peephole optimizations • structure assignment lowering and optimizations • dead store elimination This option may set other options, especially options that optimize for code speed. This is determined by the compiler, depending on which operating system and architecture you are using. The options that are set may change from release to release. On Linux systems, the `-debug inline-debug-info` option will be enabled by default if you compile with optimizations (option `-O2` or higher) and debugging is enabled (option `-g`). Many routines in the shared libraries are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.
`O3`	Performs `O2` optimizations and enables more aggressive loop transformations such as Fusion, Block-Unroll-and-Jam, and collapsing IF statements. This option may set other options. This is determined by the compiler, depending on which operating system and architecture you are using. The options that are set may change from release to release. When `O3` is used with options `-ax` or `-x` (Linux) or with options `/Qax` or `/Qx` (Windows), the compiler performs more aggressive data dependency analysis than for `O2`, which may result in longer compilation times. The `O3` optimizations may not cause higher performance unless loop and memory access transformations take place. The optimizations may slow down code in some cases compared to `O2` optimizations. The `O3` option is recommended for applications that have loops that heavily use floating-point calculations and process large data sets. Many routines in the shared libraries are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.

The last `O` option specified on the command line takes precedence over any others.

IDE Equivalent

Visual Studio: **Optimization > Optimization**

Eclipse: **General > Optimization Level**

Xcode: **General > Optimization Level**

Alternate Options

`O0`	Linux: None Windows: `/Od`

See Also

`Od` compiler option

Od

Disables all optimizations.

Syntax

Linux OS:

None

macOS:

None

Windows OS:

/Od

Arguments

None

Default

OFF	The compiler performs default optimizations.

Description

This option disables all optimizations. It can be used for selective optimizations, such as a combination of /Od and /Ob1 (disables all optimizations, but enables inlining).

On IA-32 architecture, this option sets the /Oy- option.

IDE Equivalent

Visual Studio: **Optimization > Optimization**

Eclipse: None

Xcode: None

Alternate Options

Linux and macOS: -O0

Windows: None

See Also

O compiler option (see O0)

Ofast

Sets certain aggressive options to improve the speed of your application.

Syntax

Linux OS:

-Ofast

macOS:

-Ofast

Windows OS:

`None`

Arguments

None

Default

OFF	The aggressive optimizations that improve speed are not enabled.

Description

This option improves the speed of your application.

It sets compiler options `-O3`, `-no-prec-div`, and -fp-model fast=2.

On Linux* systems, this option is provided for compatibility with gcc.

IDE Equivalent

None

Alternate Options

None

See Also

`O` compiler option

`prec-div, Qprec-div` compiler option

`fast` compiler option

`fp-model, fp` compiler option

Os

Enables optimizations that do not increase code size; it produces smaller code size than O2.

Syntax

Linux OS:

`-Os`

macOS:

`-Os`

Windows OS:

`/Os`

Arguments

None

Default

OFF	Optimizations are made for code speed. However, if `O1` is specified, `Os` is the default.

Description

This option enables optimizations that do not increase code size; it produces smaller code size than `O2`. It disables some optimizations that increase code size for a small speed benefit.

This option tells the compiler to favor transformations that reduce code size over transformations that produce maximum performance.

IDE Equivalent

Visual Studio: **Optimization > Favor Size or Speed**

Eclipse: None

Xcode: None

Alternate Options

None

See Also

`O` compiler option
`Ot` compiler option

Ot

Enables all speed optimizations.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Ot`

Arguments

None

Default

`/Ot`	Optimizations are made for code speed. If `Od` is specified, all optimizations are disabled. If `O1` is specified, `Os` is the default.

Description

This option enables all speed optimizations.

IDE Equivalent

Visual Studio: **Optimization > Favor Size or Speed**

Eclipse: None

Xcode: None

Alternate Options

None

`O` compiler option
`Os` compiler option

Ox

Enables maximum optimizations.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Ox`

Arguments

None

Default

OFF	The compiler does not enable optimizations.

Description

The compiler enables maximum optimizations by combining the following options:

- /Ob2
- /Oy
- /Ot
- /Oi

IDE Equivalent

Visual Studio: **Optimization > Optimization**

Eclipse: None

Xcode: None

Alternate Options

None

Code Generation Options

This section contains descriptions for compiler options that pertain to code generation.

arch

Tells the compiler which features it may target, including which instruction sets it may generate.

Syntax

Linux OS:

None

macOS:

None

Windows OS:

/arch:*code*

Arguments

code — Indicates to the compiler a feature set that it may target, including which instruction sets it may generate. Many of the following descriptions refer to Intel® Streaming SIMD Extensions (Intel® SSE) and Supplemental Streaming SIMD Extensions (SSSE). Possible values are:

ALDERLAKE AMBERLAKE BROADWELL CANNONLAKE CASCADELAKE COFFEELAKE COOPERLAKE GOLDMONT GOLDMONT-PLUS HASWELL ICELAKE-CLIENT (or ICELAKE) ICELAKE-SERVER IVYBRIDGE KABYLAKE KNL KNM ROCKETLAKE SANDYBRIDGE SAPPHIRERAPIDS SILVERMONT SKYLAKE SKYLAKE-AVX512 TIGERLAKE TREMONT WHISKEYLAKE	May generate instructions for processors that support the specified Intel® processor or microarchitecture code name. Keyword ICELAKE is deprecated and may be removed in a future release.
CORE-AVX2	May generate Intel® Advanced Vector Extensions 2 (Intel® AVX2), Intel® AVX, SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.

`CORE-AVX-I`	May generate Float-16 conversion instructions and the RDRND instruction, Intel® Advanced Vector Extensions (Intel® AVX), Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.
`AVX2`	May generate Intel® Advanced Vector Extensions 2 (Intel® AVX2), Intel® AVX, Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.
`AVX`	May generate Intel® Advanced Vector Extensions (Intel® AVX), Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.
`SSE4.2`	May generate Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.
`SSE4.1`	May generate Intel® SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.
`SSSE3`	May generate SSSE3 instructions and Intel® SSE3, SSE2, and SSE instructions.
`SSE3`	May generate Intel® SSE3, SSE2, and SSE instructions.
`SSE2`	May generate Intel® SSE2 and SSE instructions.
`SSE`	This option has been deprecated; it is now the same as specifying `IA32`.
`IA32`	Generates x86/x87 generic code that is compatible with IA-32 architecture. Disables any default extended instruction settings, and any previously set extended instruction settings. It also disables all feature-specific optimizations and instructions. This value is only available on IA-32 architecture.

Default

SSE2	The compiler may generate Intel® SSE2 and SSE instructions.

Description

This option tells the compiler which features it may target, including which instruction sets it may generate.

Code generated with these options should execute on any compatible, non-Intel processor with support for the corresponding instruction set.

Options `/arch` and `/Qx` are mutually exclusive. If both are specified, the compiler uses the last one specified and generates a warning.

If you specify both the `/Qax` and `/arch` options, the compiler will not generate Intel-specific instructions.

IDE Equivalent

Visual Studio

Visual Studio: **Code Generation > Enable Enhanced Instruction Set**

Eclipse

Eclipse: None

Xcode

Xcode: None

Alternate Options

None

`march` compiler option

`m` compiler option

`m32, m64` compiler option

ax, Qax

Tells the compiler to generate multiple, feature-specific auto-dispatch code paths for Intel® processors if there is a performance benefit.

Syntax

Linux OS:

`-ax`*code*

macOS:

`-ax`*code*

Windows OS:

`/Qax`*code*

Arguments

code Indicates to the compiler a feature set that it may target, including which instruction sets it may generate. The following descriptions refer to Intel® Streaming SIMD Extensions (Intel® SSE) and Supplemental Streaming SIMD Extensions (SSSE). Possible values are:

`ALDERLAKE`
`AMBERLAKE`
`BROADWELL`
`CANNONLAKE`
`CASCADELAKE`
`COFFEELAKE`
`COOPERLAKE`
`GOLDMONT`
`GOLDMONT-PLUS`
`HASWELL`
`ICELAKE-CLIENT` (or `ICELAKE`)
	May generate instructions for processors that support the specified Intel® processor or microarchitecture code name.
	
	Keywords `KNL` and `SILVERMONT` are only available on Windows* and Linux* systems.
	
	Keyword `ICELAKE` is deprecated and may be removed in a future release.

`ICELAKE-SERVER`
`IVYBRIDGE`
`KABYLAKE`
`KNL`
`KNM`
`ROCKETLAKE`
`SANDYBRIDGE`
`SAPPHIRERAPIDS`
`SILVERMONT`
`SKYLAKE`
`SKYLAKE-AVX512`
`TIGERLAKE`
`TREMONT`
`WHISKEYLAKE`	

`COMMON-AVX512`	May generate Intel® Advanced Vector Extensions 512 (Intel® AVX-512) Foundation instructions, Intel® AVX-512 Conflict Detection Instructions (CDI), as well as the instructions enabled with CORE-AVX2.
`CORE-AVX512`	May generate Intel® Advanced Vector Extensions 512 (Intel® AVX-512) Foundation instructions, Intel® AVX-512 Conflict Detection Instructions (CDI), Intel® AVX-512 Doubleword and Quadword Instructions (DQI), Intel® AVX-512 Byte and Word Instructions (BWI) and Intel® AVX-512 Vector Length extensions, as well as the instructions enabled with CORE-AVX2.
`CORE-AVX2`	May generate Intel® Advanced Vector Extensions 2 (Intel® AVX2), Intel® AVX, SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions for Intel® processors.
`CORE-AVX-I`	May generate Float-16 conversion instructions and the RDRND instruction, Intel® Advanced Vector Extensions (Intel® AVX), Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions for Intel® processors.
`AVX`	May generate Intel® Advanced Vector Extensions (Intel® AVX), Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions for Intel® processors.
`SSE4.2`	May generate Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions for Intel processors.
`SSE4.1`	May generate Intel® SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions for Intel® processors.
`SSSE3`	May generate SSSE3 instructions and Intel® SSE3, SSE2, and SSE instructions for Intel® processors. For macOS systems, this value is only supported on Intel® 64 architecture. This replaces value T, which is deprecated.
`SSE3`	May generate Intel® SSE3, SSE2, and SSE instructions for Intel® processors. This value is not available on macOS systems.

`SSE2`	May generate Intel® SSE2 and SSE instructions for Intel® processors. This value is not available on macOS systems.

You can specify more than one *code* value. When specifying more than one *code* value, each value must be separated with a comma. See the Examples section below.

Default

OFF	No auto-dispatch code is generated. Feature-specific code is generated and is controlled by the setting of the following compiler options: • Linux*: `-m` and `-x` • Windows*: `/arch` and `/Qx` • macOS: `-x`

Description

This option tells the compiler to generate multiple, feature-specific auto-dispatch code paths for Intel® processors if there is a performance benefit. It also generates a baseline code path. The Intel feature-specific auto-dispatch path is usually more optimized than the baseline path. Other options, such as `O3`, control how much optimization is performed on the baseline path.

The baseline code path is determined by the architecture specified by options `-m` or `-x` (Linux* and macOS) or options `/arch` or `/Qx` (Windows*). While there are defaults for the `[Q]x` option that depend on the operating system being used, you can specify an architecture and optimization level for the baseline code that is higher or lower than the default. The specified architecture becomes the effective minimum architecture for the baseline code path.

If you specify both the `[Q]ax` and `[Q]x` options, the baseline code will only execute on Intel® processors compatible with the setting specified for the `[Q]x`.

If you specify both the `-ax` and `-m` options (Linux and macOS) or the `/Qax` and `/arch` options (Windows), the baseline code will execute on non-Intel processors compatible with the setting specified for the `-m` or `/arch` option.

If you specify both the `-ax` and `-march` options (Linux and macOS), or the `/Qax` and `/arch` options (Windows), the compiler will not generate Intel-specific instructions. This is because specifying `-march` disables `-ax` and specifying `/arch` disables `/Qax`.

The `[Q]ax` option tells the compiler to find opportunities to generate separate versions of functions that take advantage of features of the specified instruction features.

If the compiler finds such an opportunity, it first checks whether generating a feature-specific version of a function is likely to result in a performance gain. If this is the case, the compiler generates both a feature-specific version of a function and a baseline version of the function. At run time, one of the versions is chosen to execute, depending on the Intel® processor in use. In this way, the program can benefit from performance gains on more advanced Intel processors, while still working properly on older processors and non-Intel processors. A non-Intel processor always executes the baseline code path.

You can use more than one of the feature values by combining them. For example, you can specify `-axSSE4.1,SSSE3` (Linux and macOS) or `/QaxSSE4.1,SSSE3` (Windows). You cannot combine the old style, deprecated options and the new options. For example, you cannot specify `-axSSE4.1,T` (Linux and macOS) or `/QaxSSE4.1,T` (Windows).

EH

Specifies the model of exception handling to be performed.

Syntax

Linux OS:

None

macOS:

None

Windows OS:

/EH*type*

/EH*type*-

Arguments

type	Specifies the exception handling model. Possible values are:	
	`a`	Specifies the asynchronous C++ exception handling model.
	`s`	Specifies the synchronous C++ exception handling model.
	`c`	Tells the compiler to assume that extern "C" functions do not throw exceptions.
	`r`	Tells the compiler to always generate runtime termination checks for all noexcept functions. IT forces runtime termination checks in all functions that have a noexcept attribute.

If you specify `c`, you must also specify `a` or `s`.

Default

OFF	Some exception handling is performed by default.

Description

This option specifies the model of exception handling to be performed.

If you specify the negative form of the option, it disables the exception handling performed by *type* or the last *type* if there are two. For example, if you specify `/EHsc-`, it is interpreted as `/EHs`.

For more details about option `/EH`, see the Microsoft documentation.

IDE Equivalent

`Qsafeseh` compiler option

fasynchronous-unwind-tables

Determines whether unwind information is precise at an instruction boundary or at a call boundary.

Syntax

Linux OS:

`-fasynchronous-unwind-tables`

`-fno-asynchronous-unwind-tables`

macOS:

`-fasynchronous-unwind-tables`

`-fno-asynchronous-unwind-tables`

Windows OS:

`None`

Arguments

None

Default

Intel® 64 architecture: `-fasynchronous-unwind-tables`	The unwind table generated is precise at an instruction boundary, enabling accurate unwinding at any instruction.
IA-32 architecture (Linux* only): `-fno-asynchronous-unwind-tables`	The unwind table generated is precise at call boundaries only.

Description

This option determines whether unwind information is precise at an instruction boundary or at a call boundary. The compiler generates an unwind table in DWARF2 or DWARF3 format, depending on which format is supported on your system.

If `-fno-asynchronous-unwind-tables` is specified, the unwind table is precise at call boundaries only. In this case, the compiler will avoid creating unwind tables for routines such as the following:

- A C++ routine that does not declare objects with destructors and does not contain calls to routines that might throw an exception.
- A C/C++ or Fortran routine compiled without `-fexceptions`, and on Intel® 64 architecture, without `-traceback`.
- A C/C++ or Fortran routine compiled with `-fexceptions` that does not contain calls to routines that might throw an exception.

fexceptions compiler option

fcf-protection, Qcf-protection

Enables Intel® Control-Flow Enforcement Technology (Intel® CET) protection, which defends your program from certain attacks that exploit vulnerabilities. This option offers preliminary support for Intel® CET.

Syntax

Linux OS:

`-fcf-protection[=keyword]`

macOS:

None

Windows OS:

`/Qcf-protection[:keyword]`

Arguments

keyword	Specifies the level of protection the compiler should perform. Possible values are:	
	`shadow_stack`	Enables shadow stack protection.
	`branch_tracking`	Enables endbranch (EB) generation.
	`full`	Enables both shadow stack protection and EB generation. This is the same as specifying this compiler option with no *keyword*.
	`none`	Disables Intel® CET protection.

Default

`-fcf-protection=none` or `/Qcf-protection:none`	No Control-flow Enforcement protection is performed.

Description

This option enables Intel® CET protection, which defends your program from certain attacks that exploit vulnerabilities.

Intel® CET protections are enforced on processors that support Intel® CET. They are ignored on processors that do not support Intel® CET, so they are safe to use in programs that might run on a variety of processors.

Specifying `shadow_stack` helps to protect your program from return-oriented programming (ROP). Return-oriented programming (ROP) is a technique to exploit computer security defenses such as non-executable memory and code signing by gaining control of the call stack to modify program control flow and then execute certain machine instruction sequences.

Specifying `branch_tracking` helps to protect your program from call/jump-oriented programming (COP/JOP). Jump-oriented programming (JOP) is a variant of ROP that uses indirect jumps and calls to emulate return instructions. Call-oriented programming (COP) is a variant of ROP that employs indirect calls.

To get both protections, specify this compiler option with no *keyword*, or specify `-fcf-protection=full` (Linux*) or `/Qcf-protection:full` (Windows*).

IDE Equivalent

None

Alternate Options

Linux and macOS: `-qcf-protection`

Windows: None

fdata-sections, Gw

Places each data item in its own COMDAT section.

Syntax

Linux OS:

`-fdata-sections`

macOS:

`-fdata-sections`

Windows OS:

`/Gw`

Arguments

None

Default

OFF	The compiler does not separate functions into COMDATs.

Description

This option places each data item in its own COMDAT section.

When using this compiler option, you can add the linker option `-Wl,--gc-sections` (LInux) or `/link /OPT:REF` (Windows), which will remove all unused code.

> **NOTE**
> When you put each data item in its own section, it enables the linker to reorder the sections for other possible optimization.

Alternate Options

None

See Also

`ffunction-sections, Gy` compiler option

fexceptions

Enables exception handling table generation.

Syntax

Linux OS:

`-fexceptions`

`-fno-exceptions`

macOS:

`-fexceptions`

`-fno-exceptions`

Windows OS:

None

Arguments

None

Default

-fexceptions	Exception handling table generation is enabled. Default for C++.
-fno-exceptions	Exception handling table generation is disabled. Default for C.

Description

This option enables exception handling table generation. The `-fno-exceptions` option disables exception handling table generation, resulting in smaller code. When this option is used, any use of exception handling constructs (such as try blocks and throw statements) will produce an error. Exception specifications are parsed but ignored. It also undefines the preprocessor symbol __EXCEPTIONS.

IDE Equivalent

None

Alternate Options

None

ffunction-sections, Gy

Places each function in its own COMDAT section.

Syntax

Linux OS:

`-ffunction-sections`

macOS:

`-ffunction-sections`

Windows OS:

`/Gy`

Arguments

None

Default

OFF	The compiler does not separate functions into COMDATs.

Description

This option places each function in its own COMDAT section.

When using this compiler option, you can add the linker option `-Wl,--gc-sections` (LInux) or `/link /OPT:REF` (Windows), which will remove all unused code.

> **NOTE**
> When you put each function in its own section, it enables the linker to reorder the sections for other possible optimization.

`fdata-sections, Gw` compiler option

fomit-frame-pointer, Oy

Determines whether EBP is used as a general-purpose register in optimizations.

Architecture Restrictions

Option `/Oy[-]` is only available on IA-32 architecture

Syntax

Linux OS:

`-fomit-frame-pointer`

`-fno-omit-frame-pointer`

macOS:

`-fomit-frame-pointer`

`-fno-omit-frame-pointer`

Windows OS:

`/Oy`

/Oy-

Arguments

None

Default

-fomit-frame-pointer or /Oy	EBP is used as a general-purpose register in optimizations. However, on Linux* and macOS systems, the default is -fno-omit-frame-pointer if option -O0 or -g is specified. On Windows* systems, the default is /Oy- if option /Od is specified.

Description

These options determine whether EBP is used as a general-purpose register in optimizations. Option -fomit-frame-pointer and option /Oy allows this use. Option -fno-omit-frame-pointer and option /Oy- disallows it.

Some debuggers expect EBP to be used as a stack frame pointer, and cannot produce a stack backtrace unless this is so. The -fno-omit-frame-pointer and the /Oy- option directs the compiler to generate code that maintains and uses EBP as a stack frame pointer for all functions so that a debugger can still produce a stack backtrace without doing the following:

- For -fno-omit-frame-pointer: turning off optimizations with -O0
- For /Oy-: turning off /O1, /O2, or /O3 optimizations

The -fno-omit-frame-pointer option is set when you specify option -O0 or the -g option. The -fomit-frame-pointer option is set when you specify option -O1, -O2, or -O3.

The /Oy option is set when you specify the /O1, /O2, or /O3 option. Option /Oy- is set when you specify the /Od option.

Using the -fno-omit-frame-pointer or /Oy- option reduces the number of available general-purpose registers by 1, and can result in slightly less efficient code.

NOTE
For Linux* systems:

There is currently an issue with GCC 3.2 exception handling. Therefore, the compiler ignores this option when GCC 3.2 is installed for C++ and exception handling is turned on (the default).

IDE Equivalent

Visual Studio: **Optimization > Omit Frame Pointers**

Eclipse: **Optimization > Provide Frame Pointer**

Xcode: **Optimization > Provide Frame Pointer**

Alternate Options

Linux and macOS: -fp (this is a deprecated option)

Windows: None

GR

Enables or disables C++ Run Time Type Information (RTTI).

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/GR`

/GR-

Arguments

None

Default

/GR	C++ Run Time Type Information (RTTI) is enabled.

Description

This option enables or disables C++ Run Time Type Information (RTTI).

To disable C++ Run Time Type Information (RTTI), specify option /GR-.

IDE Equivalent

Windows

Visual Studio: **Language > Enable Run-Time Type Information**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

guard

Enables the control flow protection mechanism.

Syntax

Linux OS:

None

macOS:

None

Windows OS:

/guard:*keyword*

Arguments

keyword Specifies the the control flow protection mechanism. Possible values are:

cf[-] Tells the compiler to analyze control flow of valid targets for indirect calls and to insert code to verify the targets at runtime.

To explicitly disable this option, specify /guard:cf-.

Default

`OFF`	The control flow protection mechanism is disabled.

Description

This option enables the control flow protection mechanism. It tells the compiler to analyze control flow of valid targets for indirect calls and inserts a call to a checking routine before each indirect call to verify the target of the given indirect call.

The `/guard:cf` option must be passed to both the compiler and linker.

Code compiled using `/guard:cf` can be linked to libraries and object files that are not compiled using the option.

This option has been added for Microsoft compatibility. It uses the Microsoft implementation.

IDE Equivalent

Windows

Visual Studio: **Code Generation > Control Flow Guard**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

Gv

Tells the compiler to use the vector calling convention (__vectorcall) when passing vector type arguments.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Gv`

Arguments

None

Default

OFF	The default calling convention is `__cdecl`.

Description

This option tells the compiler to use the vector calling convention (__vectorcall) when passing vector type arguments.

It causes each function in the module to compile as __vectorcall unless the function is declared with a conflicting attribute, or the name of the function is main.

This option has been added for Microsoft compatibility.

For more details about the __vectorcall calling convention, see the Microsoft documentation.

IDE Equivalent

C C++ Calling Conventions

hotpatch

Tells the compiler to prepare a routine for hotpatching.

Syntax

Linux OS:

`-hotpatch[=n]`

macOS:

`None`

Windows OS:

`/hotpatch[:n]`

Arguments

n	An integer specifying the number of bytes the compiler should add before the function entry point.

Default

OFF	The compiler does not prepare routines for hotpatching.

Description

This option tells the compiler to prepare a routine for hotpatching. The compiler inserts nop padding around function entry points so that the resulting image is hot patchable.

Specifically, the compiler adds nop bytes after each function entry point and enough nop bytes before the function entry point to fit a direct jump instruction on the target architecture.

If *n* is specified, it overrides the default number of bytes that the compiler adds before the function entry point.

IDE Equivalent

None

Alternate Options

None

m

Tells the compiler which features it may target, including which instruction sets it may generate.

Syntax

Linux OS and macOS:

`-m`*`code`*

Windows OS:

`None`

Arguments

code	Indicates to the compiler a feature set that it may target, including which instruction sets it may generate. Many of the following descriptions refer to Intel® Streaming SIMD Extensions (Intel® SSE) and Supplemental Streaming SIMD Extensions (SSSE). Possible values are:

`avx`	May generate Intel® Advanced Vector Extensions (Intel® AVX), SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.
`sse4.2`	May generate Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.
`sse4.1`	May generate Intel® SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.
`ssse3`	May generate SSSE3 instructions and Intel® SSE3, SSE2, and SSE instructions.
`sse3`	May generate Intel® SSE3, SSE2, and SSE instructions.
`sse2`	May generate Intel® SSE2 and SSE instructions. This value is only available on Linux systems.
`sse`	This option has been deprecated; it is now the same as specifying `ia32`.
`ia32`	Generates x86/x87 generic code that is compatible with IA-32 architecture. Disables any default extended instruction settings, and any previously set extended instruction settings. It also disables all feature-specific

optimizations and instructions. This value is only available on Linux* systems using IA-32 architecture.

This compiler option also supports many of the `-m` option settings available with gcc. For more information on gcc `-m` settings, see the gcc documentation.

Default

Linux* systems: `-msse2` macOS systems: `-mssse3`	For more information on the default values, see Arguments above.

Description

This option tells the compiler which features it may target, including which instruction sets it may generate.

Code generated with these options should execute on any compatible, non-Intel processor with support for the corresponding instruction set.

Options `-x` and `-m` are mutually exclusive. If both are specified, the compiler uses the last one specified and generates a warning.

Linux* systems: For compatibility with gcc, the compiler allows the following options but they have no effect. You will get a warning error, but the instructions associated with the name will not be generated. You should use the suggested replacement options.

gcc Compatibility Option (Linux*)	Suggested Replacement Option
`-mfma`	`-march=core-avx2`
`-mbmi`, `-mavx2`, `-mlzcnt`	`-march=core-avx2`
`-mmovbe`	`-march=atom -minstruction=movbe`
`-mcrc32`, `-maes`, `-mpclmul`, `-mpopcnt`	`-march=corei7`
`-mvzeroupper`	`-march=corei7-avx`
`-mfsgsbase`, `-mrdrnd`, `-mf16c`	`-march=core-avx-i`

IDE Equivalent

None

Alternate Options

Linux and macOS: None

Windows: `/arch`

`m32, m64` compiler option

m32, m64, Qm32, Qm64

Tells the compiler to generate code for a specific architecture.

Syntax

Linux OS:

`-m32`

`-m64`

macOS:

`-m64`

Windows OS:

`/Qm32`

`/Qm64`

Arguments

None

Default

OFF	The compiler's behavior depends on the host system.

Description

These options tell the compiler to generate code for a specific architecture.

Option	Description
`-m32` or `/Qm32`	Tells the compiler to generate code for IA-32 architecture.
`-m64` or `/Qm64`	Tells the compiler to generate code for Intel® 64 architecture.

The `-m64` option is the same as macOS option `-arch x86_64`. This option is not related to the Intel®C++ Compiler option `arch`.

On Linux* systems, these options are provided for compatibility with gcc.

IDE Equivalent

None

Alternate Options

None

m80387

Specifies whether the compiler can use x87 instructions.

Syntax

Linux OS:

`-m80387`

`-mno-80387`

macOS:

`-m80387`

`-mno-80387`

Windows OS:

`None`

Arguments

None

Default

`-m80387`	The compiler may use x87 instructions.

Description

This option specifies whether the compiler can use x87 instructions.

If you specify option `-mno-80387`, it prevents the compiler from using x87 instructions. If the compiler is forced to generate x87 instructions, it issues an error message.

IDE Equivalent

None

Alternate Options

-m[no-]x87

march

Tells the compiler to generate code for processors that support certain features.

Syntax

Linux OS:

`-march=`*`processor`*

macOS:

`-march=`*`processor`*

Windows OS:

`None`

Arguments

processor	Tells the compiler the code it can generate. Possible values are:

`alderlake`
`amberlake`
`broadwell`
`cannonlake`
`cascadelake`
`coffeelake`
`cooperlake`
`goldmont`
`goldmont-plus`
`haswell`
`icelake-client` (or `icelake`)
`icelake-server`
`ivybridge`
`kabylake`
`knl`
`knm`
`rocketlake`
`sandybridge`
`sapphirerapids`
`silvermont`
`skylake`
`skylake-avx512`
`tigerlake`
`tremont`
`whiskeylake`
	May generate instructions for processors that support the specified Intel® processor or microarchitecture code name.
	Keywords `knl` and `silvermont` are only available on Linux* systems.
	Keyword `icelake` is deprecated and may be removed in a future release.

`core-avx2`	Generates code for processors that support Intel® Advanced Vector Extensions 2 (Intel® AVX2), Intel® AVX, SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.
`core-avx-i`	Generates code for processors that support Float-16 conversion instructions and the RDRND instruction, Intel® Advanced Vector Extensions (Intel® AVX), Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.
`corei7-avx`	Generates code for processors that support Intel® Advanced Vector Extensions (Intel® AVX), Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.
`corei7`	Generates code for processors that support Intel® SSE4 Efficient Accelerated String and Text Processing instructions. May also generate code for Intel® SSE4 Vectorizing Compiler and Media Accelerator, Intel® SSE3, SSE2, SSE, and SSSE3 instructions.

`atom`	Generates code for processors that support MOVBE instructions, depending on the setting of option `-minstruction` (Linux* and macOS) or `/Qinstruction` (Windows*). May also generate code for SSSE3 instructions and Intel® SSE3, SSE2, and SSE instructions.
`core2`	Generates code for the Intel® Core™2 processor family.
`pentium4m`	Generates for Intel® Pentium® 4 processors with MMX technology.

`pentium-m`
`pentium4`
`pentium3`
`pentium`
	Generates code for Intel® Pentium® processors. Value `pentium3` is only available on Linux* systems.

Default

`pentium4`	If no architecture option is specified, value `pentium4` is used by the compiler to generate code.

Description

This option tells the compiler to generate code for processors that support certain features.

If you specify both the `-ax` and `-march` options, the compiler will not generate Intel-specific instructions.

Specifying `-march=pentium4` sets `-mtune=pentium4`.

For compatibility, a number of historical *processor* values are also supported, but the generated code will not differ from the default.

masm

Tells the compiler to generate the assembler output file using a selected dialect.

Syntax

Linux OS:

`-masm=`*`dialect`*

macOS:

None

Windows OS:

None

Arguments

dialect	Is the dialect to use for the assembler output file. Possible values are:	
	`att`	Tells the compiler to generate the assembler output file using AT&T* syntax.
	`intel`	Tells the compiler to generate the assembler output file using Intel syntax.

Default

`-masm=att`	The compiler generates the assembler output file using AT&T* syntax.

Description

This option tells the compiler to generate the assembler output file using a selected dialect.

IDE Equivalent

None

Alternate Options

None

mauto-arch, Qauto-arch

Tells the compiler to generate multiple, feature-specific auto-dispatch code paths for x86 architecture processors if there is a performance benefit.

Syntax

Linux OS and macOS:

`-mauto-arch=value`

Windows OS:

`/Qauto-arch:value`

Arguments

value	Is any setting you can specify for option `[Q]ax`.

Default

OFF	No additional execution path is generated.

Description

This option tells the compiler to generate multiple, feature-specific auto-dispatch code paths for x86 architecture processors if there is a performance benefit. It also generates a baseline code path.

This option cannot be used together with any options that may require Intel-specific optimizations (such as `[Q]x` or `[Q]ax`).

IDE Equivalent

None

Alternate Options

None

`ax, Qax` compiler option

mbranches-within-32B-boundaries, Qbranches-within-32B-boundaries

Tells the compiler to align branches and fused branches on 32-byte boundaries for better performance.

Syntax

Linux OS:

`-mbranches-within-32B-boundaries`

`-mno-branches-within-32B-boundaries`

macOS:

`-mbranches-within-32B-boundaries`

`-mno-branches-within-32B-boundaries`

Windows OS:

`/Qbranches-within-32B-boundaries`

`/Qbranches-within-32B-boundaries-`

Arguments

None

Default

`-mno-branches-within-32B-boundaries` or `/Qbranches-within-32B-boundaries-`	Branches and fused branches are not aligned on 32-byte boundaries.

Description

This option tells the compiler to align branches and fused branches on 32-byte boundaries for better performance.

> **NOTE**
> When you use this option, it may affect binary utilities usage experience, such as debugability.

IDE Equivalent

None

Alternate Options

None

mconditional-branch, Qconditional-branch

Lets you identify and fix code that may be vulnerable to speculative execution side-channel attacks, which can leak your secure data as a result of bad speculation of a conditional branch direction.

Syntax

Linux OS:

`-mconditional-branch=`*`keyword`*

macOS:

`-mconditional-branch=`*`keyword`*

Windows OS:

`/Qconditional-branch:`*`keyword`*

Arguments

`keyword` Indicates to the compiler what action to take. Possible values are:

`keep`	Tells the compiler to not attempt any vulnerable code detection or fixing. This is equivalent to not specifying the `-mconditional-branch` option.

`pattern-report`	Tells the compiler to perform a search of vulnerable code patterns in the compilation and report all occurrences to stderr.
`pattern-fix`	Tells the compiler to perform a search of vulnerable code patterns in the compilation and generate code to ensure that the identified data accesses are not executed speculatively. It will also report any fixed patterns to stderr. This setting does not guarantee total mitigation, it only fixes cases where all components of the vulnerability can be seen or determined by the compiler. The pattern detection will be more complete if advanced optimization options are specified or are in effect, such as option `O3` and option `-ipo` (or `/Qipo`).
`all-fix`	Tells the compiler to fix all of the vulnerable code so that it is either not executed speculatively, or there is no observable side-channel created from their speculative execution. Since it is a complete mitigation against Spectre variant 1 attacks, this setting will have the most run-time performance cost. In contrast to the `pattern-fix` setting, the compiler will not attempt to identify the exact conditional branches that may have led to the mis-speculated execution.
`all-fix-lfence`	This is the same as specifying setting `all-fix`.
`all-fix-cmov`	Tells the compiler to treat any path where speculative execution of a memory load creates vulnerability (if mispredicted). The compiler automatically adds mitigation code along any vulnerable paths found, but it uses a different method then the one used for `all-fix` (or `all-fix-lfence`). This method uses CMOVcc instruction execution, which constrains speculative execution. Thus, it is used for keeping track of the predicate value, which is updated on each conditional branch. To prevent Spectre v.1 attack, each memory load that is potentially vulnerable is bitwise ORed with the predicate to mask out the loaded value if the code is on a mispredicted path. This is analogous to the Clang compiler's option to do Speculative Load Hardening. This setting is only supported on Intel® 64 architecture-based systems.

Default

`-mconditional-branch=keep` and `/Qconditional-branch:keep`	The compiler does not attempt any vulnerable code detection or fixing.

Description

This option lets you identify code that may be vulnerable to speculative execution side-channel attacks, which can leak your secure data as a result of bad speculation of a conditional branch direction. Depending on the setting you choose, vulnerabilities may be detected and code may be generated to attempt to mitigate the security risk.

IDE Equivalent

Visual Studio: **Code Generation [Intel C++] > Spectre Variant 1 Mitigation**

Eclipse: None

Xcode: None

Alternate Options

None

minstruction, Qinstruction

Determines whether MOVBE instructions are generated for certain Intel processors.

Syntax

Linux OS and macOS:

`-minstruction=[no]movbe`

Windows OS:

`/Qinstruction:[no]movbe`

Arguments

None

Default

`-minstruction=nomovbe` or `/Qinstruction:nomovbe`	The compiler does not generate MOVBE instructions for Intel Atom® processors.

Description

This option determines whether MOVBE instructions are generated for Intel Atom® processors. To use this option, you must also specify `[Q]xATOM_SSSE3` or `[Q]xATOM_SSE4.2`.

If `-minstruction=movbe` or `/Qinstruction:movbe` is specified, the following occurs:

- MOVBE instructions are generated that are specific to the Intel Atom® processor.
- Generated executables can only be run on Intel Atom® processors or processors that support Supplemental Streaming SIMD Extensions 3 (Intel® SSSE3) or Intel® Streaming SIMD Extensions 4.2 (Intel® SSE4.2) and MOVBE.

If `-minstruction=nomovbe` or `/Qinstruction:nomovbe` is specified, the following occurs:

- The compiler optimizes code for the Intel Atom® processor, but it does not generate MOVBE instructions.
- Generated executables can be run on non-Intel Atom® processors that support Intel® SSE3 or Intel® SSE4.2.

IDE Equivalent

None

Alternate Options

x, Qx compiler option

momit-leaf-frame-pointer

Determines whether the frame pointer is omitted or kept in leaf functions.

Syntax

Linux OS:

`-momit-leaf-frame-pointer`

`-mno-omit-leaf-frame-pointer`

macOS:

`-momit-leaf-frame-pointer`

`-mno-omit-leaf-frame-pointer`

Windows OS:

None

Arguments

None

Default

Varies	If you specify option `-fomit-frame-pointer` (or it is set by default), the default is `-momit-leaf-frame-pointer`. If you specify option `-fno-omit-frame-pointer`, the default is `-mno-omit-leaf-frame-pointer`.

Description

This option determines whether the frame pointer is omitted or kept in leaf functions. It is related to option `-f[no-]omit-frame-pointer` and the setting for that option has an effect on this option.

Consider the following option combinations:

Option Combination	Result

`-fomit-frame-pointer -momit-leaf-frame-pointer`
or
`-fomit-frame-pointer -mno-omit-leaf-frame-pointer`
	Both combinations are the same as specifying `-fomit-frame-pointer`. Frame pointers are omitted for all routines.

`-fno-omit-frame-pointer -momit-leaf-frame-pointer`	In this case, the frame pointer is omitted for leaf routines, but other routines will keep the frame pointer.

Option Combination	Result
	This is the intended effect of option `-momit-leaf-frame-pointer`.
`-fno-omit-frame-pointer -mno-omit-leaf-frame-pointer`	In this case, `-mno-omit-leaf-frame-pointer` is ignored since `-fno-omit-frame-pointer` retains frame pointers in all routines . This combination is the same as specifying `-fno-omit-frame-pointer`.

This option is provided for compatibility with gcc.

IDE Equivalent

Visual Studio: None

Eclipse: **Optimization > Omit frame pointer for leaf routines**

Xcode: **Optimization > Provide Frame Pointer For Leaf Routines**

Alternate Options

None

fomit-frame-pointer, Oy compiler option

mregparm

Lets you control the number registers used to pass integer arguments.

Architecture Restrictions

Only available on IA-32 architecture

Syntax

Linux OS:

`-mregparm=`*n*

macOS:

`None`

Windows OS:

`None`

Arguments

n	Specifies the number of registers to use when passing integer arguments. You can specify at most 3 registers. If you specify a nonzero value for *n*, you must build all modules, including startup modules, and all libraries, including system libraries, with the same value.

Default

OFF	The compiler does not use registers to pass arguments.

Description

Control the number registers used to pass integer arguments. This option is provided for compatibility with gcc.

IDE Equivalent

None

Alternate Options

None

See Also

`mregparm-version` compiler option

mregparm-version

Determines which version of the Application Binary Interface (ABI) is used for the regparm parameter passing convention.

Syntax

Linux OS:

`-mregparm-version=n`

macOS:

macOS:

None

Windows OS:

None

Arguments

n	Specifies the ABI implementation to use. Possible values are:	
	0	Tells the compiler to use the most recent ABI implementation.
	1	Tells the compiler to use the ABI implementation that is compatible with gcc 3.4.6 and icc 15.0.

Default

0	The compiler uses the most recent ABI implementation.

Description

This option determines which version of the Application Binary Interface (ABI) is used for the regparm parameter passing convention. This option allows compatibility with previous versions of gcc and icc.

IDE Equivalent

None

Alternate Options

None

`mregparm` compiler option

mstringop-inline-threshold, Qstringop-inline-threshold

Tells the compiler to not inline calls to buffer manipulation functions such as memcpy and memset when the number of bytes the functions handle are known at compile time and greater than the specified value.

Syntax

Linux OS:

`-mstringop-inline-threshold=`*`val`*

macOS:

`-mstringop-inline-threshold=`*`val`*

Windows OS:

`/Qstringop-inline-threshold:`*`val`*

Arguments

val	Is a positive 32-bit integer. If the size is greater than *val*, the compiler will never inline it.

Default

OFF	The compiler uses its own heuristics to determine the default.

Description

This option tells the compiler to not inline calls to buffer manipulation functions such as memcpy and memset when the number of bytes the functions handle are known at compile time and greater than the specified *val*.

IDE Equivalent

None

Alternate Options

None

See Also

mstringop-strategy, Qstringop-strategy compiler option

mstringop-strategy, Qstringop-strategy

Lets you override the internal decision heuristic for the particular algorithm used when implementing buffer manipulation functions such as memcpy and memset.

Syntax

Linux OS and macOS:

`-mstringop-strategy=`*`alg`*

Windows OS:

`/Qstringop-strategy:`*`alg`*

Arguments

`alg`	Specifies the algorithm to use. Possible values are:	
	`const_size_loop`	Tells the compiler to expand the string operations into an inline loop when the size is known at compile time and it is not greater than threshold value. Otherwise, the compiler uses its own heuristics to decide how to implement the string operation.
	`libcall`	Tells the compiler to use a library call when implementing string operations.
	`rep`	Tells the compiler to use its own heuristics to decide what form of `rep movs	stos` to use when inlining string operations.

Default

varies	If optimization option `Os` is specified, the default is `rep`. Otherwise, the default is `const_size_loop`.

Description

This option lets you override the internal decision heuristic for the particular algorithm used when implementing buffer manipulation functions such as memcpy and memset.

This option may have no effect on compiler-generated string functions, for example, a call to memcpy generated by the compiler to implement an array copy or structure copy.

IDE Equivalent

None

Alternate Options

None

mstringop-inline-threshold, Qstringop-inline-threshold compiler option
Os compiler option

mtune, tune

Performs optimizations for specific processors but does not cause extended instruction sets to be used (unlike -march).

Syntax

Linux OS:

`-mtune=`*`processor`*

macOS:

`-mtune=`*`processor`*

Windows OS:

`/tune:`*`processor`*

Arguments

processor — Is the processor for which the compiler should perform optimizations. Possible values are:

`generic`	Optimizes code for the compiler's default behavior.

`alderlake`
`amberlake`
`broadwell`
`cannonlake`
`cascadelake`
`coffeelake`
`cooperlake`
`goldmont`
`goldmont-plus`
`haswell`
`icelake-client` (or `icelake`)
`icelake-server`
`ivybridge`
`kabylake`
`knl`
`knm`
`rocketlake`
`sandybridge`
`sapphirerapids`
`silvermont`
`skylake`
`skylake-avx512`
`tigerlake`
`tremont`
`whiskeylake`
	Optimizes code for processors that support the specified Intel® processor or microarchitecture code name.
	Keywords `knl` and `silvermont` are only available on Windows* and Linux* systems.
	Keyword `icelake` is deprecated and may be removed in a future release.

`core-avx2`	Optimizes code for processors that support Intel® Advanced Vector Extensions 2 (Intel® AVX2), Intel® AVX, SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.
`core-avx-i`	Optimizes code for processors that support Float-16 conversion instructions and the RDRND instruction, Intel® Advanced Vector Extensions (Intel® AVX), Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.
`corei7-avx`	Optimizes code for processors that support Intel® Advanced Vector Extensions (Intel® AVX), Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions.
`corei7`	Optimizes code for processors that support Intel® SSE4 Efficient Accelerated String and Text Processing instructions. May also generate code for Intel® SSE4 Vectorizing Compiler and Media Accelerator, Intel® SSE3, SSE2, SSE, and SSSE3 instructions.
`atom`	Optimizes code for processors that support MOVBE instructions, depending on the setting of option `-minstruction` (Linux* and macOS) or `/Qinstruction` (Windows*). May also generate code for SSSE3 instructions and Intel® SSE3, SSE2, and SSE instructions.
`core2`	Optimizes for the Intel® Core™2 processor family, including support for MMX™, Intel® SSE, SSE2, SSE3 and SSSE3 instruction sets.
`pentium-mmx`	Optimizes for Intel® Pentium® with MMX technology.
`pentiumpro`	Optimizes for Intel® Pentium® Pro, Intel Pentium II, and Intel Pentium III processors.
`pentium4m`	Optimizes for Intel® Pentium® 4 processors with MMX technology.

`pentium-m`
`pentium4`
`pentium3`
`pentium`
	Optimizes code for Intel® Pentium® processors. Value `pentium3` is only available on Linux* systems.

Default

generic	Code is generated for the compiler's default behavior.

Description

This option performs optimizations for specific processors but does not cause extended instruction sets to be used (unlike `-march`).

The resulting executable is backwards compatible and generated code is optimized for specific processors. For example, code generated with `-mtune=core2` or `/tune:core2` will run correctly on 4th Generation Intel® Core™ processors, but it might not run as fast as if it had been generated using `-mtune=haswell` or `/tune:haswell`. Code generated with `-mtune=haswell` (`/tune:haswell`) or `-mtune=core-avx2` (`/tune:core-avx2`) will also run correctly on Intel® Core™2 processors, but it might not run as fast as if it had been generated using `-mtune=core2` or `/tune:core2`. This is in contrast to code generated with `-march=core-avx2` or `/arch:core-avx2`, which will not run correctly on older processors such as Intel® Core™2 processors.

`march` compiler option

Qcxx-features

Enables standard C++ features without disabling Microsoft features.*

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Qcxx-features`

Arguments

None

Default

OFF	The compiler enables standard C++ features.

Description

This option enables standard C++ features without disabling Microsoft* features within the bounds of what is provided in the Microsoft headers and libraries.

This option has the same effect as specifying `/EHsc /GR`.

IDE Equivalent

None

Alternate Options

None

Qpatchable-addresses

Tells the compiler to generate code such that references to statically assigned addresses can be patched.

Architecture Restrictions

Only available on Intel® 64 architecture

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Qpatchable-addresses`

Arguments

None

Default

OFF	The compiler does not generate patchable addresses.

Description

This option tells the compiler to generate code such that references to statically assigned addresses can be patched with arbitrary 64-bit addresses.

Normally, the Windows* system compiler that runs on Intel® 64 architecture uses 32-bit relative addressing to reference statically allocated code and data. That assumes the code or data is within 2GB of the access point, an assumption that is enforced by the Windows object format.

However, in some patching systems, it is useful to have the ability to replace a global address with some other arbitrary 64-bit address, one that might not be within 2GB of the access point.

This option causes the compiler to avoid 32-bit relative addressing in favor of 64-bit direct addressing so that the addresses can be patched in place without additional code modifications. This option causes code size to increase, and since 32-bit relative addressing is usually more efficient than 64-bit direct addressing, you may see a performance impact.

IDE Equivalent

None

Alternate Options

None

Qsafeseh

Registers exception handlers for safe exception handling.

Architecture Restrictions

Only available on IA-32 architecture

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Qsafeseh[-]`

Arguments

None

Default

ON	Exception handlers are enabled for safe exception handling.

Description

Registers exception handlers for safe exception handling. It also marks objects as "compatible with the Registered Exception Handling feature" whether they contain handlers or not. This is important because the Windows linker will only generate the "special registered EH table" if ALL objects that it is building into an image are marked as compatible. If any objects are not marked as compatible, the EH table is not generated.

Digital signatures certify security and are required for components that are shipped with Windows, such as device drivers.

IDE Equivalent

None

Alternate Options

`/EH` compiler option

regcall, Qregcall

Tells the compiler that the __regcall calling convention should be used for functions that do not directly specify a calling convention.

Syntax

Linux OS:

`-regcall`

macOS:

`-regcall`

Windows OS:

`/Qregcall`

Arguments

None

Default

OFF	The __regcall calling convention will only be used if a function explicitly specifies it.

Description

This option tells the compiler that the __regcall calling convention should be used for functions that do not directly specify a calling convention. This calling convention ensures that as many values as possible are passed or returned in registers.

It ensures that __regcall is the default calling convention for functions in the compilation, unless another calling convention is specified in a declaration.

This calling convention is ignored if it is specified for a function with variable arguments.

Note that all __regcall functions must have prototypes.

IDE Equivalent

None

Alternate Options

C/C++ Calling Conventions

x, Qx

Tells the compiler which processor features it may target, including which instruction sets and optimizations it may generate.

Syntax

Linux OS:

`-x`*code*

macOS:

`-x`*code*

Windows OS:

`/Qx`*code*

Arguments

code	Specifies a feature set that the compiler can target, including which instruction sets and optimizations it may generate. Many of the following descriptions refer to Intel® Streaming SIMD Extensions (Intel® SSE) and Supplemental Streaming SIMD Extensions (Intel® SSSE). Possible values are:

`ALDERLAKE`
`AMBERLAKE`
`BROADWELL`
`CANNONLAKE`
`CASCADELAKE`
`COFFEELAKE`
`COOPERLAKE`
`GOLDMONT`
`GOLDMONT-PLUS`
`HASWELL`
`ICELAKE-CLIENT` (or `ICELAKE`)
`ICELAKE-SERVER`
`IVYBRIDGE`
`KABYLAKE`
`KNL`
`KNM`
`ROCKETLAKE`
`SANDYBRIDGE`
`SAPPHIRERAPIDS`
`SILVERMONT`
`SKYLAKE`
`SKYLAKE-AVX512`
`TIGERLAKE`
`TREMONT`
`WHISKEYLAKE`
	May generate instructions for processors that support the specified Intel® processor or microarchitecture code name. Optimizes for the specified Intel® processor or microarchitecture code name.
	
	Keywords `KNL` and `SILVERMONT` are only available on Windows* and Linux* systems.
	
	Keyword `ICELAKE` is deprecated and may be removed in a future release.

`COMMON-AVX512`	May generate Intel® Advanced Vector Extensions 512 (Intel® AVX-512) Foundation instructions, Intel® AVX-512 Conflict Detection Instructions (CDI), as well as the instructions enabled with CORE-AVX2. Optimizes for Intel® processors that support Intel® AVX-512 instructions.
`CORE-AVX512`	May generate Intel® Advanced Vector Extensions 512 (Intel® AVX-512) Foundation instructions, Intel® AVX-512 Conflict Detection Instructions (CDI), Intel® AVX-512

	Doubleword and Quadword Instructions (DQI), Intel® AVX-512 Byte and Word Instructions (BWI) and Intel® AVX-512 Vector Length extensions, as well as the instructions enabled with CORE-AVX2. Optimizes for Intel® processors that support Intel® AVX-512 instructions.
CORE-AVX2	May generate Intel® Advanced Vector Extensions 2 (Intel® AVX2), Intel® AVX, SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions for Intel® processors. Optimizes for Intel® processors that support Intel® AVX2 instructions.
CORE-AVX-I	May generate Float-16 conversion instructions and the RDRND instruction, Intel® Advanced Vector Extensions (Intel® AVX), Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions for Intel® processors. Optimizes for Intel® processors that support Float-16 conversion instructions and the RDRND instruction.
AVX	May generate Intel® Advanced Vector Extensions (Intel® AVX), Intel® SSE4.2, SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions for Intel® processors. Optimizes for Intel processors that support Intel® AVX instructions.
SSE4.2	May generate Intel® SSE4 Efficient Accelerated String and Text Processing instructions, Intel® SSE4 Vectorizing Compiler and Media Accelerator, and Intel® SSE3, SSE2, SSE, and SSSE3 instructions for Intel® processors. Optimizes for Intel processors that support Intel® SSE4.2 instructions.
SSE4.1	May generate Intel® SSE4 Vectorizing Compiler and Media Accelerator instructions for Intel® processors. May generate Intel® SSE4.1, SSE3, SSE2, SSE, and SSSE3 instructions for Intel processors that support Intel® SSE4.1 instructions.
ATOM_SSE4.2	May generate MOVBE instructions for Intel® processors, depending on the setting of option `-minstruction` (Linux* and macOS) or `/Qinstruction` (Windows*). May also generate Intel® SSE4.2, SSE3, SSE2, and SSE instructions for Intel processors. Optimizes for Intel Atom® processors that support Intel® SSE4.2 and MOVBE instructions. This keyword is only available on Windows* and Linux* systems.
ATOM_SSSE3	May generate MOVBE instructions for Intel® processors, depending on the setting of option `-minstruction` (Linux* and macOS) or `/Qinstruction` (Windows*). May also generate SSSE3, Intel® SSE3, SSE2, and SSE instructions for Intel processors. Optimizes for Intel Atom® processors that support Intel® SSE3 and MOVBE instructions. This keyword is only available on Windows* and Linux* systems.

`SSSE3`	May generate SSSE3 and Intel® SSE3, SSE2, and SSE instructions for Intel® processors. Optimizes for Intel processors that support SSSE3 instructions. For macOS systems, this value is only supported on Intel® 64 architecture. This replaces value T, which is deprecated.
`SSE3`	May generate Intel® SSE3, SSE2, and SSE instructions for Intel® processors. Optimizes for Intel processors that support Intel® SSE3 instructions. This value is not available on macOS systems.
`SSE2`	May generate Intel® SSE2 and SSE instructions for Intel® processors. Optimizes for Intel processors that support Intel® SSE2 instructions. This value is not available on macOS systems.

You can also specify a `Host`. For more information, see option [Q]xHost.

Default

Windows* systems: None Linux* systems: None macOS systems: `SSSE3`	On Windows systems, if neither `/Qx` nor `/arch` is specified, the default is `/arch:SSE2`. On Linux systems, if neither `-x` nor `-m` is specified, the default is `-msse2`.

Description

This option tells the compiler which processor features it may target, including which instruction sets and optimizations it may generate. It also enables optimizations in addition to Intel feature-specific optimizations.

The specialized code generated by this option may only run on a subset of Intel® processors.

The resulting executables created from these option *code* values can only be run on Intel® processors that support the indicated instruction set.

The binaries produced by these *code* values will run on Intel® processors that support the specified features.

Do not use *code* values to create binaries that will execute on a processor that is not compatible with the targeted processor. The resulting program may fail with an illegal instruction exception or display other unexpected behavior.

Compiling the function main() with any of the *code* values produces binaries that display a fatal run-time error if they are executed on unsupported processors, including all non-Intel processors.

Compiler options `m` and `arch` produce binaries that should run on processors not made by Intel that implement the same capabilities as the corresponding Intel® processors.

The `-x` and `/Qx` options enable additional optimizations not enabled with options `-m` or `/arch` (nor with options `-ax` and `/Qax`).

On Windows systems, options `/Qx` and /arch are mutually exclusive. If both are specified, the compiler uses the last one specified and generates a warning. Similarly, on Linux and macOS systems, options `-x` and `-m` are mutually exclusive. If both are specified, the compiler uses the last one specified and generates a warning.

NOTE
All settings except SSE2 do a CPU check. However, if you specify option -O0 (Linux* and macOS) or option /Od (Windows*), no CPU check is performed.

xHost, QxHost

Tells the compiler to generate instructions for the highest instruction set available on the compilation host processor.

Syntax

Linux OS and macOS:

`-xHost`

Windows OS:

`/QxHost`

Arguments

None

Default

Windows* systems: None Linux* systems: None macOS systems: `-xSSSE3`	On Windows systems, if neither `/Qx` nor `/arch` is specified, the default is `/arch:SSE2`. On Linux systems, if neither `-x` nor `-m` is specified, the default is `-msse2`.

Description

This option tells the compiler to generate instructions for the highest instruction set available on the compilation host processor.

The instructions generated by this compiler option differ depending on the compilation host processor.

The following table describes the effects of specifying the `[Q]xHost` option and it tells whether the resulting executable will run on processors different from the host processor.

Descriptions in the table refer to Intel® Advanced Vector Extensions 2 (Intel® AVX2), Intel® Advanced Vector Extensions (Intel® AVX), Intel® Streaming SIMD Extensions (Intel® SSE), and Supplemental Streaming SIMD Extensions (SSSE).

Instruction Set of Host Processor	Effects When the -xHost or /QxHost Compiler Option is Specified
Intel® AVX2	When compiling on Intel® processors: Corresponds to option `[Q]xCORE-AVX2`. The generated executable will not run on non-Intel processors and it will not run on Intel® processors that do not support Intel® AVX2 instructions. When compiling on non-Intel processors: Corresponds to option `-march=core-avx2` (Linux* and macOS) or `/arch:CORE-AVX2` (Windows*). The generated executable will run on Intel® processors and non-Intel processors that support at least Intel® AVX2 instructions.. You may see a run-time error if the run-time processor does not support Intel® AVX2 instructions.
Intel® AVX	When compiling on Intel® processors: Corresponds to option `[Q]xAVX`. The generated executable will not run on non-Intel processors and it will not run on Intel® processors that do not support Intel® AVX instructions. When compiling on non-Intel processors: Corresponds to option `-mavx` (Linux and macOS) or `/arch:AVX` (Windows). The generated executable will run on Intel® processors and non-Intel processors that support at least Intel® AVX instructions. You may see a run-time error if the run-time processor does not support Intel® AVX instructions.
Intel® SSE4.2	When compiling on Intel® processors: Corresponds to option `[Q]xSSE4.2`. The generated executable will not run on non-Intel processors and it will not run on Intel® processors that do not support Intel® SSE4.2 instructions. When compiling on non-Intel processors:

Instruction Set of Host Processor	Effects When the -xHost or /QxHost Compiler Option is Specified
	Corresponds to option `-msse4.2` (Linux and macOS) or `/arch:SSE4.2` (Windows). The generated executable will run on Intel® processors and non-Intel processors that support at least Intel® SSE4.2 instructions. You may see a run-time error if the run-time processor does not support Intel® SSE4.2 instructions.
Intel® SSE4.1	When compiling on Intel® processors: Corresponds to option `[Q]xSSE4.1`. The generated executable will not run on non-Intel processors and it will not run on Intel® processors that do not support Intel® SSE4.1 instructions. When compiling on non-Intel processors: Corresponds to option `-msse4.1` (Linux and macOS) or `/arch:SSE4.1` (Windows). The generated executable will run on Intel® processors and non-Intel processors that support at least Intel® SSE4.1 instructions. You may see a run-time error if the run-time processor does not support Intel® SSE4.1 instructions.
SSSE3	When compiling on Intel® processors: Corresponds to option `[Q]xSSSE3`. The generated executable will not run on non-Intel processors and it will not run on Intel® processors that do not support SSSE3 instructions. When compiling on non-Intel processors: Corresponds to option `-mssse3` (Linux and macOS) or `/arch:SSSE3` (Windows). The generated executable will run on Intel® processors and non-Intel processors that support at least SSSE3 instructions. You may see a run-time error if the run-time processor does not support SSSE3 instructions.
Intel® SSE3	When compiling on Intel® processors: Corresponds to option `[Q]xSSE3`. The generated executable will not run on non-Intel processors and it will not run on Intel® processors that do not support Intel® SSE3 instructions. When compiling on non-Intel processors: Corresponds to option `-msse3` (Linux and macOS) or `/arch:SSE3` (Windows). The generated executable will run on Intel® processors and non-Intel processors that support at least Intel® SSE3 instructions. You may see a warning run-time error if the run-time processor does not support Intel® SSE3 instructions.
Intel® SSE2	When compiling on Intel® processors or non-Intel processors: Corresponds to option `-msse2` (Linux and macOS) or `/arch:SSE2` (Windows). The generated executable will run on Intel® processors and non-Intel processors that support at least Intel® SSE2 instructions. You may see a run-time error if the run-time processor does not support Intel® SSE2 instructions.

For more information on other settings for option `[Q]x`, see that option description.

Interprocedural Optimization Options

This section contains descriptions for compiler options that pertain to interprocedural optimization.

ffat-lto-objects

Determines whether a fat link-time optimization (LTO) object, containing both intermediate language and object code, is generated during an interprocedural optimization compilation (-c –ipo).

Syntax

Linux OS:

`-ffat-lto-objects`

`-fno-fat-lto-objects`

macOS:

`None`

Windows OS:

`None`

Arguments

None

Default

`-ffat-lto-objects`	When `-c -ipo` is specified, the compiler generates a fat link-time optimization (LTO) object that has both a true object and a discardable intermediate language section.

Description

This option determines whether a fat link time optimization (LTO) object, containing both intermediate language and object code, is generated during an interprocedural optimization compilation (`-c -ipo`).

During an interprocedural optimization compilation (`-c -ipo`), the following occurs:

- If you specify `-ffat-lto-objects`, the compiler generates a fat link-time optimization (LTO) object that has both a true object and a discardable intermediate language section. This enables both link-time optimization (LTO) linking and normal linking.
- If you specify `-fno-fat-lto-objects`, the compiler generates a fat link-time optimization (LTO) object that only has a discardable intermediate language section; no true object is generated. This option may improve compilation time.

Note that these files will be inserted into archives in the form in which they were created.

This option is provided for compatibility with gcc. For more information about this option, see the gcc documentation.

> **NOTE**
> Intel's intermediate language representation is not compatible with gcc's intermediate language representation.

IDE Equivalent

None

Alternate Options

None

See Also

`ipo, Qipo` compiler option

ip, Qip

Determines whether additional interprocedural optimizations for single-file compilation are enabled.

Syntax

Linux OS:

`-ip`

`-no-ip`

macOS:

`-ip`

`-no-ip`

Windows OS:

/Qip

/Qip-

Arguments

None

Default

OFF	Some limited interprocedural optimizations occur, including inline function expansion for calls to functions defined within the current source file. These optimizations are a subset of full intra-file interprocedural optimizations. Note that this setting is not the same as -no-ip (Linux* and macOS) or /Qip- (Windows*).

Description

This option determines whether additional interprocedural optimizations for single-file compilation are enabled.

The [Q]ip option enables additional interprocedural optimizations for single-file compilation.

Options -no-ip (Linux and macOS) and /Qip- (Windows) may not disable inlining. To ensure that inlining of user-defined functions is disabled, specify -inline-level=0or -fno-inline (Linux and macOS), or specify /Ob0 (Windows). To ensure that inliningof compiler intrinsic functions is disabled, specify -fno-builtin (Linux and macOS) or /Oi- (Windows).

IDE Equivalent

Windows

Visual Studio: **Optimization > Interprocedural Optimization**

Linux

Eclipse: **Optimization > Enable Interprocedural Optimizations for Single File Compilation**

OS X

Xcode: **Optimization > Enable Interprocedural Optimization for Single File Compilation**

Alternate Options

None

See Also

finline-functions compiler option

ip-no-inlining, Qip-no-inlining

Disables full and partial inlining enabled by interprocedural optimization options.

Syntax

Linux OS:

-ip-no-inlining

macOS:

`-ip-no-inlining`

Windows OS:

`/Qip-no-inlining`

Arguments

None

Default

OFF	Inlining enabled by interprocedural optimization options is performed.

Description

This option disables full and partial inlining enabled by the following interprocedural optimization options:

- On Linux* and macOS systems: `-ip` or `-ipo`
- On Windows* systems: `/Qip`, `/Qipo`, or `/Ob2`

It has no effect on other interprocedural optimizations.

On Windows systems, this option also has no effect on user-directed inlining specified by option `/Ob1`.

IDE Equivalent

None

Alternate Options

None

ip-no-pinlining, Qip-no-pinlining

Disables partial inlining enabled by interprocedural optimization options.

Syntax

Linux OS:

`-ip-no-pinlining`

macOS:

`-ip-no-pinlining`

Windows OS:

`/Qip-no-pinlining`

Arguments

None

Default

OFF	Inlining enabled by interprocedural optimization options is performed.

Description

This option disables partial inlining enabled by the following interprocedural optimization options:

- On Linux* and macOS systems: `-ip` or `-ipo`
- On Windows* systems: `/Qip` or `/Qipo`

It has no effect on other interprocedural optimizations.

IDE Equivalent

None

Alternate Options

None

ipo, Qipo

Enables interprocedural optimization between files.

Syntax

Linux OS:

`-ipo[n]`

`-no-ipo`

macOS:

`-ipo[n]`

`-no-ipo`

Windows OS:

`/Qipo[n]`

`/Qipo-`

Arguments

n	Is an optional integer that specifies the number of object files the compiler should create. The integer must be greater than or equal to 0.

Default

`-no-ipo` or `/Qipo-`	Multifile interprocedural optimization is not enabled.

Description

This option enables interprocedural optimization between files. This is also called multifile interprocedural optimization (multifile IPO) or Whole Program Optimization (WPO).

When you specify this option, the compiler performs inline function expansion for calls to functions defined in separate files.

You cannot specify the names for the files that are created.

If *n* is 0, the compiler decides whether to create one or more object files based on an estimate of the size of the application. It generates one object file for small applications, and two or more object files for large applications.

If *n* is greater than 0, the compiler generates *n* object files, unless *n* exceeds the number of source files (*m*), in which case the compiler generates only *m* object files.

If you do not specify *n*, the default is 0.

NOTE
When you specify option `[Q]ipo` with option `[q or Q]opt-report`, IPO information is generated in the compiler optimization report at link time. After linking, you will see a report named ipo_out.optrpt in the folder where you linked all of the object files.

IDE Equivalent

Windows

Visual Studio: **Optimization > Interprocedural Optimization**

Linux

Eclipse: **Optimization > Enable Whole Program Optimization**

OS X

Xcode: None

Alternate Options

None

ipo-c, Qipo-c

Tells the compiler to optimize across multiple files and generate a single object file.

Syntax

Linux OS:

`-ipo-c`

macOS:

`-ipo-c`

Windows OS:

`/Qipo-c`

Arguments

None

Default

OFF	The compiler does not generate a multifile object file.

Description

This option tells the compiler to optimize across multiple files and generate a single object file (named ipo_out.o on Linux* and macOS systems; ipo_out.obj on Windows* systems).

It performs the same optimizations as the `[Q]ipo` option, but compilation stops before the final link stage, leaving an optimized object file that can be used in further link steps.

IDE Equivalent

None

Alternate Options

None

See Also

`ipo, Qipo` compiler option

ipo-jobs, Qipo-jobs

Specifies the number of commands (jobs) to be executed simultaneously during the link phase of Interprocedural Optimization (IPO).

Syntax

Linux OS:

`-ipo-jobsn`

macOS:

`-ipo-jobsn`

Windows OS:

`/Qipo-jobs:n`

Arguments

n	Is the number of commands (jobs) to run simultaneously. The number must be greater than or equal to 1.

Default

`-ipo-jobs1` or `/Qipo-jobs:1`	One command (job) is executed in an interprocedural optimization parallel build.

Description

This option specifies the number of commands (jobs) to be executed simultaneously during the link phase of Interprocedural Optimization (IPO). It should only be used if the link-time compilation is generating more than one object. In this case, each object is generated by a separate compilation, which can be done in parallel.

This option can be affected by the following compiler options:

- `[Q]ipo` when applications are large enough that the compiler decides to generate multiple object files.
- `[Q]ipon` when *n* is greater than 1.
- `[Q]ipo-separate`

> **Caution**
> Be careful when using this option. On a multi-processor system with lots of memory, it can speed application build time. However, if *n* is greater than the number of processors, or if there is not enough memory to avoid thrashing, this option can increase application build time.

IDE Equivalent

None

Alternate Options

None

See Also

`ipo, Qipo` compiler option

`ipo-separate, Qipo-separate` compiler option

ipo-S, Qipo-S

Tells the compiler to optimize across multiple files and generate a single assembly file.

Syntax

Linux OS:

`-ipo-S`

macOS:

`-ipo-S`

Windows OS:

`/Qipo-S`

Arguments

None

Default

OFF	The compiler does not generate a multifile assembly file.

Description

This option tells the compiler to optimize across multiple files and generate a single assembly file (named ipo_out.s on Linux* and macOS systems; ipo_out.asm on Windows* systems).

It performs the same optimizations as the `[Q]ipo` option, but compilation stops before the final link stage, leaving an optimized assembly file that can be used in further link steps.

IDE Equivalent

None

Alternate Options

None

See Also

`ipo, Qipo` compiler option

ipo-separate, Qipo-separate

Tells the compiler to generate one object file for every source file.

Syntax

Linux OS:

`-ipo-separate`

macOS:

`None`

Windows OS:

`/Qipo-separate`

Arguments

None

Default

OFF	The compiler decides whether to create one or more object files.

Description

This option tells the compiler to generate one object file for every source file. It overrides any `[Q]ipo` option specification.

IDE Equivalent

None

Alternate Options

None

`ipo, Qipo` compiler option

Advanced Optimization Options

This section contains descriptions for compiler options that pertain to advanced optimization.

alias-const, Qalias-const

Determines whether the compiler assumes a parameter of type pointer-to-const does not alias with a parameter of type pointer-to-non-const.

Syntax

Linux OS:

`-alias-const`

`-no-alias-const`

macOS:

`-alias-const`

`-no-alias-const`

Windows OS:

`/Qalias-const`

`/Qalias-const-`

Arguments

None

Default

`-no-alias-const` or `/Qalias-const-`	The compiler uses standard C/C++ rules for the interpretation of const.

Description

This option determines whether the compiler assumes a parameter of type pointer-to-const does not alias with a parameter of type pointer-to-non-const. It implies an additional attribute for const.

This functionality complies with the input/output buffer rule, which assumes that input and output buffer arguments do not overlap. This option allows the compiler to do some additional optimizations with those parameters.

In C99, you can also get the same result if you additionally declare your pointer parameters with the restrict keyword.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Data > Assume Restrict Semantics for Const**

OS X

Xcode: **Data > Assume Restrict Semantics for Const**

Alternate Options

None

ansi-alias, Qansi-alias

Enables or disables the use of ANSI aliasing rules in optimizations.

Syntax

Linux OS:

`-ansi-alias`

`-no-ansi-alias`

macOS:

`-ansi-alias`

`-no-ansi-alias`

Windows OS:

`/Qansi-alias`

`/Qansi-alias-`

Arguments

None

Default

Windows* systems: `/Qansi-alias-`	ANSI aliasing rules are disabled in optimizations.
Linux* and macOS systems: `-ansi-alias`	ANSI aliasing rules are enabled in optimizations.

Description

This option tells the compiler to assume that the program adheres to ISO C Standard aliasability rules.

If your program adheres to the ANSI aliasability rules, this option allows the compiler to optimize more aggressively. If your program does not adhere to these rules, this option may cause the compiler to generate incorrect code.

If you are compiling on a Linux* or an macOS system and your program does not adhere to the ANSI aliasability rules, you can specify `-no-ansi-alias` to ensure program correctness.

When you specify the `[Q]ansi-alias` option, the ansi-alias checker is enabled by default. To disable the ansi-alias checker, you must specify `-no-ansi-alias-check` (Linux* and macOS) or `/Qansi-alias-check-` (Windows*).

IDE Equivalent

Windows

Visual Studio: **Language > Enable Use of ANSI Aliasing Rules in Optimizations**

Linux

Eclipse: **Language > Enable Use of ANSI Aliasing Rules in Optimizations**

OS X

Xcode: **Language > Enable ANSI Aliasing**

Alternate Options

Linux and macOS: `-fstrict-aliasing`

Windows: None

See Also

ansi-alias-check, Qansi-alias-check
compiler option

ansi-alias-check, Qansi-alias-check

Enables or disables the ansi-alias checker.

Syntax

Linux OS:

`-ansi-alias-check`

`-no-ansi-alias-check`

macOS:

`-ansi-alias-check`

`-no-ansi-alias-check`

Windows OS:

`/Qansi-alias-check`

`/Qansi-alias-check-`

Arguments

None

Default

`-no-ansi-alias-check` or `/Qansi-alias-check-`	The ansi-alias checker is disabled unless option `-ansi-alias-check` or `/Qansi-alias-check` has been specified.

Description

This option enables or disables the ansi-alias checker. The ansi-alias checker checks the source code for potential violations of ANSI aliasing rules and disables unsafe optimizations related to the code for those statements that are identified as potential violations.

You can use option `-Wstrict-aliasing` to identify potential violations.

If the `[Q]ansi-alias` option has been specified, the ansi-alias checker is enabled by default. You can use the negative form of the option (see Syntax above) to disable the checker.

IDE Equivalent

None

Alternate Options

None

See Also

ansi-alias, Qansi-alias
  compiler option

Wstrict-aliasing
  compiler option

complex-limited-range, Qcomplex-limited-range

Determines whether the use of basic algebraic expansions of some arithmetic operations involving data of type COMPLEX is enabled.

Syntax

Linux OS:

`-complex-limited-range`

`-no-complex-limited-range`

macOS:

`-complex-limited-range`

`-no-complex-limited-range`

Windows OS:

`/Qcomplex-limited-range`

`/Qcomplex-limited-range-`

Arguments

None

Default

`-no-complex-limited-range` or `/Qcomplex-limited-range-`	Basic algebraic expansions of some arithmetic operations involving data of type COMPLEX are disabled.

Description

This option determines whether the use of basic algebraic expansions of some arithmetic operations involving data of type COMPLEX is enabled.

When the option is enabled, this can cause performance improvements in programs that use a lot of COMPLEX arithmetic. However, values at the extremes of the exponent range may not compute correctly.

IDE Equivalent

Windows

Visual Studio: **Floating Point > Limit COMPLEX Range**

Linux

Eclipse: **Floating Point > Limit COMPLEX Range**

OS X

Xcode: **Floating Point > Limit COMPLEX Range**

Alternate Options

None

fargument-alias, Qalias-args

Determines whether function arguments can alias each other.

Syntax

Linux OS and macOS:

`-fargument-alias`

`-fargument-noalias`

Windows OS:

`/Qalias-args`

`/Qalias-args-`

Arguments

None

Default

`-fargument-alias` or `/Qalias-args`	Function arguments can alias each other and can alias global storage.

Description

This option determines whether function arguments can alias each other. If you specify `-fargument-noalias` or `/Qalias-args-`, function arguments cannot alias each other, but they can alias global storage.

On Linux and macOS systems, you can also disable aliasing for global storage, by specifying option `-fargument-noalias-global`.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Data > Enable Argument Aliasing**

OS X

Xcode: **Data > Enable Argument Aliasing**

See Also

`fargument-noalias-global` compiler option

fargument-noalias-global

Tells the compiler that function arguments cannot alias each other and cannot alias global storage.

Syntax

Linux OS and macOS:

`-fargument-noalias-global`

Windows OS:

None

Arguments

None

Default

OFF	Function arguments can alias each other and can alias global storage.

Description

This option tells the compiler that function arguments cannot alias each other and they cannot alias global storage.

If you only want to prevent function arguments from being able to alias each other, specify option `-fargument-noalias`.

IDE Equivalent

None

Alternate Options

None

See Also

fargument-alias, Qalias-args
compiler option

ffreestanding, Qfreestanding

Ensures that compilation takes place in a freestanding environment.

Syntax

Linux OS:

`-ffreestanding`

macOS:

`-ffreestanding`

Windows OS:

`/Qfreestanding`

Arguments

None

Default

OFF	Standard libraries are used during compilation.

Description

This option ensures that compilation takes place in a freestanding environment. The compiler assumes that the standard library may not exist and program startup may not necessarily be at main. This environment meets the definition of a freestanding environment as described in the C and C++ standard.

An example of an application requiring such an environment is an OS kernel.

NOTE
When you specify this option, the compiler will not assume the presence of compiler-specific libraries. It will only generate calls that appear in the source code.

IDE Equivalent

None

Alternate Options

None

fjump-tables

Determines whether jump tables are generated for switch statements.

Syntax

Linux OS:

`-fjump-tables`

`-fno-jump-tables`

macOS:

`-fjump-tables`

`-fno-jump-tables`

Windows OS:

`None`

Arguments

None

Default

`-fjump-tables`	The compiler may use jump tables for switch statements.

Description

This option determines whether jump tables are generated for switch statements.

Option `-fno-jump-tables` prevents the compiler from generating jump tables for switch statements. This action is performed unconditionally and independent of any generated code performance consideration.

Option `-fno-jump-tables` also prevents the compiler from creating switch statements internally as a result of optimizations.

Use `-fno-jump-tables` with `-fpic` when compiling objects that will be loaded in a way where the jump table relocation cannot be resolved.

IDE Equivalent

None

Alternate Options

None

See Also

`fpic` compiler option

ftls-model

Changes the thread local storage (TLS) model.

Syntax

Linux OS:

`-ftls-model=`*model*

macOS:

`-ftls-model=`*model*

Windows OS:

None

Arguments

model	Determines the TLS model used by the compiler. Possible values are:	
	`global-dynamic`	Generates a generic TLS code. The code can be used everywhere and the code can access variables defined anywhere else. This setting causes the largest size code to be generated and uses the most run time to produce.
	`local-dynamic`	Generates an optimized TLS code. To use this setting, the thread-local variables must be defined in the same object in which they are referenced.
	`initial-exec`	Generates a restrictive, optimized TLS code. To use this setting, the thread-local variables accessed must be defined in one of the modules available to the program.
	`local-exec`	Generates the most restrictive TLS code. To use this setting, the thread-local variables must be defined in the executable.

Default

OFF	The compiler uses default heuristics when determining the thread-local storage model.

Description

This option changes the thread local storage (TLS) model. Thread-local storage is a mechanism by which variables are allocated in a way that causes one instance of the variable per extant thread.

For more information on the thread-storage localization models, see the appropriate GCC* documentation.

For more information on the thread-storage localization models, see the appropriate Clang documentation.

IDE Equivalent

None

Alternate Options

None

funroll-all-loops

Unroll all loops even if the number of iterations is uncertain when the loop is entered.

Syntax

Linux OS and macOS:

`-funroll-all-loops`

Windows OS:

None

Arguments

None

Default

OFF	Do not unroll all loops.

Description

Unroll all loops, even if the number of iterations is uncertain when the loop is entered. There may a performance impact with this option.

IDE Equivalent

None

Alternate Options

None

guide, Qguide

Lets you set a level of guidance for auto-vectorization, auto parallelism, and data transformation.

Syntax

Linux OS:

`-guide[=n]`

macOS:

`-guide[=n]`

Windows OS:

`/Qguide[:n]`

Arguments

n	Is an optional value specifying the level of guidance to be provided.

The values available are 1 through 4. Value 1 indicates a standard level of guidance. Value 4 indicates the most advanced level of guidance. If *n* is omitted, the default is 4.

Default

OFF	You do not receive guidance about how to improve optimizations for parallelism, vectorization, and data transformation.

Description

This option lets you set a level of guidance (advice) for auto-vectorization, auto parallelism, and data transformation. It causes the compiler to generate messages suggesting ways to improve these optimizations.

When this option is specified, the compiler does not produce any objects or executables.

You must also specify the `[Q]parallel` option to receive auto parallelism guidance.

You can set levels of guidance for the individual guide optimizations by specifying one of the following options:

`[Q]guide-data-trans`	Provides guidance for data transformation.
`[Q]guide-par`	Provides guidance for auto parallelism.
`[Q]guide-vec`	Provides guidance for auto-vectorization.

If you specify the `[Q]guide` option and also specify one of the options setting a level of guidance for an individual guide optimization, the value set for the individual guide optimization will override the setting specified in `[Q]guide`.

If you do not specify `[Q]guide`, but specify one of the options setting a level of guidance for an individual guide optimization, option `[Q]guide` is enabled with the greatest value passed among any of the three individual guide optimizations specified.

In debug mode, this option has no effect unless option `O2` (or higher) is explicitly specified in the same command line.

NOTE
The compiler speculatively performs optimizations as part of guide analysis. As a result, when you use guided auto-parallelism options with options that produce vectorization or auto-parallelizer reports (such as option `[q or Q]opt-report`), the compiler generates "LOOP WAS VECTORIZED" or similar messages as if the compilation was performed with the recommended changes.

When compilation is performed with the `[Q]guide` option, you should use extra caution when interpreting vectorizer diagnostics and auto-parallelizer diagnostics.

NOTE
You can specify `[Q]diag-disable` to prevent the compiler from issuing one or more diagnostic messages.

IDE Equivalent

Visual Studio

Visual Studio: **Diagnostics > Guided Auto Parallelism Analysis**

Eclipse

Eclipse: **Compilation Diagnostics > Enable Guided Auto Parallelism Analysis**

Xcode

Xcode: **Diagnostics > Enable Guided Auto Parallelism Analysis**

Alternate Options

None

`guide-opts, Qguide-opts` compiler option
`diag, Qdiag` compiler option
`qopt-report, Qopt-report` compiler option

guide-data-trans, Qguide-data-trans

Lets you set a level of guidance for data transformation.

Syntax

Linux OS:

`-guide-data-trans[=`*n*`]`

macOS:

`-guide-data-trans[=`*n*`]`

Windows OS:

`/Qguide-data-trans[:`*n*`]`

Arguments

n	Is an optional value specifying the level of guidance to be provided. The values available are 1 through 4. Value 1 indicates a standard level of guidance. Value 4 indicates the most advanced level of guidance. If *n* is omitted, the default is 4.

Default

OFF	You do not receive guidance about how to improve optimizations for data transformation.

Description

This option lets you set a level of guidance for data transformation. It causes the compiler to generate messages suggesting ways to improve that optimization.

IDE Equivalent

None

Alternate Options

None

See Also

`guide, Qguide` compiler option

`guide-par, Qguide-par` compiler option

`guide-vec, Qguide-vec` compiler option

`guide-file, Qguide-file` compiler option

guide-file, Qguide-file

Causes the results of guided auto parallelism to be output to a file.

Syntax

Linux OS:

`-guide-file[=`*`filename`*`]`

macOS:

`-guide-file[=`*`filename`*`]`

Windows OS:

`/Qguide-file[:`*`filename`*`]`

Arguments

filename	Is the name of the file for output. It can include a path.

Default

OFF	Messages that are generated by guided auto parallelism are output to stderr.

Description

This option causes the results of guided auto parallelism to be output to a file.

This option is ignored unless you also specify one or more of the following options:

- `[Q]guide`
- `[Q]guide-vec`
- `[Q]guide-data-trans`
- `[Q]guide-par`

If you do not specify a path, the file is placed in the current working directory.

If there is already a file named *filename*, it will be overwritten.

You can include a file extension in *filename*. For example, if *file.txt* is specified, the name of the output file is *file.txt*. If you do not provide a file extension, the name of the file is *filename.guide*.

If you do not specify *filename*, the name of the file is *name-of-the-first-source-file.guide*. This is also the name of the file if the name specified for *filename* conflicts with a source file name provided in the command line.

NOTE
If you specify the `[Q]guide-file` option and you also specify option `[Q]guide-file-append`, the last option specified on the command line takes precedence.

IDE Equivalent

Windows

Visual Studio: **Diagnostics > Emit Guided Auto Parallelism Diagnostics to File**

Diagnostics > Guided Auto Parallelism Diagnostics File

Linux

Eclipse: **Compilation Diagnostics > Emit Guided Auto Parallelism diagnostics to File**

Compilation Diagnostics > Guided Auto Parallelism Report File

OS X

Xcode: **Diagnostics > Emit Guided Auto Parallelism diagnostics to File**

Diagnostics > Guided Auto Parallelism Report File

Alternate Options

None

Example

The following example shows how to cause guided auto parallelism messages to be output to a file named *my_guided_autopar.guide*:

```
-guide-file=my_guided_autopar       ! Linux and macOS systems
/Qguide-file:my_guided_autopar      ! Windows systems
```

See Also

`guide, Qguide` compiler option
`guide-file-append, Qguide-file-append` compiler option

guide-file-append, Qguide-file-append

Causes the results of guided auto parallelism to be appended to a file.

Syntax

Linux OS:

`-guide-file-append[=`*`filename`*`]`

macOS:

`-guide-file-append[=`*`filename`*`]`

Windows OS:

`/Qguide-file-append[:`*`filename`*`]`

Arguments

filename	Is the name of the file to be appended to. It can include a path.

Default

OFF	Messages that are generated by guided auto parallelism are output to stderr.

Description

This option causes the results of guided auto parallelism to be appended to a file.

This option is ignored unless you also specify one or more of the following options:

- `[Q]guide`
- `[Q]guide-vec`
- `[Q]guide-data-trans`
- `[Q]guide-par`

If you do not specify a path, the compiler looks for *filename* in the current working directory.

If *filename* is not found, then a new file with that name is created in the current working directory.

If you do not specify a file extension, the name of the file is *filename.guide*.

If the name specified for *filename* conflicts with a source file name provided in the command line, the name of the file is *name-of-the-first-source-file.guide*.

> **NOTE**
> If you specify the `[Q]guide-file-append` option and you also specify option `[Q]guide-file`, the last option specified on the command line takes precedence.

IDE Equivalent

None

Alternate Options

None

Example

The following example shows how to cause guided auto parallelism messages to be appended to a file named *my_messages.txt*:

```
-guide-file-append=my_messages.txt      ! Linux and macOS systems
/Qguide-file-append:my_messages.txt     ! Windows systems
```

See Also

`guide, Qguide` compiler option

`guide-file, Qguide-file` compiler option

guide-opts, Qguide-opts

Tells the compiler to analyze certain code and generate recommendations that may improve optimizations.

Syntax

Linux OS:

`-guide-opts=`*`string`*

macOS:

`-guide-opts=`*`string`*

Windows OS:

`/Qguide-opts:`*`string`*

Arguments

string

Is the text denoting the code to analyze. The string must appear within quotes. It can take one or more of the following forms:

filename
filename, *routine*
filename, *range* [, *range*]...
filename, *routine*, *range* [, *range*]...

If you specify more than one of the above forms in a string, a semicolon must appear between each form. If you specify more than one *range* in a string, a comma must appear between each *range*. Optional blanks can follow each parameter in the forms above and they can also follow each form in a string.

filename

Specifies the name of a file to be analyzed. It can include a path.

If you do not specify a path, the compiler looks for filename in the current working directory.

routine

Specifies the name of a routine to be analyzed. You can include an identifying parameter.

The name, including any parameter, must be enclosed in single quotes.

The compiler tries to uniquely identify the routine that corresponds to the specified routine name. It may select multiple routines to analyze, especially if the following is true:

- More than one routine has the specified routine name, so the routine cannot be uniquely identified.
- No parameter information has been specified to narrow the number of routines selected as matches.

range

Specifies a range of line numbers to analyze in the file or routine specified. The *range* must be specified in integers in the form:

first_line_number-last_line_number

The hyphen between the line numbers is required.

Default

OFF	You do not receive guidance on how to improve optimizations. However, if you specify the `[Q]guide` option, the compiler analyzes and generates recommendations for all the code in an application

Description

This option tells the compiler to analyze certain code and generate recommendations that may improve optimizations.

This option is ignored unless you also specify one or more of the following options:

- `[Q]guide`
- `[Q]guide-vec`
- `[Q]guide-data-trans`
- `[Q]guide-par`

When the `[Q]guide-opts` option is specified, a message is output that includes which parts of the input files are being analyzed. If a routine is selected to be analyzed, the complete routine name will appear in the generated message.

When inlining is involved, you should specify callee line numbers. Generated messages also use callee line numbers.

IDE Equivalent

Visual Studio

Visual Studio: **Diagnostics > Guided Auto Parallelism Code Selection Options**

Eclipse

Eclipse: **Compilation Diagnostics > Guided Auto Parallelism Code Selection**

Xcode

Xcode: **Diagnostics > Guided Auto Parallelism Code Selection**

Alternate Options

None

Example

Consider the following:

```
Linux*: -guide-opts="v.c, 1-10; v2.c, 1-40, 50-90, 100-200; v5.c, 300-400; x.c, 'funca(int)',
22-44, 55-77, 88-99; y.c, 'funcb'"
```

```
Windows*: /Qguide-opts:"v.c, 1-10; v2.c, 1-40, 50-90, 100-200; v5.c, 300-400; x.c, 'funca(int)',
22-44, 55-77, 88-99; y.c, 'funcb'"
```

The above command causes the following to be analyzed:

file v.c, line numbers 1 to 10
file v2.c, line numbers 1 to 40, 50 to 90, and 100 to 200
file v5.c, line numbers 300 to 400

file x.c, routine funca with parameter (int), line numbers 22 to 44, 55 to 77, and 88 to 99
file y.c, routine funcb

`guide-file, Qguide-file` compiler option

guide-par, Qguide-par

Lets you set a level of guidance for auto parallelism.

Syntax

Linux OS:

`-guide-par[=n]`

macOS:

`-guide-par[=n]`

Windows OS:

`/Qguide-par[:n]`

Arguments

n	Is an optional value specifying the level of guidance to be provided. The values available are 1 through 4. Value 1 indicates a standard level of guidance. Value 4 indicates the most advanced level of guidance. If *n* is omitted, the default is 4.

Default

OFF	You do not receive guidance about how to improve optimizations for parallelism.

Description

This option lets you set a level of guidance for auto parallelism. It causes the compiler to generate messages suggesting ways to improve that optimization.

You must also specify the `[Q]parallel` option to receive auto parallelism guidance.

IDE Equivalent

None

Alternate Options

None

ipp-link, Qipp-link

Controls whether the compiler links to static or dynamic threaded Intel® Integrated Performance Primitives (Intel® IPP) run-time libraries.

Syntax

Linux OS:

`-ipp-link[=lib]`

macOS:

`-ipp-link[=lib]`

Windows OS:

`/Qipp-link[:lib]`

Arguments

lib	Specifies the Intel® IPP library to use. Possible values are:	
	`static`	Tells the compiler to link to the set of static run-time libraries.
	`dynamic`	Tells the compiler to link to the set of dynamic threaded run-time libraries.

Default

`dynamic`	The compiler links to the Intel® IPP set of dynamic run-time libraries. However, if Linux* option `-static` is specified, the compiler links to the set of static run-time libraries.

Description

This option controls whether the compiler links to static or dynamic threaded Intel® Integrated Performance Primitives (Intel® IPP) run-time libraries.

To use this option, you must also specify the `[Q]ipp` option.

`ipp, Qipp` compiler option

qdaal, Qdaal

Tells the compiler to link to certain libraries in the Intel® oneAPI Data Analytics Library (oneDAL).

Syntax

Linux OS:

`-qdaal[=lib]`

macOS:

`-qdaal[=lib]`

Windows OS:

`/Qdaal[:lib]`

Arguments

lib	Indicates which oneDAL library files should be linked. Possible values are:
	`parallel` — Tells the compiler to link using the threaded oneDAL libraries. This is the default if the option is specified with no *lib*.
	`sequential` — Tells the compiler to link using the non-threaded oneDAL libraries.

Default

OFF	The compiler does not link to the oneDAL.

Description

This option tells the compiler to link to certain libraries in the Intel® oneAPI Data Analytics Library (oneDAL).

On Linux* and macOS systems, the associated oneDAL headers are included when you specify this option.

> **NOTE**
> On Windows* systems, this option adds directives to the compiled code, which the linker then reads without further input from the driver. You do not need to specify a separate link command.
>
> On Linux* and macOS systems, the driver must add the library names explicitly to the link command. You must use option `-qdaal` to perform the link to pull in the dependent libraries.

Using Intel® Performance Libraries

qipp, Qipp

Tells the compiler to link to some or all of the Intel® Integrated Performance Primitives (Intel® IPP) libraries.

Syntax

Linux OS:

`-qipp[=`*`lib`*`]`

macOS:

`-qipp[=`*`lib`*`]`

Windows OS:

`/Qipp[:`*`lib`*`]`

Arguments

lib	Indicates the Intel® IPP libraries that the compiler should link to. Possible values are:	
	`common`	Tells the compiler to link using the main libraries set. This is the default if the option is specified with no *lib*.
	`crypto`	Tells the compiler to link using the Intel® Integrated Performance Primitives Cryptography (Intel® IPP Cryptography) libraries.
	`nonpic` (Linux* only)	Tells the compiler to link using the version of the libraries that do not have position-independent code.
	`nonpic_crypto` (Linux only)	Tells the compiler to link using the Intel® IPP Cryptography libraries. It uses the version of the libraries that do not have position-independent code.

Default

OFF	The compiler does not link to the Intel® IPP libraries.

Description

The option tells the compiler to link to some or all of the Intel® IPP libraries and include the Intel® IPP headers.

The `[Q]ipp-link` option controls whether the compiler links to static, dynamic threaded, or static threaded Intel® IPP runtime libraries.

> **NOTE**
> On Windows* systems, this option adds directives to the compiled code, which the linker then reads without further input from the driver. You do not need to specify a separate link command.
>
> On Linux* and macOS systems, the driver must add the library names explicitly to the link command. You must use option `qipp` to perform the link to pull in the dependent libraries.

`ipp-link, Qipp-link` compiler option

qmkl, Qmkl

Tells the compiler to link to certain libraries in the Intel® oneAPI Math Kernel Library (oneMKL). On Windows systems, you must specify this option at compile time.

Syntax

Linux OS:

-qmkl[=*lib*]

macOS:

`-qmkl[=lib]`

Windows OS:

`/Qmkl[:lib]`

Arguments

lib Indicates which oneMKL library files should be linked. Possible values are:

`parallel`	Tells the compiler to link using the threaded libraries in oneMKL. This is the default if the option is specified with no *lib*.
`sequential`	Tells the compiler to link using the sequential libraries in oneMKL.
`cluster`	Tells the compiler to link using the cluster-specific libraries and the sequential libraries in oneMKL. Cluster-specific libraries are not available for macOS.

Default

OFF	The compiler does not link to the oneMKL library.

Description

This option tells the compiler to link to certain libraries in the Intel® oneAPI Math Kernel Library (oneMKL).

On Linux* and macOS systems, dynamic linking is the default when you specify `-mkl`. To link with oneMKL statically, you must specify:

```
-qmkl -static-intel
```

On Windows* systems, static linking is the default when you specify `/Qmkl`. To link with oneMKL dynamically, you must specify:

```
/Qmkl /MD
```

For more information about using oneMKL libraries, see the article titled: Intel® oneAPI Math Kernel Library Link Line Advisor.

NOTE
On Windows* systems, this option adds directives to the compiled code, which the linker then reads without further input from the driver. On Linux* and macOS systems, the driver must add the library names explicitly to the link command.

NOTE
If you specify option `[q or Q]mkl`, or `-qmkl=parallel` or `/Qmkl:parallel`, and you also specify option `[Q]tbb`, the compiler links to the standard threaded version of oneMKL.

However, if you specify `[q or Q]mkl`, or `-qmkl=parallel` or `/Qmkl:parallel`, and you also specify option `[Q]tbb` and option `[q or Q]openmp`, the compiler links to the OpenMP* threaded version of oneMKL.

IDE Equivalent

Visual Studio: None

Eclipse: **Performance Library Build Components > Use Intel® oneAPI Math Kernel Library**

Xcode: **Performance Library Build Components > Use Intel® oneAPI Math Kernel Library**

Alternate Options

Linux and macOS: `-mkl` (this is a deprecated option)

See Also

`static-intel` compiler option
`MD` compiler option

qopt-args-in-regs, Qopt-args-in-regs

Determines whether calls to routines are optimized by passing parameters in registers instead of on the stack. This is a deprecated option that may be removed in a future release.

Architecture Restrictions

Only available on IA-32 architecture. IA-32 support has been deprecated, and will be removed in a future release.

Syntax

Linux OS:

`-qopt-args-in-regs[=`*`keyword`*`]`

macOS:

`None`

Windows OS:

`/Qopt-args-in-regs[:`*`keyword`*`]`

Arguments

keyword Specifies whether the optimization should be performed and under what conditions. Possible values are:

`none`	The optimization is not performed. No parameters are passed in registers. They are put on the stack.
`seen`	Causes parameters to be passed in registers when they are passed to routines whose definition can be seen in the same compilation unit.
`all`	Causes parameters to be passed in registers, whether they are passed to routines whose definition can be seen in the same compilation unit, or not. This value is only available on Linux* systems.

Default

`-qopt-args-in-regs=seen` or `/Qopt-args-in-regs:seen`	Parameters are passed in registers when they are passed to routines whose definition is seen in the same compilation unit.

Description

This option determines whether calls to routines are optimized by passing parameters in registers instead of on the stack. It also indicates the conditions when the optimization will be performed.

This is a deprecated option that may be removed in a future release. There is no replacement option.

This option can improve performance for Application Binary Interfaces (ABIs) that require parameters to be passed in memory and compiled without interprocedural optimization (IPO).

Note that on Linux* systems, if `all` is specified, a small overhead may be paid when calling "unseen" routines that have not been compiled with the same option. This is because the call will need to go through a "thunk" to ensure that parameters are placed back on the stack where the callee expects them.

IDE Equivalent

None

Alternate Options

None

qopt-assume-safe-padding, Qopt-assume-safe-padding

Determines whether the compiler assumes that variables and dynamically allocated memory are padded past the end of the object.

Architecture Restrictions

Only available on all architectures that support Intel® Advanced Vector Extensions 512 (Intel® AVX-512) Foundation instructions

Syntax

Linux OS:

`-qopt-assume-safe-padding`

`-qno-opt-assume-safe-padding`

macOS:

`-qopt-assume-safe-padding`

`-qno-opt-assume-safe-padding`

Windows OS:

`/Qopt-assume-safe-padding`

`/Qopt-assume-safe-padding-`

Arguments

None

Default

`-qno-opt-assume-safe-padding` or `/Qopt-assume-safe-padding-`	The compiler will not assume that variables and dynamically allocated memory are padded past the end of the object. It will adhere to the sizes specified in your program.

Description

This option determines whether the compiler assumes that variables and dynamically allocated memory are padded past the end of the object.

When you specify option `[q or Q]opt-assume-safe-padding`, the compiler assumes that variables and dynamically allocated memory are padded. This means that code can access up to 64 bytes beyond what is specified in your program.

The compiler does not add any padding for static and automatic objects when this option is used, but it assumes that code can access up to 64 bytes beyond the end of the object, wherever the object appears in the program. To satisfy this assumption, you must increase the size of static and automatic objects in your program when you use this option.

This option may improve performance of memory operations.

IDE Equivalent

None

Alternate Options

None

qopt-block-factor, Qopt-block-factor

Lets you specify a loop blocking factor.

Syntax

Linux OS:

`-qopt-block-factor=`*n*

macOS:

`-qopt-block-factor=`*n*

Windows OS:

`/Qopt-block-factor:`*n*

Arguments

n	Is the blocking factor. It must be an integer. The compiler may ignore the blocking factor if the value is 0 or 1.

Default

OFF	The compiler uses default heuristics for loop blocking.

Description

This option lets you specify a loop blocking factor.

IDE Equivalent

Windows

Visual Studio: **Diagnostics > Optimization Diagnostic File**

Diagnostics > Emit Optimization Diagnostics to File

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

qopt-calloc

Tells the compiler to substitute a call to _intel_fast_calloc() for a call to calloc().

Syntax

Linux OS:

`-qopt-calloc`

`-qno-opt-calloc`

macOS:

None

Windows OS:

None

Arguments

None

Default

`-qno-opt-calloc`	The compiler does not substitute a call to _intel_fast_calloc() for a call to calloc().

Description

This option tells the compiler to substitute a call to_intel_fast_calloc() for a call to calloc().

This option may increase the performance of long-running programs that use calloc() frequently. It is recommended for these programs over combinations of options `-inline-calloc` and `-qopt-malloc-options=3` because this option causes less memory fragmentation.

> **NOTE**
> Many routines in the LIBIRC library are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.

IDE Equivalent

None

Alternate Options

None

qopt-class-analysis, Qopt-class-analysis

Determines whether C++ class hierarchy information is used to analyze and resolve C++ virtual function calls at compile time.

Syntax

Linux OS and macOS:

`-qopt-class-analysis`

`-qno-opt-class-analysis`

Windows OS:

`/Qopt-class-analysis`

`/Qopt-class-analysis-`

Arguments

None

Default

`-qno-opt-class-analysis` or `/Qopt-class-analysis-`	C++ class hierarchy information is not used to analyze and resolve C++ virtual function calls at compile time.

Description

This option determines whether C++ class hierarchy information is used to analyze and resolve C++ virtual function calls at compile time. The option is turned on by default with the `-ipo` compiler option, enabling improved C++ optimization. If a C++ application contains non-standard C++ constructs, such as pointer down-casting, it may result in different behaviors.

IDE Equivalent

None

Alternate Options

None

qopt-dynamic-align, Qopt-dynamic-align

Enables or disables dynamic data alignment optimizations.

Syntax

Linux OS:

`-qopt-dynamic-align`

`-qno-opt-dynamic-align`

macOS:

`-qopt-dynamic-align`

`-qno-opt-dynamic-align`

Windows OS:

`/Qopt-dynamic-align`

`/Qopt-dynamic-align-`

Arguments

None

Default

`-qopt-dynamic-align` or `/Qopt-dynamic-align`	The compiler may generate code dynamically dependent on alignment. It may do optimizations based on data location for the best performance. The result of execution on some algorithms may depend on data layout.

Description

This option enables or disables dynamic data alignment optimizations.

If you specify `-qno-opt-dynamic-align` or `/Qopt-dynamic-align-`, the compiler generates no code dynamically dependent on alignment. It will not do any optimizations based on data location and results will depend on the data values themselves.

When you specify `[q or Q]qopt-dynamic-align`, the compiler may implement conditional optimizations based on dynamic alignment of the input data. These dynamic alignment optimizations may result in different bitwise results for aligned and unaligned data with the same values.

Dynamic alignment optimizations can improve the performance of some vectorized code, especially for long trip count loops, but there is an associated cost of increased code size and compile time. Disabling such optimizations can improve the performance of some other vectorized code. It may also improve bitwise reproducibility of results, factoring out data location from possible sources of discrepancy.

IDE Equivalent

None

Alternate Options

None

qopt-jump-tables, Qopt-jump-tables

Enables or disables generation of jump tables for switch statements.

Syntax

Linux OS:

`-qopt-jump-tables=`*`keyword`*

`-qno-opt-jump-tables`

macOS:

`-qopt-jump-tables=`*`keyword`*

`-qno-opt-jump-tables`

Windows OS:

`/Qopt-jump-tables:`*`keyword`*

`/Qopt-jump-tables-`

Arguments

keyword	Is the instruction for generating jump tables. Possible values are:	
	`never`	Tells the compiler to never generate jump tables. All switch statements are implemented as chains of if-then-elses. This is the same as specifying `-qno-opt-jump-tables` (Linux* and macOS) or `/Qopt-jump-tables-` (Windows*).
	`default`	The compiler uses default heuristics to determine when to generate jump tables.
	`large`	Tells the compiler to generate jump tables up to a certain pre-defined size (64K entries).
	`n`	Must be an integer. Tells the compiler to generate jump tables up to *n* entries in size.

Default

`-qopt-jump-tables=default` or `/Qopt-jump-tables:default`	The compiler uses default heuristics to determine when to generate jump tables for switch statements.

Description

This option enables or disables generation of jump tables for switch statements. When the option is enabled, it may improve performance for programs with large switch statements.

IDE Equivalent

None

Alternate Options

None

qopt-malloc-options

Lets you specify an alternate algorithm for malloc().

Syntax

Linux OS:

`-qopt-malloc-options=`*`n`*

macOS:

`-qopt-malloc-options=`*`n`*

Windows OS:

`None`

Arguments

n	Specifies the algorithm to use for malloc(). Possible values are:

`0`	Tells the compiler to use the default algorithm for malloc(). This is the default.
`1`	Causes the following adjustments to the malloc() algorithm: M_MMAP_MAX=2 and M_TRIM_THRESHOLD=0x10000000.
`2`	Causes the following adjustments to the malloc() algorithm: M_MMAP_MAX=2 and M_TRIM_THRESHOLD=0x40000000.
`3`	Causes the following adjustments to the malloc() algorithm: M_MMAP_MAX=0 and M_TRIM_THRESHOLD=-1.
`4`	Causes the following adjustments to the malloc() algorithm: M_MMAP_MAX=0, M_TRIM_THRESHOLD=-1, M_TOP_PAD=4096.

Default

`-qopt-malloc-options=0`	The compiler uses the default algorithm when malloc() is called. No call is made to mallopt().

Description

This option lets you specify an alternate algorithm for malloc().

If you specify a non-zero value for *n*, it causes alternate configuration parameters to be set for how malloc() allocates and frees memory. It tells the compiler to insert calls to mallopt() to adjust these parameters to malloc() for dynamic memory allocation. This may improve speed.

IDE Equivalent

None

Alternate Options

None

See Also

malloc(3) man page

mallopt function (defined in malloc.h)

qopt-matmul, Qopt-matmul

Enables or disables a compiler-generated Matrix Multiply (matmul) library call.

Syntax

Linux OS:

`-qopt-matmul`

`-qno-opt-matmul`

macOS:

`None`

Windows OS:

`/Qopt-matmul`

`/Qopt-matmul-`

Arguments

None

Default

`-qno-opt-matmul` or `/Qopt-matmul-`	The matmul library call optimization does not occur unless this option is enabled or certain other compiler options are specified (see below).

Description

This option enables or disables a compiler-generated Matrix Multiply (MATMUL) library call.

The `[q or Q]opt-matmul` option tells the compiler to identify matrix multiplication loop nests (if any) and replace them with a matmul library call for improved performance. The resulting executable may improve performance on Intel® microprocessors.

> **NOTE**
> This option is dependent upon the OpenMP* library. If your product does not support OpenMP, this option will have no effect.

This option has no effect unless option `O2` or higher is set.

> **NOTE**
> Many routines in the MATMUL library are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.

IDE Equivalent

Visual Studio

Visual Studio: **Optimization > Enable Matrix Multiply Library Call**

Eclipse

Eclipse: **Optimization > Optimize Matrix Multiplication**

Xcode

Xcode: None

Alternate Options

None

- `O` compiler option

qopt-mem-layout-trans, Qopt-mem-layout-trans

Controls the level of memory layout transformations performed by the compiler.

Syntax

Linux OS:

`-qopt-mem-layout-trans[=n]`

`-qno-opt-mem-layout-trans`

macOS:

`-qopt-mem-layout-trans[=n]`

`-qno-opt-mem-layout-trans`

Windows OS:

`/Qopt-mem-layout-trans[:n]`

`/Qopt-mem-layout-trans-`

Arguments

n Is the level of memory layout transformations. Possible values are:

0	Disables memory layout transformations. This is the same as specifying `-qno-opt-mem-layout-trans` (Linux* or macOS) or `/Qopt-mem-layout-trans-` (Windows*).
1	Enables basic memory layout transformations.
2	Enables more memory layout transformations. This is the same as specifying `[q or Q]opt-mem-layout-trans` with no argument.
3	Enables more memory layout transformations like copy-in/copy-out of structures for a region of code. You should only use this setting if your system has more than 4GB of physical memory per core.
4	Enables more aggressive memory layout transformations. You should only use this setting if your system has more than 4GB of physical memory per core.

Default

`-qopt-mem-layout-trans=2` or `/Qopt-mem-layout-trans:2`	The compiler performs moderate memory layout transformations.

Description

This option controls the level of memory layout transformations performed by the compiler. This option can improve cache reuse and cache locality.

Product and Performance Information
Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex.   Notice revision #20201201

IDE Equivalent

None

Alternate Options

None

qopt-multi-version-aggressive, Qopt-multi-version-aggressive

Tells the compiler to use aggressive multi-versioning to check for pointer aliasing and scalar replacement.

Syntax

Linux OS:

`-qopt-multi-version-aggressive`

`-qno-opt-multi-version-aggressive`

macOS:

`-qopt-multi-version-aggressive`

`-qno-opt-multi-version-aggressive`

Windows OS:

`/Qopt-multi-version-aggressive`

`/Qopt-multi-version-aggressive-`

Arguments

None

Default

`-qno-opt-multi-version-aggressive` or `/Qopt-multi-version-aggressive-`	The compiler uses default heuristics when checking for pointer aliasing and scalar replacement.

Description

This option tells the compiler to use aggressive multi-versioning to check for pointer aliasing and scalar replacement. This option may improve performance.

The performance can be affected by certain options, such as `/arch` or `/Qx` (Windows*) or `-m` or `-x` (Linux* and macOS).

IDE Equivalent

None

Alternate Options

None

qopt-multiple-gather-scatter-by-shuffles, Qopt-multiple-gather-scatter-by-shuffles

Enables or disables the optimization for multiple adjacent gather/scatter type vector memory references.

Syntax

Linux OS:

`-qopt-multiple-gather-scatter-by-shuffles`

`-qno-opt-multiple-gather-scatter-by-shuffles`

macOS:

`-qopt-multiple-gather-scatter-by-shuffles`

`-qno-opt-multiple-gather-scatter-by-shuffles`

Windows OS:

`/Qopt-multiple-gather-scatter-by-shuffles`

`/Qopt-multiple-gather-scatter-by-shuffles-`

Arguments

None

Default

varies	When this option is not specified, the compiler uses default heuristics for optimization.

Description

This option controls the optimization for multiple adjacent gather/scatter type vector memory references. This optimization hint is useful for performance tuning. It tries to generate more optimal software sequences using shuffles.

If you specify this option, the compiler will apply the optimization heuristics. If you specify `-qno-opt-multiple-gather-scatter-by-shuffles` or `/Qopt-multiple-gather-scatter-by-shuffles-`, the compiler will not apply the optimization.

> **NOTE**
> Optimization is affected by optimization compiler options, such as `[Q]x`, `-march` (Linux* or macOS), and `/arch` (Windows*).

Product and Performance Information
Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex. Notice revision #20201201

qopt-prefetch, Qopt-prefetch

Enables or disables prefetch insertion optimization.

Syntax

Linux OS:

`-qopt-prefetch[=n]`

`-qno-opt-prefetch`

macOS:

`-qopt-prefetch[=n]`

`-qno-opt-prefetch`

Windows OS:

`/Qopt-prefetch[:n]`

`/Qopt-prefetch-`

Arguments

n	Is the level of software prefetching optimization desired. Possible values are:	
	`0`	Disables software prefetching. This is the same as specifying `-qno-opt-prefetch` (Linux* and macOS) or `/Qopt-prefetch-` (Windows*).
	`1` to `5`	Enables different levels of software prefetching. If you do not specify a value for *n*, the default is `2`. Use lower values to reduce the amount of prefetching.

Default

`-qno-opt-prefetch` or `/Qopt-prefetch-`	Prefetch insertion optimization is disabled.

Description

This option enables or disables prefetch insertion optimization. The goal of prefetching is to reduce cache misses by providing hints to the processor about when data should be loaded into the cache.

This option enables prefetching when higher optimization levels are specified.

IDE Equivalent

Visual Studio

Visual Studio: None

Eclipse

Eclipse: **Optimization > Enable Prefetch Insertion**

Xcode

Xcode: **Optimization > Enable Prefetch Insertion**

Alternate Options

None

See Also

qopt-prefetch-distance, Qopt-prefetch-distance compiler option

qopt-prefetch-distance, Qopt-prefetch-distance

Specifies the prefetch distance to be used for compiler-generated prefetches inside loops.

Syntax

Linux OS:

`-qopt-prefetch-distance=`*n1*`[, `*n2*`]`

macOS:

`None`

Windows OS:

`/Qopt-prefetch-distance:`*n1*`[, `*n2*`]`

Arguments

n1, n2	Is the prefetch distance in terms of the number of (possibly-vectorized) iterations. Possible values are non-negative numbers >=0. *n2* is optional. *n1* = 0 turns off all compiler issued prefetches from memory to L2. *n2* = 0 turns off all compiler issued prefetches from L2 to L1. If *n2* is specified and *n1* > 0, *n1* should be >= *n2*.

Default

OFF	The compiler uses default heuristics to determine the prefetch distance.

Description

This option specifies the prefetch distance to be used for compiler-generated prefetches inside loops. The unit (*n1* and optionally *n2*) is the number of iterations. If the loop is vectorized by the compiler, the unit is the number of vectorized iterations.

The value of *n1* will be used as the distance for prefetches from memory to L2 (for example, the vprefetch1 instruction). If *n2* is specified, it will be used as the distance for prefetches from L2 to L1 (for example, the vprefetch0 instruction).

This option is ignored if option `-qopt-prefetch=0` (Linux*) or `/Qopt-prefetch:0` (Windows*) is specified.

IDE Equivalent

None

Alternate Options

None

Example

Consider the following Linux* examples:

```
-qopt-prefetch-distance=64,32
```

The above causes the compiler to use a distance of 64 iterations for memory to L2 prefetches, and a distance of 32 iterations for L2 to L1 prefetches.

```
-qopt-prefetch-distance=24
```

The above causes the compiler to use a distance of 24 iterations for memory to L2 prefetches. The distance for L2 to L1 prefetches will be determined by the compiler.

```
-qopt-prefetch-distance=0,4
```

The above turns off all memory to L2 prefetches inserted by the compiler inside loops. The compiler will use a distance of 4 iterations for L2 to L1 prefetches.

```
-qopt-prefetch-distance=16,0
```

The above causes the compiler to use a distance of 16 iterations for memory to L2 prefetches. No L2 to L1 loop prefetches are issued by the compiler.

See Also

qopt-prefetch, Qopt-prefetch compiler option
prefetch pragma

qopt-prefetch-issue-excl-hint, Qopt-prefetch-issue-excl-hint

Supports the prefetchW instruction in Intel® microarchitecture code name Broadwell and later.

Syntax

Linux OS:

`-qopt-prefetch-issue-excl-hint`

macOS:

None

Windows OS:

`/Qopt-prefetch-issue-excl-hint`

Arguments

None

Default

OFF	The compiler does not support the PREFETCHW instruction for this microarchitecture.

Description

This option supports the PREFETCHW instruction in Intel® microarchitecture code name Broadwell and later.

When you specify this option, you must also specify option `[q or Q]opt-prefetch`.

The prefetch instruction is merely a hint and does not affect program behavior. If executed, this instruction moves data closer to the processor and invalidates any other cached copy in anticipation of the line being written to in the future.

IDE Equivalent

None

Alternate Options

None

See Also

`qopt-prefetch/Qopt-prefetch` compiler option

qopt-ra-region-strategy, Qopt-ra-region-strategy

Selects the method that the register allocator uses to partition each routine into regions.

Syntax

Linux OS:

`-qopt-ra-region-strategy[=`*keyword*`]`

macOS:

`-qopt-ra-region-strategy[=`*keyword*`]`

Windows OS:

`/Qopt-ra-region-strategy[:`*keyword*`]`

Arguments

keyword Is the method used for partitioning. Possible values are:

`routine`	Creates a single region for each routine.
`block`	Partitions each routine into one region per basic block.
`trace`	Partitions each routine into one region per trace.
`loop`	Partitions each routine into one region per loop.
`default`	The compiler determines which method is used for partitioning.

Default

`-qopt-ra-region-strategy=default` or `/Qopt-ra-region-strategy:default`	The compiler determines which method is used for partitioning. This is also the default if `keyword` is not specified.

Description

This option selects the method that the register allocator uses to partition each routine into regions.

When setting `default` is in effect, the compiler attempts to optimize the tradeoff between compile-time performance and generated code performance.

This option is only relevant when optimizations are enabled (option `O1` or higher).

IDE Equivalent

None

Alternate Options

None

- O compiler option

qopt-streaming-stores, Qopt-streaming-stores

Enables generation of streaming stores for optimization.

Syntax

Linux OS and macOS:

`-qopt-streaming-stores=`*`keyword`*

`-qno-opt-streaming-stores`

Windows OS:

`/Qopt-streaming-stores:`*`keyword`*

`/Qopt-streaming-stores-`

Arguments

keyword Specifies whether streaming stores are generated. Possible values are:

`always`	Enables generation of streaming stores for optimization. The compiler optimizes under the assumption that the application is memory bound. When this option setting is specified, it is your responsibility to also insert any fences as required to ensure correct memory ordering within a thread or across threads. One typical way to do this is to insert a _mm_sfence() intrinsic call just after the

	loops (such as the initialization loop) where the compiler may insert streaming store instructions.
`never`	Disables generation of streaming stores for optimization. Normal stores are performed. This is the same as specifying `-qno-opt-streaming-stores` (Linux*) or `/Qopt-streaming-stores-` (Windows*).
`auto`	Lets the compiler decide which instructions to use.

Default

`-qopt-streaming-stores=auto` or `/Qopt-streaming-stores:auto`	The compiler decides whether to use streaming stores or normal stores.

Description

This option enables generation of streaming stores for optimization. This method stores data with instructions that use a non-temporal buffer, which minimizes memory hierarchy pollution.

This option may be useful for applications that can benefit from streaming stores.

IDE Equivalent

None

Alternate Options

None

Example

The following example shows a way to insert fences when specifying `-qopt-streaming-stores=always` or `/Qopt-streaming-stores:always`:

```
void simple1(double * restrict a, double * restrict b, double * restrict c, double *d, int n)
{
    int i, j;

#pragma omp parallel for
      for (j=0; j<n; j++) {
        a[j] = 1.0;
        b[j] = 2.0;
        c[j] = 0.0;
        }

      _mm_sfence(); // OR _mm_mfence();

#pragma omp parallel for
    for (i=0; i<n; i++)
        a[i] = a[i] + c[i]*b[i];
}
```

See Also

ax, Qax compiler option

x, Qx compiler option

qopt-subscript-in-range, Qopt-subscript-in-range

Determines whether the compiler assumes that there are no "large" integers being used or being computed inside loops.

Syntax

Linux OS:

`-qopt-subscript-in-range`

`-qno-opt-subscript-in-range`

macOS:

`-qopt-subscript-in-range`

`-qno-opt-subscript-in-range`

Windows OS:

`/Qopt-subscript-in-range`

`/Qopt-subscript-in-range-`

Arguments

None

Default

`-qno-opt-subscript-in-range` or `/Qopt-subscript-in-range-`	The compiler assumes there are "large" integers being used or being computed within loops.

Description

This option determines whether the compiler assumes that there are no "large" integers being used or being computed inside loops.

If you specify `[q or Q]opt-subscript-in-range`, the compiler assumes that there are no "large" integers being used or being computed inside loops. A "large" integer is typically > 2^{31}.

This feature can enable more loop transformations.

IDE Equivalent

None

Alternate Options

None

Example

The following example shows how these options can be useful. Variable m is declared as type long (64-bits) and all other variables inside the subscript are declared as type int (32-bits):

```
A[ i  + j  + ( n  + k) * m ]
```

qopt-zmm-usage, Qopt-zmm-usage

Defines a level of zmm registers usage.

Syntax

Linux OS:

`-qopt-zmm-usage=keyword`

macOS:

`-qopt-zmm-usage=keyword`

Windows OS:

`/Qopt-zmm-usage:keyword`

Arguments

keyword	Specifies the level of zmm registers usage. Possible values are:	
	`low`	Tells the compiler that the compiled program is unlikely to benefit from zmm registers usage. It specifies that the compiler should avoid using zmm registers unless it can prove the gain from their usage.
	`high`	Tells the compiler to generate zmm code without restrictions.

Default

varies	The default is low when you specify [Q]xCORE-AVX512. The default is high when you specify [Q]xCOMMON-AVX512.

Description

This option may provide better code optimization for Intel® processors that are on the Intel® microarchitecture formerly code-named Skylake.

This option defines a level of zmm registers usage. The `low` setting causes the compiler to generate code with zmm registers very carefully, only when the gain from their usage is proven. The `high` setting causes the compiler to use much less restrictive heuristics for zmm code generation.

It is not always easy to predict whether the `high` or the `low` setting will yield better performance. Programs that enjoy high performance gains from the use of xmm or ymm registers may expect performance improvement by moving to use zmm registers. However, some programs that use zmm registers may not gain as much or may even lose performance. We recommend that you try both option values to measure the performance of your programs.

This option is ignored if you do not specify an option that enables Intel® AVX-512, such as `[Q]xCORE-AVX512` or option `[Q]xCOMMON-AVX512`.

This option has no effect on loops that use pragma omp simd simdlen(n) or on functions that are generated by vector specifications specific to CORE-AVX512.

IDE Equivalent

None

Alternate Options

None

See Also

`x, Qx` compiler option

For more information about simd loops specification and vector function specification, see pragmas omp simd and omp declare simd in the OpenMP* TR4: Version 5.0 specification.

qoverride-limits, Qoverride-limits

Lets you override certain internal compiler limits that are intended to prevent excessive memory usage or compile times for very large, complex compilation units.

Syntax

Linux OS:

`-qoverride-limits`

macOS:

`-qoverride-limits`

Windows OS:

`/Qoverride-limits`

Arguments

None

Default

OFF	Certain internal compiler limits are not overridden. These limits are determined by default heuristics.

Description

This option provides a way to override certain internal compiler limits that are intended to prevent excessive memory usage or compile times for very large, complex compilation units.

If this option is not used and your program exceeds one of these internal compiler limits, some optimizations will be skipped to reduce the memory footprint and compile time. If you chose to create an optimization report by specifying `[q or Q]opt-report`, you may see a related diagnostic remark as part of the report.

Specifying this option may substantially increase compile time and/or memory usage.

NOTE
If you use this option, it is your responsibility to ensure that sufficient memory is available. If there is not sufficient available memory, the compilation may fail.

This option should only be used where there is a specific need; it is not recommended for inexperienced users.

IDE Equivalent

None

Alternate Options

None

qtbb, Qtbb

Tells the compiler to link to the Intel® oneAPI Threading Building Blocks (oneTBB) libraries.

Syntax

Linux OS:

`-qtbb`

macOS:

`-qtbb`

Windows OS:

`/Qtbb`

Arguments

None

Default

OFF	The compiler does not link to the oneTBB libraries.

Description

This option tells the compiler to link to the Intel® oneAPI Threading Building Blocks (oneTBB) libraries and include the oneTBB headers.

NOTE
On Windows* systems, this option adds directives to the compiled code, which the linker then reads without further input from the driver. You do not need to specify a separate link command.

On Linux* and macOS systems, the driver must add the library names explicitly to the link command. You must use option `-qtbb` to perform the link to pull in the dependent libraries.

IDE Equivalent

Visual Studio

Visual Studio: None

Eclipse

Eclipse: **Performance Library Build Components > Use Intel® oneAPI Threading Building Blocks**

Xcode

Xcode: **Performance Library Build Components > Use Intel® oneAPI Threading Building Blocks**

Alternate Options

Linux: `-tbb` (this is a deprecated option)

Qvla

Determines whether variable length arrays are enabled.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Qvla`

`/Qvla-`

Arguments

None

Default

`/Qvla-`	Variable length arrays are disabled.

Description

This option determines whether variable length arrays (a C99 feature) are enabled.

To enable variable length arrays, you must specify `/Qvla`.

IDE Equivalent

None

Alternate Options

None

scalar-rep, Qscalar-rep

Enables or disables the scalar replacement optimization done by the compiler as part of loop transformations.

Syntax

Linux OS:

`-scalar-rep`

`-no-scalar-rep`

macOS:

`-scalar-rep`

`-no-scalar-rep`

Windows OS:

`/Qscalar-rep`

`/Qscalar-rep-`

Arguments

None

Default

`-scalar-rep` or `/Qscalar-rep`	Scalar replacement is performed during loop transformation at optimization levels of O2 and above.

Description

This option enables or disables the scalar replacement optimization done by the compiler as part of loop transformations. This option takes effect only if you specify an optimization level of `O2` or higher.

IDE Equivalent

None

Alternate Options

None

See Also

O compiler option

simd, Qsimd

Enables or disables compiler interpretation of simd pragmas.

Syntax

Linux OS:

`-simd`

`-no-simd`

macOS:

`-simd`

`-no-simd`

Windows OS:

`/Qsimd`

`/Qsimd-`

Arguments

None

Default

`-simd`	SIMD pragmas are enabled.

or `/Qsimd`

Description

This option enables or disables compiler interpretation of simd pragmas.

To disable interpretation of simd pragmas, specify `-no-simd` (Linux* and macOS) or `/Qsimd-` (Windows*). Note that the compiler may still vectorize loops based on its own heuristics (leading to generation of SIMD instructions) even when `-no-simd` (or `/Qsimd-`) is specified.

To disable all compiler vectorization, use the "`-no-vec -no-simd`" (Linux* and macOS) or "`/Qvec- /Qsimd-`" (Windows*) compiler options. The option `-no-vec` (and `/Qvec-`) disables all auto-vectorization, including vectorization of array notation statements. The option `-no-simd` (and `/Qsimd-`) disables vectorization of loops that have simd pragmas.

> **NOTE**
> If you specify option `-mia32` (Linux*) or option `/arch:IA32` (Windows*), simd pragmas are disabled by default and vector instructions cannot be used. Therefore, you cannot explicitly enable SIMD pragmas by specifying option `[Q]simd`.

IDE Equivalent

None

Alternate Options

None

See Also

`vec, Qvec` compiler option
Function Annotations and the SIMD Directive for Vectorization
simd pragma

simd-function-pointers, Qsimd-function-pointers

Enables or disables pointers to simd-enabled functions.

Syntax

Linux OS and macOS:

`-simd-function-pointers`

`-no-simd-function-pointers`

Windows OS:

`/Qsimd-function-pointers`

`/Qsimd-function-pointers-`

Arguments

None

Default

`-no-simd-function-pointers` or `/Qsimd-function-pointers-`	Pointers to simd-enabled functions are disabled. Vector specifications can only be placed in function declarations and definitions.

Description

This option enables or disables pointers to simd-enabled functions.

When option `[Q]simd-function-pointers` is specified, it defines simd-enabled (vector) function pointers by placing vector specifications with all usual clauses in function pointer declarations. The vector specifications must be indicated in an attribute vector declaration or in pragma `omp declare simd`.

These pointers can enable indirect calls to appropriate vector versions of the function from a simd loop or another simd-enabled function.

IDE Equivalent

None

Alternate Options

None

unroll, Qunroll

Tells the compiler the maximum number of times to unroll loops.

Syntax

Linux OS:

`-unroll[=n]`

macOS:

`-unroll[=n]`

Windows OS:

`/Qunroll[:n]`

Arguments

n	Is the maximum number of times a loop can be unrolled. To disable loop enrolling, specify 0.

Default

`-unroll` or `/Qunroll`	The compiler uses default heuristics when unrolling loops.

Description

This option tells the compiler the maximum number of times to unroll loops.

If you do not specify *n*, the optimizer determines how many times loops can be unrolled.

IDE Equivalent

Windows

Visual Studio: **Optimization > Loop Unrolling**

Linux

Eclipse: **Optimization > Loop Unroll Count**

OS X

Xcode: **Optimization > Loop Unrolling**

Alternate Options

Linux and macOS: `-funroll-loops`

Windows: None

unroll-aggressive, Qunroll-aggressive

Determines whether the compiler uses more aggressive unrolling for certain loops.

Syntax

Linux OS:

`-unroll-aggressive`

`-no-unroll-aggressive`

macOS:

`-unroll-aggressive`

`-no-unroll-aggressive`

Windows OS:

`/Qunroll-aggressive`

`/Qunroll-aggressive-`

Arguments

None

Default

`-no-unroll-aggressive` or `/Qunroll-aggressive-`	The compiler uses default heuristics when unrolling loops.

Description

This option determines whether the compiler uses more aggressive unrolling for certain loops. The positive form of the option may improve performance.

This option enables aggressive, complete unrolling for loops with small constant trip counts.

IDE Equivalent

None

Alternate Options

None

use-intel-optimized-headers, Quse-intel-optimized-headers

Determines whether the performance headers directory is added to the include path search list.

Syntax

Linux OS:

`-use-intel-optimized-headers`

macOS:

`-use-intel-optimized-headers`

Windows OS:

`/Quse-intel-optimized-headers`

Arguments

None

Default

`-no-use-intel-optimized-headers` or `/Quse-intel-optimized-headers-`	The performance headers directory is not added to the include path search list.

Description

This option determines whether the performance headers directory is added to the include path search list.

The performance headers directory is added if you specify `[Q]use-intel-optimized-headers`. Appropriate libraries are also linked in, as needed, for proper functionality.

Product and Performance Information
Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex. Notice revision #20201201

IDE Equivalent

Intel's valarray Implementation

vec, Qvec

Enables or disables vectorization.

Syntax

Linux OS:

`-vec`

`-no-vec`

macOS:

`-vec`

`-no-vec`

Windows OS:

`/Qvec`

`/Qvec-`

Arguments

None

Default

`-vec` or `/Qvec`	Vectorization is enabled if option `O2` or higher is in effect.

Description

This option enables or disables vectorization.

To disable vectorization, specify `-no-vec` (Linux* and macOS) or `/Qvec-` (Windows*).

To disable interpretation of SIMD pragmas, specify `-no-simd` (Linux* and macOS) or `/Qsimd-` (Windows*).

To disable all compiler vectorization, use the "`-no-vec -no-simd`" (Linux* and macOS) or "`/Qvec- /Qsimd-`" (Windows*) compiler options. The option `-no-vec` (and `/Qvec-`) disables all auto-vectorization, including vectorization of array notation statements. The option `-no-simd` (and `/Qsimd-`) disables vectorization of loops that have SIMD pragmas.

> **NOTE**
> Using this option enables vectorization at default optimization levels for both Intel® microprocessors and non-Intel microprocessors. Vectorization may call library routines that can result in additional performance gain on Intel microprocessors than on non-Intel microprocessors. The vectorization can also be affected by certain options, such as `/arch` (Windows), `-m` (Linux and macOS), or `[Q]x`.

IDE Equivalent

None

Alternate Options

None

See Also

`simd, Qsimd` compiler option
`ax, Qax` compiler option
`x, Qx` compiler option
`vec-guard-write, Qvec-guard-write` compiler option
`vec-threshold, Qvec-threshold` compiler option

vec-guard-write, Qvec-guard-write

Tells the compiler to perform a conditional check in a vectorized loop.

Syntax

Linux OS:

`-vec-guard-write`

`-no-vec-guard-write`

macOS:

`-vec-guard-write`

`-no-vec-guard-write`

Windows OS:

`/Qvec-guard-write`

`/Qvec-guard-write-`

Arguments

None

Default

`-vec-guard-write` or `/Qvec-guard-write`	The compiler performs a conditional check in a vectorized loop.

Description

This option tells the compiler to perform a conditional check in a vectorized loop. This checking avoids unnecessary stores and may improve performance.

IDE Equivalent

None

Alternate Options

None

vec-threshold, Qvec-threshold

Sets a threshold for the vectorization of loops.

Syntax

Linux OS:

`-vec-threshold[n]`

macOS:

`-vec-threshold[n]`

Windows OS:

`/Qvec-threshold[[:]n]`

Arguments

n	Is an integer whose value is the threshold for the vectorization of loops. Possible values are 0 through 100. If *n* is 0, loops get vectorized always, regardless of computation work volume. If *n* is 100, loops get vectorized when performance gains are predicted based on the compiler analysis data. Loops get vectorized only if profitable vector-level parallel execution is almost certain. The intermediate 1 to 99 values represent the percentage probability for profitable speed-up. For example, *n*=50 directs the compiler to vectorize only if there is a 50% probability of the code speeding up if executed in vector form.

Default

`-vec-threshold100` or `/Qvec-threshold100`	Loops get vectorized only if profitable vector-level parallel execution is almost certain. This is also the default if you do not specify *n*.

Description

This option sets a threshold for the vectorization of loops based on the probability of profitable execution of the vectorized loop in parallel.

This option is useful for loops whose computation work volume cannot be determined at compile-time. The threshold is usually relevant when the loop trip count is unknown at compile-time.

The compiler applies a heuristic that tries to balance the overhead of creating multiple threads versus the amount of work available to be shared amongst the threads.

IDE Equivalent

Windows

Visual Studio: **Optimization > Threshold For Vectorization**

Linux

Eclipse: **Optimization > Enable Maximum Vector-level Parallelism**

OS X

Xcode: **Optimization > Enable Maximum Vector-level Parallelism**

Alternate Options

None

vecabi, Qvecabi

Determines which vector function application binary interface (ABI) the compiler uses to create or call vector functions.

Syntax

Linux OS and macOS:

`-vecabi=`*`keyword`*

Windows OS:

`/Qvecabi:`*`keyword`*

Arguments

keyword	Specifies which vector function ABI to use. Possible values are:	
	`compat`	Tells the compiler to use the compatibility vector function ABI. This ABI includes Intel®-specific features.
	`cmdtarget`	Tells the compiler to generate an extended set of vector functions. The option is very similar to setting `compat`. However, for `compat`, only one vector function is created, while for `cmdtarget`, several vector functions are created for each vector specification. Vector variants are created for targets specified by compiler options `[Q]x` and/or `[Q]ax`. No change is made to the source code.
	`gcc`	Tells the compiler to use the gcc vector function ABI. Use this setting only in cases when you want to link with modules compiled by gcc. This setting is not available on Windows* systems.
	`legacy`	Tells the compiler to use the legacy vector function ABI. Use this setting if you need to keep the generated vector function binary backward compatible with the vectorized binary generated by older versions of the Intel® compilers (V13.1 or older).

Default

compat	The compiler uses the compatibility vector function ABI.

Description

This option determines which vector function application binary interface (ABI) the compiler uses to create or call vector functions.

NOTE
To avoid possible link-time and run-time errors, use identical `[Q]vecabi` settings when compiling all files in an application that define or use vector functions, including libraries. If setting `cmdtarget` is specified, options `[Q]x` and/or `[Q]ax` must have identical values.

Be careful using setting `cmdtarget` with libraries or program modules/routines with vector function definitions that cannot be recompiled. In such cases, setting `cmdtarget` may cause link errors.

On Linux* systems, since the default is `compat`, you must specify `legacy` if you need to keep the generated vector function binary backward compatible with the vectorized binary generated by the previous version of Intel® compilers.

When `cmdtarget` is specified, the additional vector function versions are created by copying each vector specification and changing target processor in the copy. The number of vector functions is determined by the settings specified in options `[Q]x` and/or `[Q]ax`.

For example, suppose we have the following function declaration:

```
__declspec (vector(processor(core_2_duo_sse4_1))) int foo(int a);
```

and the following options are specified: `-axAVX,CORE-AVX2`

The following table shows the different results for the above declaration and option specifications when setting `compat` or setting `cmdtarget` is used:

compat	cmdtarget
One vector version is created for Intel® SSE4.1 (by vector function specification).	Four vector versions are created for the following targets: • Intel® SSE2 (default because no `-x` option is used) • Intel® SSE4.1 (by vector function specification) • Intel® AVX (by the first `-ax` option value) • Intel® AVX2 (by the second `-ax` option value)

For more information about the Intel®-compatible vector functions ABI, see the downloadable PDF titled Vector Function Application Binary Interface.

For more information about the GCC vector functions ABI, see the item Libmvec - vector math library document in the GLIBC wiki at sourceware.org.

Profile Guided Optimization Options

This section contains descriptions for compiler options that pertain to profile-guided optimization.

finstrument-functions, Qinstrument-functions

Determines whether function entry and exit points are instrumented.

Syntax

Linux OS:

`-finstrument-functions`

`-fno-instrument-functions`

macOS:

`-finstrument-functions`

`-fno-instrument-functions`

Windows OS:

`/Qinstrument-functions`

`/Qinstrument-functions-`

Arguments

None

Default

`-fno-instrument-functions` or `/Qinstrument-functions-`	Function entry and exit points are not instrumented.

Description

This option determines whether function entry and exit points are instrumented. It may increase execution time.

The following profiling functions are called with the address of the current function and the address of where the function was called (its "call site"):

- This function is called upon function entry:

```
void __cyg_profile_func_enter (void *this_fn,

void *call_site);
```

- This function is called upon function exit:

```
void __cyg_profile_func_exit (void *this_fn,

void *call_site);
```

These functions can be used to gather more information, such as profiling information or timing information. Note that it is the user's responsibility to provide these profiling functions.

If you specify `-finstrument-functions` (Linux* and macOS) or `/Qinstrument-functions` (Windows*), function inlining is disabled. If you specify `-fno-instrument-functions` or `/Qinstrument-functions-`, inlining is not disabled.

On Linux and macOS systems, you can use the following attribute to stop an individual function from being instrumented:

```
__attribute__((__no_instrument_function__))
```

It also stops inlining from being disabled for that individual function.

This option is provided for compatibility with gcc.

IDE Equivalent

None

Alternate Options

None

fnsplit, Qfnsplit

Enables function splitting.

Syntax

Linux OS:

`-fnsplit[=n]`

`-no-fnsplit`

macOS:

None

Windows OS:

`/Qfnsplit[:n]`

`/Qfnsplit-`

Arguments

n	Is an optional positive integer indicating the threshold number. The blocks can be placed into a different code segment if they are only reachable via a conditional branch whose taken probability is less than the specified *n*. Branch taken probability is heuristically calculated by the compiler and can be observed in assembly listings. The range for *n* is 0 <= n <= 100.

Default

OFF	Function splitting is not enabled. However, function grouping is still enabled.

Description

This option enables function splitting. If you specify `[Q]fnsplit` with no *n*, you must also specify option `[Q]prof-use`, or the option will have no effect and no function splitting will occur.

If you specify *n*, function splitting is enabled and you do not need to specify option `[Q]prof-use`.

To disable function splitting when you use option `[Q]prof-use`, specify `/Qfnsplit-` (Windows*) or `-no-fnsplit` (Linux*).

NOTE
Function splitting is generally not supported when exception handling is turned on for C/C++ routines in the stack of called routines. See also `-fexceptions` (Linux*) and the C/C++ option `/EH` (Windows*).

p

Compiles and links for function profiling with gprof(1).

Syntax

Linux OS:

`-p`

macOS:

`-p`

Windows OS:

`None`

Arguments

None

Default

OFF	Files are compiled and linked without profiling.

Description

This option compiles and links for function profiling with gprof(1).

When you specify this option, inlining is disabled. However, you can override this by specifying pragma forceinline, declspec forceinline (Windows*), attribute always_inline (Linux* and macOS), or a compiler option such as `[Q]inline-forceinline`.

IDE Equivalent

None

Alternate Options

Linux and macOS: `-qp` (this is a deprecated option)

Windows: None

prof-data-order, Qprof-data-order

Enables or disables data ordering if profiling information is enabled.

Syntax

Linux OS:

`-prof-data-order`

`-no-prof-data-order`

macOS:

None

Windows OS:

`/Qprof-data-order`

`/Qprof-data-order-`

Arguments

None

Default

`-no-prof-data-order` or `/Qprof-data-order-`	Data ordering is disabled.

Description

This option enables or disables data ordering if profiling information is enabled. It controls the use of profiling information to order static program data items.

For this option to be effective, you must do the following:

- For instrumentation compilation, you must specify option `[Q]prof-gen setting globdata`.
- For feedback compilation, you must specify the `[Q]prof-use` option. You must not use multi-file optimization by specifying options such as `[Q]ipo` or `[Q]ipo-c`.

IDE Equivalent

None

Alternate Options

None

See Also

prof-gen, Qprof-gen compiler option
prof-use, Qprof-use compiler option
prof-func-order, Qprof-func-order compiler option

prof-dir, Qprof-dir

Specifies a directory for profiling information output files.

Syntax

Linux OS:

`-prof-dir dir`

macOS:

`-prof-dir dir`

Windows OS:

`/Qprof-dir:dir`

Arguments

dir	Is the name of the directory. You can specify a relative pathname or an absolute pathname.

Default

OFF	Profiling output files are placed in the directory where the program is compiled.

Description

This option specifies a directory for profiling information output files (*.dyn and *.dpi). The specified directory must already exist.

You should specify this option using the same directory name for both instrumentation and feedback compilations. If you move the .dyn files, you need to specify the new path.

Option `/Qprof-dir` is equivalent to option `/Qcov-dir`. If you specify both options, the last option specified on the command line takes precedence.

IDE Equivalent

Windows

Visual Studio: **General > Profile Directory**

Linux

Eclipse: **Optimization > Profile Directory**

OS X

Xcode: None

Alternate Options

None

prof-file, Qprof-file

Specifies an alternate file name for the profiling summary files.

Syntax

Linux OS:

`-prof-file` *`filename`*

macOS:

`-prof-file` *`filename`*

Windows OS:

`/Qprof-file:`*`filename`*

Arguments

filename	Is the name of the profiling summary file.

Default

OFF	The profiling summary files have the file name pgopti.*

Description

This option specifies an alternate file name for the profiling summary files. The *filename* is used as the base name for files created by different profiling passes.

If you add this option to profmerge, the .dpi file will be named *filename*.dpi instead of pgopti.dpi.

If you specify this option with option `[Q]prof-use`, the .dpi file will be named *filename*.dpi instead of pgopti.dpi.

Option `/Qprof-file` is equivalent to option `/Qcov-file`. If you specify both options, the last option specified on the command line takes precedence.

> **NOTE**
> When you use option `[Q]prof-file`, you can only specify a file name. If you want to specify a path (relative or absolute) for *filename*, you must also use option `[Q]prof-dir`.

IDE Equivalent

None

Alternate Options

None

See Also

`prof-gen, Qprof-gen` compiler option

`prof-use, Qprof-use` compiler option

`prof-dir, Qprof-dir` compiler option

prof-func-groups

Enables or disables function grouping if profiling information is enabled.

Syntax

Linux OS:

`-prof-func-groups`

`-no-prof-func-groups`

macOS:

None

Windows OS:

None

Arguments

None

Default

`-no-prof-func-groups`	Function grouping is disabled.

Description

This option enables or disables function grouping if profiling information is enabled.

A "function grouping" is a profiling optimization in which entire routines are placed either in the cold code section or the hot code section.

If profiling information is enabled by option `-prof-use`, option `-prof-func-groups` is set and function grouping is enabled. However, if you explicitly enable `-prof-func-order`, function ordering is performed instead of function grouping.

If you want to disable function grouping when profiling information is enabled, specify `-no-prof-func-groups`.

To set the hotness threshold for function grouping, use option `-prof-hotness-threshold`.

IDE Equivalent

None

See Also

`prof-use, Qprof-use` compiler option

`prof-func-order, Qprof-func-order`
compiler option

`prof-hotness-threshold, Qprof-hotness-threshold`
compiler option

prof-func-order, Qprof-func-order

Enables or disables function ordering if profiling information is enabled.

Syntax

Linux OS:

`-prof-func-order`

`-no-prof-func-order`

macOS:

None

Windows OS:

`/Qprof-func-order`

`/Qprof-func-order-`

Arguments

None

Default

`-no-prof-func-order` or `/Qprof-func-order-`	Function ordering is disabled.

Description

This option enables or disables function ordering if profiling information is enabled.

For this option to be effective, you must do the following:

- For instrumentation compilation, you must specify option `[Q]prof-gen setting srcpos`.
- For feedback compilation, you must specify `[Q]prof-use`. You must not use multi-file optimization by specifying options such as `[Q]ipo` or `[Q]ipo-c`.

If you enable profiling information by specifying option `[Q]prof-use`, option `[Q]prof-func-groups` is set and function grouping is enabled. However, if you explicitly enable the `[Q]prof-func-order` option, function ordering is performed instead of function grouping.

On Linux* systems, this option is only available for Linux linker 2.15.94.0.1, or later.

To set the hotness threshold for function grouping and function ordering, use option `[Q]prof-hotness-threshold`.

IDE Equivalent

None

Alternate Options

None

Example

The following example shows how to use this option on a Windows system:

```
icl /Qprof-gen:globdata file1.c file2.c /Fe instrumented.exe
    ./instrumented.exe
icl /Qprof-use /Qprof-func-order file1.c file2.c /Fe feedback.exe
```

The following example shows how to use this option on a Linux system:

```
icc -prof-gen:globdata file1.c file2.c -o instrumented
    ./instrumented.exe
icc -prof-use -prof-func-order file1.c file2.c -o feedback
```

`prof-func-groups` compiler option

prof-gen, Qprof-gen

Produces an instrumented object file that can be used in profile guided optimization.

Syntax

Linux OS:

`-prof-gen[=`*keyword*`[, `*keyword*`],...]`

`-no-prof-gen`

macOS:

`-prof-gen[=`*keyword*`[, `*keyword*`],...]`

`-no-prof-gen`

Windows OS:

`/Qprof-gen[:`*keyword*`[,`*keyword*`],...]`

`/Qprof-gen-`

Arguments

keyword — Specifies details for the instrumented file. Possible values are:

`default`	Produces an instrumented object file. This is the same as specifying the `[Q]prof-gen` option with no keyword.
`srcpos`	Produces an instrumented object file that includes extra source position information.
`globdata`	Produces an instrumented object file that includes information for global data layout.

[no]threadsafe	Produces an instrumented object file that includes the collection of PGO data on applications that use a high level of parallelism. If [Q]prof-gen is specified with no keyword, the default is nothreadsafe.

Default

-no-prof-gen or /Qprof-gen-	Profile generation is disabled.

Description

This option produces an instrumented object file that can be used in profile guided optimization. It gets the execution count of each basic block.

You can specify more than one setting for [Q]prof-gen. For example, you can specify the following:

```
-prof-gen=srcpos -prof-gen=threadsafe (Linux* and macOS)
-prof-gen=srcpos, threadsafe (this is equivalent to the above)
```

```
/Qprof-gen:srcpos /Qprof-gen:threadsafe (Windows*)
/Qprof-gen:srcpos, threadsafe (this is equivalent to the above)
```

If you specify keyword srcpos or globdata, a static profile information file (.spi) is created. These settings may increase the time needed to do a parallel build using -prof-gen, because of contention writing the .spi file.

These options are used in phase 1 of the Profile Guided Optimizer (PGO) to instruct the compiler to produce instrumented code in your object files in preparation for instrumented execution.

When the [Q]prof-gen option is used to produce an instrumented binary file for profile generation, some optimizations are disabled. Those optimizations are not disabled for any subsequent profile-guided compilation with option [Q]prof-use that makes use of the generated profiles.

IDE Equivalent

Windows

Visual Studio: **General > Profile Guided Optimization**

General > Code Coverage Build Options

Linux

Eclipse: **Optimization > Profile Guided Optimization**

OS X

Xcode: None

Alternate Options

None

See Also

prof-use, Qprof-use compiler option
Profile an Application with Instrumentation

prof-gen-sampling

Tells the compiler to generate debug discriminators in debug output. This aids in developing more precise sampled profiling output. This is a deprecated option that may be removed in a future release.

Syntax

Linux OS:

`-prof-gen-sampling`

macOS:

None

Windows OS:

None

Arguments

None

Default

OFF	The compiler does not generate debug discriminators in the debug output.

Description

This option tells the compiler to generate debug discriminators in debug output. Debug discriminators are used to distinguish code from different basic blocks that have the same source position information. This aids in developing more precise sampled hardware profiling output.

This is a deprecated option that may be removed in a future release. There is no replacement option.

To build an executable suitable for generating hardware profiled sampled output, compile with the following options:

```
-prof-gen-sampling -g
```

To use the data files produced by hardware profiling, compile with option `-prof-use-sampling`.

IDE Equivalent

None

Alternate Options

None

See Also

prof-use-sampling compiler option
g compiler option
Profile an Application with Instrumentation

prof-hotness-threshold, Qprof-hotness-threshold

Lets you set the hotness threshold for function grouping and function ordering.

Syntax

Linux OS:

`-prof-hotness-threshold=n`

macOS:

None

Windows OS:

`/Qprof-hotness-threshold:n`

Arguments

n	Is the hotness threshold. *n* is a percentage having a value between 0 and 100 inclusive. If you specify 0, there will be no hotness threshold setting in effect for function grouping and function ordering.

Default

OFF	The compiler's default hotness threshold setting of 10 percent is in effect for function grouping and function ordering.

Description

This option lets you set the hotness threshold for function grouping and function ordering.

The "hotness threshold" is the percentage of functions in the application that should be placed in the application's hot region. The hot region is the most frequently executed part of the application. By grouping these functions together into one hot region, they have a greater probability of remaining resident in the instruction cache. This can enhance the application's performance.

For this option to take effect, you must specify option `[Q]prof-use` and one of the following:

- On Linux systems: `-prof-func-groups` or `-prof-func-order`
- On Windows systems: `/Qprof-func-order`

IDE Equivalent

None

Alternate Options

None

See Also

prof-use, Qprof-use compiler option

prof-src-dir, Qprof-src-dir

Determines whether directory information of the source file under compilation is considered when looking up profile data records.

Syntax

Linux OS:

`-prof-src-dir`

`-no-prof-src-dir`

macOS:

`-prof-src-dir`

`-no-prof-src-dir`

Windows OS:

`/Qprof-src-dir`

`/Qprof-src-dir-`

Arguments

None

Default

[Q]prof-src-dir	Directory information is used when looking up profile data records in the .dpi file.

Description

This option determines whether directory information of the source file under compilation is considered when looking up profile data records in the .dpi file. To use this option, you must also specify the `[Q]prof-use` option.

If the option is enabled, directory information is considered when looking up the profile data records within the .dpi file. You can specify directory information by using one of the following options:

- Linux and macOS: `-prof-src-root` or `-prof-src-root-cwd`
- Windows: `/Qprof-src-root` or `/Qprof-src-root-cwd`

If the option is disabled, directory information is ignored and only the name of the file is used to find the profile data record.

Note that option `[Q]prof-src-dir` controls how the names of the user's source files get represented within the .dyn or .dpi files. Option `[Q]prof-dir` specifies the location of the .dyn or the .dpi files.

IDE Equivalent

None

Alternate Options

None

See Also

`prof-use, Qprof-use` compiler option

`prof-src-root, Qprof-src-root` compiler option

`prof-src-root-cwd, Qprof-src-root-cwd` compiler option

prof-src-root, Qprof-src-root

Lets you use relative directory paths when looking up profile data and specifies a directory as the base.

Syntax

Linux OS:

`-prof-src-root=dir`

macOS:

`-prof-src-root=dir`

Windows OS:

`/Qprof-src-root:dir`

Arguments

dir	Is the base for the relative paths.

Default

OFF	The setting of relevant options determines the path used when looking up profile data records.

Description

This option lets you use relative directory paths when looking up profile data in .dpi files. It lets you specify a directory as the base. The paths are relative to a base directory specified during the `[Q]prof-gen` compilation phase.

This option is available during the following phases of compilation:

- Linux* and macOS systems: `-prof-gen` and `-prof-use` phases
- Windows* systems: `/Qprof-gen` and `/Qprof-use` phases

When this option is specified during the `[Q]prof-gen` phase, it stores information into the .dyn or .dpi file. Then, when .dyn files are merged together or the .dpi file is loaded, only the directory information below the root directory is used for forming the lookup key.

When this option is specified during the `[Q]prof-use` phase, it specifies a root directory that replaces the root directory specified at the `[Q]prof-gen` phase for forming the lookup keys.

To be effective, this option or option `[Q]prof-src-root-cwd` must be specified during the `[Q]prof-gen` phase. In addition, if one of these options is not specified, absolute paths are used in the .dpi file.

IDE Equivalent

None

Alternate Options

None

Example

Consider the initial [Q]prof-gen compilation of the source file c:\user1\feature_foo\myproject\common\glob.c shown below:

```
Windows*: icl /Qprof-gen /Qprof-src-root=c:\user1\feature_foo\myproject -c common\glob.c
```

```
Linux* and macOS: icc -prof-gen -prof-src-root=c:\user1\feature_foo\myproject -c common\glob.c
```

For the [Q]prof-use phase, the file glob.c could be moved into the directory c:\user2\feature_bar\myproject\common\glob.c and profile information would be found from the .dpi when using the following:

```
Windows*: icl /Qprof-use /Qprof-src-root=c:\user2\feature_bar\myproject -c common\glob.c
```

```
Linux* and macOS: icc -prof-use -prof-src-root=c:\user2\feature_bar\myproject -c common\glob.c
```

If you do not use option [Q]prof-src-root during the [Q]prof-gen phase, by default, the [Q]prof-use compilation can only find the profile data if the file is compiled in the c:\user1\feature_foo\my_project\common directory.

prof-src-dir, Qprof-src-dir compiler option
prof-src-root-cwd, Qprof-src-root-cwd compiler option

prof-src-root-cwd, Qprof-src-root-cwd

Lets you use relative directory paths when looking up profile data and specifies the current working directory as the base.

Syntax

Linux OS:

-prof-src-root-cwd

macOS:

-prof-src-root-cwd

Windows OS:

/Qprof-src-root-cwd

Arguments

None

Default

OFF	The setting of relevant options determines the path used when looking up profile data records.

Description

This option lets you use relative directory paths when looking up profile data in .dpi files. It specifies the current working directory as the base. To use this option, you must also specify option [Q]prof-use.

This option is available during the following phases of compilation:

- Linux* and macOS systems: -prof-gen and -prof-use phases

- Windows* systems: `/Qprof-gen` and `/Qprof-use` phases

When this option is specified during the `[Q]prof-gen` phase, it stores information into the .dyn or .dpi file. Then, when .dyn files are merged together or the .dpi file is loaded, only the directory information below the root directory is used for forming the lookup key.

When this option is specified during the `[Q]prof-use` phase, it specifies a root directory that replaces the root directory specified at the `[Q]prof-gen` phase for forming the lookup keys.

To be effective, this option or option `[Q]prof-src-root` must be specified during the `[Q]prof-gen` phase. In addition, if one of these options is not specified, absolute paths are used in the .dpi file.

IDE Equivalent

None

Alternate Options

None

See Also

`prof-gen, Qprof-gen` compiler option

`prof-src-dir, Qprof-src-dir` compiler option
`prof-src-root, Qprof-src-root` compiler option

prof-use, Qprof-use

Enables the use of profiling information during optimization.

Syntax

Linux OS:

`-prof-use[=`*keyword*`]`

`-no-prof-use`

macOS:

`-prof-use[=`*keyword*`]`

`-no-prof-use`

Windows OS:

`/Qprof-use[:`*keyword*`]`

`/Qprof-use-`

Arguments

keyword	Specifies additional instructions. Possible values are:	
	`weighted`	Tells the profmerge utility to apply a weighting to the .dyn file values when creating the .dpi file to normalize the data counts when the training runs have differentexecution durations. This argument only has an effect when the compiler invokes the profmerge utility

	to create the .dpi file. This argument does not have an effect if the .dpi file was previously created without weighting.
`[no]merge`	Enables or disables automatic invocation of the profmerge utility. The default is `merge`. Note that you cannot specify both `weighted` and `nomerge`. If you try to specify both values, a warning will be displayed and `nomerge` takes precedence.
`default`	Enables the use of profiling information during optimization. The profmerge utility is invoked by default. This value is the same as specifying `[Q]prof-use` with no argument.

Default

`-no-prof-use` or `/Qprof-use-`	Profiling information is not used during optimization.

Description

This option enables the use of profiling information (including function splitting and function grouping) during optimization. It enables option /Qfnsplit (Windows*) and -fnsplit (Linux* and macOS) .

This option instructs the compiler to produce a profile-optimized executable and it merges available profiling output files into a pgopti.dpi file.

Note that there is no way to turn off function grouping if you enable it using this option.

To set the hotness threshold for function grouping and function ordering, use option `[Q]prof-hotness-threshold`.

IDE Equivalent

Windows

Visual Studio: **General > Profile Guided Optimization**

Linux

Eclipse: **Optimization > Profile Guided Optimization**

OS X

Xcode: None

Alternate Options

None

See Also

`prof-gen, Qprof-gen` compiler option

Profile an Application with Instrumentation

prof-use-sampling

Lets you use data files produced by hardware profiling to produce an optimized executable. This is a deprecated option that may be removed in a future release.

Syntax

Linux OS:

`-prof-use-sampling=`*`list`*

macOS:

None

Windows OS:

None

Arguments

list	Is a list of one or more data files. If you specify more than one data file, they must be separated by colons.

Default

OFF	Data files produced by hardware profiling will not be used to produce an optimized executable.

Description

This option lets you use data files produced by hardware profiling to produce an optimized executable.

This is a deprecated option that may be removed in a future release. There is no replacement option.

The data files are named and produced by using Intel® VTune™.

The executable should have been produced using the following options:

```
-prof-gen-sampling -g
```

IDE Equivalent

None

Alternate Options

None

See Also

prof-gen-sampling compiler option
Profile an Application with Instrumentation

prof-value-profiling, Qprof-value-profiling

Controls which values are value profiled.

Syntax

Linux OS:

`-prof-value-profiling[=keyword]`

macOS:

`-prof-value-profiling[=keyword]`

Windows OS:

`/Qprof-value-profiling[:keyword]`

Arguments

keyword	Controls which type of value profiling is performed. Possible values are:	
	`none`	Prevents all types of value profiling.
	`nodivide`	Prevents value profiling of non-compile time constants used in division or remainder operations.
	`noindcall`	Prevents value profiling of function addresses at indirect call sites.
	`all`	Enables all types of value profiling.

You can specify more than one keyword, but they must be separated by commas.

Default

`all`	All value profile types are enabled and value profiling is performed.

Description

This option controls which features are value profiled.

If this option is specified with option `[Q]prof-gen`, it turns off instrumentation of operations of the specified type. This also prevents feedback of values for the operations.

If this option is specified with option `[Q]prof-use`, it turns off feedback of values collected of the specified type.

If you specify level 2 or higher for option `[q or Q]opt-report`, the value profiling specialization information will be reported within the PGO optimization report.

IDE Equivalent

None

Alternate Options

None

See Also

`qopt-report, Qopt-report` compiler option

Qcov-dir

Specifies a directory for profiling information output files that can be used with the codecov or tselect tool.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Qcov-dir:`*`dir`*

Arguments

dir	Is the name of the directory.

Default

OFF	Profiling output files are placed in the directory where the program is compiled.

Description

This option specifies a directory for profiling information output files (*.dyn and *.dpi) that can be used with the code-coverage tool (codecov) or the test prioritization tool (tselect). The specified directory must already exist.

You should specify this option using the same directory name for both instrumentation and feedback compilations. If you move the .dyn files, you need to specify the new path.

Option `/Qcov-dir` is equivalent to option `/Qprof-dir`. If you specify both options, the last option specified on the command line takes precedence.

IDE Equivalent

None

Alternate Options

None

See Also

Qcov-gen compiler option
Qcov-file compiler option

Qcov-file

Specifies an alternate file name for the profiling summary files that can be used with the codecov or tselect tool.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Qcov-file:`*`filename`*

Arguments

filename	Is the name of the profiling summary file.

Default

OFF	The profiling summary files have the file name pgopti.*.

Description

This option specifies an alternate file name for the profiling summary files. The file name can be used with the code-coverage tool (codecov) or the test prioritization tool (tselect).

The *filename* is used as the base name for the set of files created by different profiling passes.

If you specify this option with option `/Qcov-gen`, the .spi and .spl files will be named *filename*.spi and *filename*.spl instead of pgopti.spi and pgopti.spl.

Option `/Qcov-file` is equivalent to option `/Qprof-file`. If you specify both options, the last option specified on the command line takes precedence.

IDE Equivalent

None

Alternate Options

None

See Also

Qcov-gen compiler option
Qcov-dir compiler option

Qcov-gen

Produces an instrumented object file that can be used with the codecov or tselect tool.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Qcov-gen`

`/Qcov-gen-`

Arguments

None

Default

`/Qcov-gen-`	The instrumented object file is not produced.

Description

This option produces an instrumented object file that can be used with the code-coverage tool (codecov) or the test prioritization tool (tselect). The instrumented code is included in the object file in preparation for instrumented execution.

This option also creates a static profile information file (.spi) that can be used with the codecov or tselect tool.

Option `/Qcov-gen` should be used to minimize the instrumentation overhead if you are interested in using the instrumentation only for code coverage. You should use `/Qprof-gen:srcpos` if you intend to use the collected data for code coverage and profile feedback.

IDE Equivalent

Windows

Visual Studio: **General > Code Coverage Build Options**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

See Also

Qcov-file compiler option

Optimization Report Options

This section contains descriptions for compiler options that pertain to optimization reports.

qopt-report, Qopt-report

Tells the compiler to generate an optimization report.

Syntax

Linux OS:

`-qopt-report[=n]`

macOS:

`-qopt-report[=n]`

Windows OS:

`/Qopt-report[:n]`

Arguments

n	(Optional) Indicates the level of detail in the report. You can specify values 0 through 5. If you specify zero, no report is generated. For levels *n*=1 through *n*=5, each level includes all the information of the previous level, as well as potentially some additional information. Level 5 produces the greatest level of detail. If you do not specify *n*, the default is level 2, which produces a medium level of detail.

Default

OFF	No optimization report is generated.

Description

This option tells the compiler to generate a collection of optimization report files, one per object; this is the same output produced by option `[q or Q]opt-report-per-object`.

If you prefer another form of output, you can specify option `[q or Q]opt-report-file`.

If you specify a level (*n*) higher than 5, a warning will be displayed and you will get a level 5 report.

When optimization reporting is enabled, the default is `-qopt-report-phase=all` (Linux* or macOS) or `/Qopt-report-phase:all` (Windows*).

For a description of the information that each *n* level provides, see the Example section in option `[q or Q]opt-report-phase`.

IDE Equivalent

Visual Studio

Visual Studio: **Diagnostics > Optimization Diagnostic Level**

Eclipse

Eclipse: **Compilation Diagnostics > Optimization Diagnostic Level**

Xcode

Xcode: **Diagnostics > Optimization Diagnostic Level**

Alternate Options

None

Example

If you only want reports about certain diagnostics, you can use this option with option `[q or Q]opt-report-phase`. The phase you specify determines which diagnostics you will receive.

For example, the following examples show how to get reports about certain specific diagnostics.

To get this specific report	Specify
Auto-parallelizer diagnostics	Linux* or macOS: `-qopt-report -qopt-report-phase=par` Windows*: `/Qopt-report /Qopt-report-phase:par`
OpenMP parallelizer diagnostics	Linux* or macOS: `-qopt-report -qopt-report-phase=openmp` Windows*: `/Qopt-report /Qopt-report-phase:openmp`
Vectorizer diagnostics	Linux* or macOS: `-qopt-report -qopt-report-phase=vec` Windows*: `/Qopt-report /Qopt-report-phase:vec`

See Also

`qopt-report-file, Qopt-report-file` compiler option

`qopt-report-per-object, Qopt-report-per-object` compiler option

`qopt-report-phase, Qopt-report-phase` compiler option

qopt-report-annotate, Qopt-report-annotate

Enables the annotated source listing feature and specifies its format.

Syntax

Linux OS:

`-qopt-report-annotate[=`*`keyword`*`]`

macOS:

`-qopt-report-annotate[=`*`keyword`*`]`

Windows OS:

`/Qopt-report-annotate[:`*`keyword`*`]`

Arguments

`keyword` Specifies the format for the annotated source listing. You can specify one of the following:

`text`	Indicates that the listing should be in text format. This is the default if you do not specify *keyword*.
`html`	Indicates that the listing should be in html format.

Default

OFF	No annotated source listing is generated

Description

This option enables the annotated source listing feature and specifies its format. The feature annotates source files with compiler optimization reports.

By default, one annotated source file is output per object. The annotated file is written to the same directory where the object files are generated. If the object file is a temporary file and an executable is generated, annotated files are placed in the directory where the executable is placed. You cannot generate annotated files to a directory of your choosing.

However, you can output annotated listings to stdout, stderr, or to a file if you also specify option `[q or Q]opt-report-file`.

By default, this option sets option `[q or Q]opt-report` with default level 2.

The following shows the file extension and listing details for the two possible *keyword*s.

Format	Listing Details
`text`	The annotated source listing has an .annot extension. It includes line numbers and compiler diagnostics placed after correspondent lines. IPO footnotes are inserted at the end of annotated file.
`html`	The annotated source listing has an .annot.html extension. It includes line numbers and compiler diagnostics placed after correspondent lines (as the text format does). It also provides hyperlinks in compiler messages and quick navigation with the routine list. IPO footnotes are displayed as tooltips.

`qopt-report, Qopt-report` compiler option

`qopt-report-file, Qopt-report-file` compiler option

`qopt-report-annotate-position, Qopt-report-annotate-position` compiler option

qopt-report-annotate-position, Qopt-report-annotate-position

Enables the annotated source listing feature and specifies the site where optimization messages appear in the annotated source in inlined cases of loop optimizations.

Syntax

Linux OS:

`-qopt-report-annotate-position=`*`keyword`*

macOS:

`-qopt-report-annotate-position=`*`keyword`*

Windows OS:

`/Qopt-report-annotate-position:`*`keyword`*

Arguments

`keyword`	Specifies the site where optimization messages appear in the annotated source. You can specify one of the following:

`caller`	Indicates that the messages should appear in the caller site.
`callee`	Indicates that the messages should appear in the callee site.
`both`	Indicates that the messages should appear in both the caller and the callee sites.

Default

OFF	No annotated source listing is generated

Description

This option enables the annotated source listing feature and specifies the site where optimization messages appear in the annotated source in inlined cases of loop optimizations.

This option enables option `[q or Q]opt-report-annotate` if it is not explicitly specified.

If annotated source listing is enabled and this option is not passed to compiler, loop optimizations are placed in caller position by default.

IDE Equivalent

qopt-report-embed, Qopt-report-embed

Determines whether special loop information annotations will be embedded in the object file and/or the assembly file when it is generated.

Syntax

Linux OS:

`-qopt-report-embed`

`-qno-opt-report-embed`

macOS:

`-qopt-report-embed`

`-qno-opt-report-embed`

Windows OS:

`/Qopt-report-embed`

`/Qopt-report-embed-`

Arguments

None

Default

OFF	When an assembly file is being generated, special loop information annotations will not be embedded in the assembly file. However, if option `-g` (Linux* and macOS) or `/Zi` (Windows*) is specified, special loop information annotations will be embedded in the assembly file unless option `-qno-opt-report-embed` (Linux and macOS) or `/Qopt-report-embed-` (Windows) is specified.

Description

This option determines whether special loop information annotations will be embedded in the object file and/or the assembly file when it is generated. Specify the positive form of the option to include the annotations in the assembly file.

If an object file (or executable) is being generated, the annotations will be embedded in the object file (or executable).

If you use this option, you do not have to specify option `[q or Q]opt-report`.

Alternate Options

None

See Also

`qopt-report, Qopt-report` compiler option

qopt-report-file, Qopt-report-file

Specifies that the output for the optimization report goes to a file, stderr, or stdout.

Syntax

Linux OS:

`-qopt-report-file=`*`keyword`*

macOS:

`-qopt-report-file=`*`keyword`*

Windows OS:

`/Qopt-report-file:`*`keyword`*

Arguments

keyword	Specifies the output for the report. You can specify one of the following:	
	`filename`	Specifies the name of the file where the output should go.
	`stderr`	Indicates that the output should go to stderr.
	`stdout`	Indicates that the output should go to stdout.

Default

OFF	No optimization report is generated.

Description

This option specifies that the output for the optimization report goes to a file, stderr, or stdout.

If you use this option, you do not have to specify option `[q or Q]opt-report`.

When optimization reporting is enabled, the default is `-qopt-report-phase=all` (Linux* and macOS) or `/Qopt-report-phase:all` (Windows*).

IDE Equivalent

Visual Studio

Visual Studio: **Diagnostics > Optimization Diagnostic File**

Diagnostics > Emit Optimization Diagnostic to File

Eclipse

Eclipse: **Compilation Diagnostics > Emit Optimization Diagnostics to File**

Compilation Diagnostics > Optimization Diagnostics File

Xcode

Xcode: None

Alternate Options

None

See Also

`qopt-report, Qopt-report` compiler option

qopt-report-filter, Qopt-report-filter

Tells the compiler to find the indicated parts of your application, and generate optimization reports for those parts of your application.

Syntax

Linux OS:

`-qopt-report-filter=`*`string`*

macOS:

`-qopt-report-filter=`*`string`*

Windows OS:

`/Qopt-report-filter:`*`string`*

Arguments

string Is the information to search for. The *string* must appear within quotes. It can take one or more of the following forms:

filename
filename, *routine*
filename, *range* [, *range*]...

filename, *routine*, *range* [, *range*]...

If you specify more than one of the above forms in a string, a semicolon must appear between each form. If you specify more than one *range* in a string, a comma must appear between each *range*. Optional blanks can follow each parameter in the forms above and they can also follow each form in a string.

filename	Specifies the name of a file to be found. It can include a path. If you do not specify a path, the compiler looks for the filename in the current working directory.
routine	Specifies the name of a routine to be found. You can include an identifying parameter. The name, including any parameter, must be enclosed in single quotes. The compiler tries to uniquely identify the routine that corresponds to the specified routine name. It may select multiple routines to analyze, especially if more than one routine has the specified routine name, so the routine cannot be uniquely identified.
range	Specifies a range of line numbers to be found in the file or routine specified. The *range* must be specified in integers in the form: *first_line_number-last_line_number* The hyphen between the line numbers is required.

Default

OFF	No optimization report is generated.

Description

This option tells the compiler to find the indicated parts of your application, and generate optimization reports for those parts of your application. Optimization reports will only be generated for the routines that contain the specified *string*.

On Linux* and macOS, if you specify both `-qopt-report-routine=string1` and `-qopt-report-filter=string2`, it is treated as `-qopt-report-filter=string1;string2`. On Windows*, if you specify both `/Qopt-report-routine:string1` and `/Qopt-report-filter:string2`, it is treated as`/Qopt-report-filter:string1;string2`.

If you use this option, you do not have to specify option `[q or Q]opt-report`.

When optimization reporting is enabled, the default is `-qopt-report-phase=all` (Linux* and macOS) or `/Qopt-report-phase:all` (Windows*).

IDE Equivalent

None

Alternate Options

None

See Also

qopt-report, Qopt-report compiler option

qopt-report-format, Qopt-report-format

Specifies the format for an optimization report.

Syntax

Linux OS:

`-qopt-report-format=keyword`

macOS:

`-qopt-report-format=keyword`

Windows OS:

`/Qopt-report-format:keyword`

Arguments

keyword Specifies the format for the report. You can specify one of the following:

`text`	Indicates that the report should be in text format.
`vs`	Indicates that the report should be in Visual Studio* (IDE) format. The Visual Studio IDE uses the information to visualize the optimization report in the context of your program source code.

Default

OFF	No optimization report is generated.

Description

This option specifies the format for an optimization report. If you use this option, you must specify either `text` or `vs`.

If you do not specify this option and another option causes an optimization report to be generated, the default format is `text`.

If the `[q or Q]opt-report-file` option is also specified, it will affect where the output goes:

- If `filename` is specified, output goes to the specified file.
- If `stdout` is specified, output goes to stdout.
- If `stderr` is specified, output goes to stderr.

If you use this option, you do not have to specify option `[q or Q]opt-report`.

When optimization reporting is enabled, the default is `-qopt-report-phase=all` (Linux* and macOS) or `/Qopt-report-phase:all` (Windows*).

IDE Equivalent

None

Alternate Options

None

See Also

`qopt-report, Qopt-report` compiler option

`qopt-report-file, Qopt-report-file` compiler option

qopt-report-help, Qopt-report-help

Displays the optimizer phases available for report generation and a short description of what is reported at each level.

Syntax

Linux OS:

`-qopt-report-help`

Linux OS and macOS:

`-qopt-report-help`

Windows OS:

`/Qopt-report-help`

Arguments

None

Default

OFF	No optimization report is generated.

Description

This option displays the optimizer phases available for report generation using `[q or Q]opt-report-phase`, and a short description of what is reported at each level. No compilation is performed.

To indicate where output should go, you can specify one of the following options:

- `[q or Q]opt-report-file`
- `[q or Q]opt-report-per-object`

If you use this option, you do not have to specify option `[q or Q]opt-report`.

IDE Equivalent

None

Alternate Options

None

See Also

`qopt-report, Qopt-report` compiler option

`qopt-report-per-object, Qopt-report-per-object` compiler option

qopt-report-names, Qopt-report-names

Specifies whether mangled or unmangled names should appear in the optimization report.

Syntax

Linux OS:

`-qopt-report-names=`*`keyword`*

macOS:

`-qopt-report-names=`*`keyword`*

Windows OS:

`/Qopt-report-names:`*`keyword`*

Arguments

keyword	Specifies the form for the names. You can specify one of the following:	
	`mangled`	Indicates that the optimization report should contain mangled names.
	`unmangled`	Indicates that the optimization report should contain unmangled names.

Default

OFF	No optimization report is generated.

Description

This option specifies whether mangled or unmangled names should appear in the optimization report. If you use this option, you must specify either `mangled` or `unmangled`.

If this option is not specified, unmangled names are used by default.

If you specify `mangled`, encoding (also known as decoration) is added to names in the optimization report. This is appropriate when you want to match annotations with the assembly listing.

If you specify `unmangled`, no encoding (or decoration) is added to names in the optimization report. This is appropriate when you want to match annotations with the source listing.

If you use this option, you do not have to specify option `[q or Q]opt-report`.

When optimization reporting is enabled, the default is `-qopt-report-phase=all` (Linux* and macOS) or `/Qopt-report-phase:all` (Windows*).

IDE Equivalent

None

Alternate Options

None

See Also

`qopt-report, Qopt-report` compiler option

qopt-report-per-object, Qopt-report-per-object

Tells the compiler that optimization report information should be generated in a separate file for each object.

Syntax

Linux OS:

`-qopt-report-per-object`

macOS:

`-qopt-report-per-object`

Windows OS:

`/Qopt-report-per-object`

Arguments

None

Default

OFF	No optimization report is generated.

Description

This option tells the compiler that optimization report information should be generated in a separate file for each object.

If you specify this option for a single-file compilation, a file with a .optrpt extension is produced for every object file or assembly file that is generated by the compiler. For a multifile Interprocedural Optimization (IPO) compilation, one file is produced for each of the N true objects generated in the compilation. If only one true object file is generated, the optimization report file generated is called ipo_out.optrpt. If multiple true object files are generated (N>1), the names used are ipo_out1.optrpt, ipo_out2.optrpt, … ipo_outN.optrpt.

The .optrpt files are written to the target directory of the compilation process. If an object or assembly file is explicitly generated, the corresponding .optrpt file is written to the same directory where the object file is generated. If the object file is just a temporary file and an executable is generated, the corresponding .optrpt files are placed in the directory in which the executable is placed.

If you use this option, you do not have to specify option `[q or Q]opt-report`.

When optimization reporting is enabled, the default is `-qopt-report-phase=all` (Linux* or macOS) or `/Qopt-report-phase:all` (Windows*).

IDE Equivalent

None

Alternate Options

None

See Also

`qopt-report, Qopt-report` compiler option

qopt-report-phase, Qopt-report-phase

Specifies one or more optimizer phases for which optimization reports are generated.

Syntax

Linux OS:

`-qopt-report-phase[=list]`

macOS:

`-qopt-report-phase[=list]`

Windows OS:

`/Qopt-report-phase[:list]`

Arguments

list	(Optional) Specifies one or more phases to generate reports for. If you specify more than one phase, they must be separated with commas. The values you can specify are:

`cg`	The phase for code generation
`ipo`	The phase for Interprocedural Optimization
`loop`	The phase for loop nest optimization
`openmp`	The phase for OpenMP
`par`	The phase for auto-parallelization
`pgo`	The phase for Profile Guided Optimization
`tcollect`	The phase for trace collection
`vec`	The phase for vectorization
`all`	All optimizer phases. This is the default if you do not specify *list*.

Default

OFF	No optimization report is generated.

Description

This option specifies one or more optimizer phases for which optimization reports are generated.

For certain phases, you also need to specify other options:

- If you specify phase `cg`, you must also specify option `O1`, `O2` (default), or `O3`.
- If you specify phase `ipo`, you must also specify option `[Q]ipo`.
- If you specify phase `loop`, you must also specify option `O2` (default) or `O3`.
- If you specify phase `openmp`, you must also specify option `[q or Q]openmp`.
- If you specify phase `par`, you must also specify option `[Q]parallel`.
- If you specify phase `pgo`, you must also specify option `[Q]prof-use`.
- If you specify phase `tcollect`, you must also specify option `[Q]tcollect`.

- If you specify phase `vec`, you must also specify option `O2` (default) or `O3`. If you are interested in explicit vectorization by OpenMP* SIMD, you must also specify option `[q or Q]openmp`.

To find all phase possibilities, specify option `[q or Q]opt-report-help`.

If you use this option, you do not have to specify option `[q or Q]opt-report`.

However, if you want to get more details for each phase, specify option `[q or Q]opt-report=`*n* along with this option and indicate the level of detail you want by specifying an appropriate value for *n*. (See also the Example section below.)

When optimization reporting is enabled, the default is `-qopt-report-phase=all` (Linux* or macOS) or `/Qopt-report-phase:all` (Windows*).

IDE Equivalent

Visual Studio

Visual Studio: **Diagnostics > Optimization Diagnostic Phase**

Eclipse

Eclipse: **Compilation Diagnostics > Optimization Diagnostic Phase**

Xcode

Xcode: **Diagnostics > Optimization Diagnostic Phase**

Alternate Options

None

Example

The following shows examples of the details you may receive when you specify one of the optimizer phases and a particular level (*n*) for option `[q or Q]opt-report`. Note that details may change in future releases.

Optimizer phase	**The level specified in option `[q or Q]opt-report`**	**Description**
`cg`	1	Generates a list of which intrinsics were lowered and which memcall optimizations were performed.
`ipo`	1	For each compiled routine, generates a list of the routines that were inlined into the routine, called directly by the routine, and whose calls were deleted.
	2	Generates level 1 details, values for important inlining command line options, and a list of the routines that were discovered to be dead and eliminated.
	3	Generates level 2 details, whole program information, the sizes of inlined routines, and the reasons routines were not inlined.

Optimizer phase	The level specified in option `[q or Q]opt-report`	Description
	4	Generates level 3 details, detailed footnotes on the reasons why routines are not inlined, and what action the user can take to get them inlined.
`loop`	1	Reports high-level details about which optimizations have been performed on the loop nests (along with the line number). Most of the loop optimizations (like fusion, unroll, unroll & jam, collapsing, rerolling etc) only support this level of detail.
	2	Generates level 1 details, and provides more detail on the metrics and types of references (like prefetch distance, indirect prefetches etc) used in optimizations. Only a few optimizations (like prefetching, loop classification framework etc) support these extra details.
`openmp`	1	Reports loops, regions, sections, and tasks successfully parallelized.
	2	Generates level 1 details, and messages indicating successful handling of master constructs, single constructs, critical constructs, ordered constructs, atomic pragmas, and so forth.
`par`	1	Reports which loops were parallelized.
	2	Generates level 1 details, and reports which loops were not parallelized along with a short reason.
	3	Generates level 2 details, and prints the memory locations that are categorized as private, shared, reduction, etc..
	4	For this phase, this is the same as specifying level 3.

Optimizer phase	The level specified in option `[q or Q]opt-report`	Description
	5	Generates level 4 details, and dependency edges that inhibit parallelization.
`pgo`	1	During profile feedback, generates report status of feedback (such as, profile used, no profile available, or unable to use profile) for each routine compiled.
	2	Generates level 1 details, and reports which value profile specializations took place for indirect calls and arithmetic operations.
	3	Generates level 2 details, and reports which indirect calls had profile data, but did not meet the internal threshold limits for the percentage or execution count.
`tcollect`	1	Generates a list of routines and whether each was selected for trace collection.
`vec`	1	Reports which loops were vectorized.
	2	Generates level 1 details and reports which loops were not vectorized along with short reason.
	3	Generates level 2 details, and vectorizer loop summary information.
	4	Generates level 3 details, and greater detail about vectorized and non-vectorized loops.
	5	Generates level 4 details, and details about any proven or assumed data dependences.

`qopt-report, Qopt-report` compiler option

`qopt-report-help, Qopt-report-help` compiler option

qopt-report-routine, Qopt-report-routine

Tells the compiler to generate an optimization report for each of the routines whose names contain the specified substring.

Syntax

Linux OS:

`-qopt-report-routine=`*`substring`*

macOS:

`-qopt-report-routine=`*`substring`*

Windows OS:

`/Qopt-report-routine:`*`substring`*

Arguments

substring	Is the text (string) to look for.

Default

OFF	No optimization report is generated.

Description

This option tells the compiler to generate an optimization report for each of the routines whose names contain the specified substring.

You can also specify a sequence of substrings separated by commas. If you do this, the compiler will generate an optimization report for each of the routines whose name contains one or more of these substrings.

If you use this option, you do not have to specify option `[q or Q]opt-report`.

When optimization reporting is enabled, the default is `-qopt-report-phase=all` (Linux* and macOS) or `/Qopt-report-phase:all` (Windows*).

IDE Equivalent

Visual Studio

Visual Studio: **Diagnostics > Optimization Diagnostic Routine**

Eclipse

Eclipse: **Compilation Diagnostics > Optimization Diagnostic Routine**

Xcode

Xcode: None

OpenMP* Options and Parallel Processing Options

This section contains descriptions for compiler options that pertain to offload compilation, OpenMP*, or parallel processing.

device-math-lib

Enables or disables certain device libraries. This is a deprecated option that may be removed in a future release.

Syntax

Linux OS:

`-device-math-lib=`*`library`*

`-no-device-math-lib=`*`library`*

macOS:

None

Windows OS:

`/device-math-lib:`*`library`*

`/no-device-math-lib:`*`library`*

Arguments

library	Possible values are: `fp32` — Links the fp32 device math library. `fp64` — Links the fp64 device math library. To link more than one library, include a comma between the library names. For example, if you want to link both the fp32 and fp64 device libraries, specify: fp32, fp64

Default

fp32, fp64	Both the fp32 and fp64 device libraries are linked.

Description

This option enables or disables certain device libraries.

This is a deprecated option that may be removed in a future release. There is no replacement option.

IDE Equivalent

None

Alternate Options

None

See Also

fopenmp-device-lib compiler option

fmpc-privatize

Enables or disables privatization of all static data for the MultiProcessor Computing environment (MPC) unified parallel runtime.

Architecture Restrictions

Only available on Intel® 64 architecture

Syntax

Linux OS:

`-fmpc-privatize`

`-fno-mpc-privatize`

macOS:

`None`

Windows OS:

`None`

Arguments

None

Default

`-fno-mpc-privatize`	The privatization of all static data for the MPC unified parallel runtime is disabled.

Description

This option enables or disables privatization of all static data for the MultiProcessor Computing environment (MPC) unified parallel runtime.

Option `-fmpc-privatize` causes calls to extended thread-local-storage (TLS) resolution, run-time routines that are not supported on standard Linux* distributions.

This option requires installation of another product. For more information, see Feature Requirements.

IDE Equivalent

None

Alternate Options

None

fopenmp-device-lib

Enables or disables certain device libraries for an OpenMP target.*

Syntax

Linux OS:

`-fopenmp-device-lib=`*`library`*`[,`*`library`*`,...]`

`-fno-openmp-device-lib=`*`library`*`[,`*`library`*`,...]`

macOS:

`None`

Windows OS:

`-fopenmp-device-lib=`*`library`*`[,`*`library`*`,...]`

`-fopenmp-device-lib=`*`library`*`[,`*`library`*`,...]`

Arguments

`library`	Possible values are:	
	`libm-fp32`	Enables linking to the fp32 device math library.
	`libm-fp64`	Enables linking to the fp64 device math library.
	`libc`	Enables linking to the C library.
	`all`	Enables linking to libraries libm-fp32, libm-fp-64, and libc.
	To link more than one library, include a comma between the library names. For example, if you want to link both the libm-fp32 device library and the C library, specify: libm-fp32,libc. Do not add spaces between library names. Note that if you specify "all", it supersedes any additional value you may specify.	

Default

OFF	Disables linking to device libraries for this target.

Description

This option enables or disables certain device libraries for an OpenMP* target.

If you specify `fno-openmp-device-lib=library`, linking to the specified library is disabled for the OpenMP* target.

Alternate Options

None

par-affinity, Qpar-affinity

Specifies thread affinity.

Syntax

Linux OS:

`-par-affinity=[`*`modifier`*`,...]`*`type`*`[,`*`permute`*`][,`*`offset`*`]`

macOS:

`None`

Windows OS:

`/Qpar-affinity:[`*`modifier`*`,...]`*`type`*`[,`*`permute`*`][,`*`offset`*`]`

Arguments

modifier	Is one of the following values: `granularity={fine|thread|core|tile}`, `[no]respect`, `[no]verbose`, `[no]warnings`, `proclist=proc_list`. The default is `granularity=core, respect, and noverbose`. For information on value `proclist`, see Thread Affinity Interface.
type	Indicates the thread affinity. This argument is required and must be one of the following values: `compact`, `disabled`, `explicit`, `none`, `scatter`, `logical`, `physical`. The default is `none`. Values `logical` and `physical` are deprecated. Use `compact` and `scatter`, respectively, with no *permute* value.
permute	Is a positive integer. You cannot use this argument with *type* setting `explicit`, `none`, or `disabled`. The default is 0.
offset	Is a positive integer. You cannot use this argument with *type* setting `explicit`, `none`, or `disabled`. The default is 0.

Default

OFF	The thread affinity is determined by the run-time environment.

Description

This option specifies thread affinity, which binds threads to physical processing units. It has the same effect as environment variable KMP_AFFINITY.

This option overrides the environment variable when both are specified.

This option only has an effect if the following is true:

- You have specified option `[Q]parallel` or option `[q or Q]openmp` (or both).
- You are compiling the main program.

> **NOTE**
> This option may behave differently on Intel® microprocessors than on non-Intel microprocessors.

IDE Equivalent

None

Alternate Options

None

See Also

`parallel, Qparallel` compiler option

`qopt-report, Qopt-report` compiler option

par-loops, Qpar-loops

Lets you select between old or new implementations of parallel loop support.

Syntax

Linux OS and macOS:

`-par-loops=`*`keyword`*

Windows OS:

`/Qpar-loops:`*`keyword`*

Arguments

keyword	Specifies which implementation to use. Possible values are:	
	`new`	Enables the new implementation of parallel-loop support. As a result, parallel C++ range-based loops and collapsing complex loop stacks will not result in compilation errors. This is the default.
	`old`	Enables the old implementation of parallel-loop support. This is the same implementation that was supported in 18.0 and earlier releases.
	`default`	This is the same as specifying `new`.

Default

`-par-loops=new` or `/Qpar-loops:new`	The compiler uses the new implementation of parallel-loop support. Note that this setting may not yet be as stable as setting "old" since the implementation is new.

Description

This option lets you select between old or new implementations of parallel loop support.

The new implementation handles parallel C++ range-based loops, and also collapsing of OpenMP* parallel loops with complicated bounds expressions, for which the previous implementation reported errors.

If your code has a parallel loop that is not handled by the previous implementation, we recommend that you enable use of the new implementation.

IDE Equivalent

None

Alternate Options

None

par-num-threads, Qpar-num-threads

Specifies the number of threads to use in a parallel region.

Syntax

Linux OS:

`-par-num-threads=`*`n`*

macOS:

`-par-num-threads=`*`n`*

Windows OS:

`/Qpar-num-threads:`*`n`*

Arguments

n	Is the number of threads to use. It must be a positive integer.

Default

OFF	The number of threads to use is determined by the run-time environment.

Description

This option specifies the number of threads to use in a parallel region. It has the same effect as environment variable OMP_NUM_THREADS.

This option overrides the environment variable when both are specified.

This option only has an effect if the following is true:

- You have specified option `[Q]parallel` or option `[q or Q]openmp` (or both).
- You are compiling the main program.

IDE Equivalent

None

Alternate Options

None

See Also

`parallel, Qparallel` compiler option
`qopt-report, Qopt-report` compiler option

par-runtime-control, Qpar-runtime-control

Generates code to perform run-time checks for loops that have symbolic loop bounds.

Syntax

Linux OS:

`-par-runtime-control[`*`n`*`]`

`-no-par-runtime-control`

macOS:

`-par-runtime-control[`*`n`*`]`

`-no-par-runtime-control`

Windows OS:

`/Qpar-runtime-control[n]`

`/Qpar-runtime-control-`

Arguments

n	Is a value denoting what kind of runtime checking to perform. Possible values are:	
	`0`	Performs no runtime check based on auto-parallelization. This is the same as specifying `-no-par-runtime-control` (Linux* and macOS) or `/Qpar-runtime-control-` (Windows*).
	`1`	Generates runtime check code under conservative mode. This is the default if you do not specify *n*.
	`2`	Generates runtime check code under heuristic mode.
	`3`	Generates runtime check code under aggressive mode.

Default

`-no-par-runtime-control` or `/Qpar-runtime-control-`	The compiler uses default heuristics when checking loops.

Description

This option generates code to perform run-time checks for loops that have symbolic loop bounds.

If the granularity of a loop is greater than the parallelization threshold, the loop will be executed in parallel.

If you do not specify this option, the compiler may not parallelize loops with symbolic loop bounds if the compile-time granularity estimation of a loop can not ensure it is beneficial to parallelize the loop.

NOTE
This option may behave differently on Intel® microprocessors than on non-Intel microprocessors.

IDE Equivalent

None

Alternate Options

None

par-schedule, Qpar-schedule

Lets you specify a scheduling algorithm for loop iterations.

Syntax

Linux OS:

`-par-schedule-keyword[=n]`

macOS:

`-par-schedule-keyword[=n]`

Windows OS:

`/Qpar-schedule-keyword[[:]n]`

Arguments

keyword Specifies the scheduling algorithm or tuning method. Possible values are:

`auto`	Lets the compiler or run-time system determine the scheduling algorithm.
`static`	Divides iterations into contiguous pieces.
`static-balanced`	Divides iterations into even-sized chunks.
`static-steal`	Divides iterations into even-sized chunks, but allows threads to steal parts of chunks from neighboring threads.
`dynamic`	Gets a set of iterations dynamically.
`guided`	Specifies a minimum number of iterations.
`guided-analytical`	Divides iterations by using exponential distribution or dynamic distribution.
`runtime`	Defers the scheduling decision until run time.

n Is the size of the chunk or the number of iterations for each chunk. This setting can only be specified for static, dynamic, and guided. For more information, see the descriptions of each keyword below.

Default

static-balanced Iterations are divided into even-sized chunks and the chunks are assigned to the threads in the team in a round-robin fashion in the order of the thread number.

Description

This option lets you specify a scheduling algorithm for loop iterations. It specifies how iterations are to be divided among the threads of the team.

This option is only useful when specified with option `[Q]parallel`.

This option affects performance tuning and can provide better performance during auto-parallelization. It does nothing if it is used with option `[q or Q]openmp`.

Option	Description
`[Q]par-schedule-auto`	Lets the compiler or run-time system determine the scheduling algorithm. Any possible mapping may occur for iterations to threads in the team.

Option	Description
`[Q]par-schedule-static`	Divides iterations into contiguous pieces (chunks) of size *n*. The chunks are assigned to threads in the team in a round-robin fashion in the order of the thread number. Note that the last chunk to be assigned may have a smaller number of iterations. If no *n* is specified, the iteration space is divided into chunks that are approximately equal in size, and each thread is assigned at most one chunk.
`[Q]par-schedule-static-balanced`	Divides iterations into even-sized chunks. The chunks are assigned to the threads in the team in a round-robin fashion in the order of the thread number.
`[Q]par-schedule-static-steal`	Divides iterations into even-sized chunks, but when a thread completes its chunk, it can steal parts of chunks assigned to neighboring threads. Each thread keeps track of L and U, which represent the lower and upper bounds of its chunks respectively. Iterations are executed starting from the lower bound, and simultaneously, L is updated to represent the new lower bound.
`[Q]par-schedule-dynamic`	Can be used to get a set of iterations dynamically. Assigns iterations to threads in chunks as the threads request them. The thread executes the chunk of iterations, then requests another chunk, until no chunks remain to be assigned. As each thread finishes a piece of the iteration space, it dynamically gets the next set of iterations. Each chunk contains *n* iterations, except for the last chunk to be assigned, which may have fewer iterations. If no *n* is specified, the default is 1.
`[Q]par-schedule-guided`	Can be used to specify a minimum number of iterations. Assigns iterations to threads in chunks as the threads request them. The thread executes the chunk of iterations, then requests another chunk, until no chunks remain to be assigned. For a chunk of size 1, the size of each chunk is proportional to the number of unassigned iterations divided by the number of threads, decreasing to 1. For an *n* with value *k* (greater than 1), the size of each chunk is determined in the same way with the restriction that the chunks do not contain fewer than *k* iterations (except for the last chunk to be assigned, which may have fewer than *k* iterations). If no *n* is specified, the default is 1.

Option	Description
`[Q]par-schedule-guided-analytical`	Divides iterations by using exponential distribution or dynamic distribution. The method depends on run-time implementation. Loop bounds are calculated with faster synchronization and chunks are dynamically dispatched at run time by threads in the team.
`[Q]par-schedule-runtime`	Defers the scheduling decision until run time. The scheduling algorithm and chunk size are then taken from the setting of environment variable OMP_SCHEDULE.

NOTE
This option may behave differently on Intel® microprocessors than on non-Intel microprocessors.

IDE Equivalent

None

Alternate Options

None

par-threshold, Qpar-threshold

Sets a threshold for the auto-parallelization of loops.

Syntax

Linux OS:

`-par-threshold[n]`

macOS:

`-par-threshold[n]`

Windows OS:

`/Qpar-threshold[[:]n]`

Arguments

n	Is an integer whose value is the threshold for the auto-parallelization of loops. Possible values are 0 through 100. If *n* is 0, loops get auto-parallelized always, regardless of computation work volume. If *n* is 100, loops get auto-parallelized when performance gains are predicted based on the compiler analysis data. Loops get auto-parallelized only if profitable parallel execution is almost certain.

The intermediate 1 to 99 values represent the percentage probability for profitable speed-up. For example, *n*=50 directs the compiler to parallelize only if there is a 50% probability of the code speeding up if executed in parallel.

Default

`-par-threshold100` or `/Qpar-threshold100`	Loops get auto-parallelized only if profitable parallel execution is almost certain. This is also the default if you do not specify *n*.

Description

This option sets a threshold for the auto-parallelization of loops based on the probability of profitable execution of the loop in parallel. To use this option, you must also specify option `[Q]parallel`.

This option is useful for loops whose computation work volume cannot be determined at compile-time. The threshold is usually relevant when the loop trip count is unknown at compile-time.

The compiler applies a heuristic that tries to balance the overhead of creating multiple threads versus the amount of work available to be shared amongst the threads.

NOTE
This option may behave differently on Intel® microprocessors than on non-Intel microprocessors.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Optimization > Auto-Parallelization Threshold**

OS X

Xcode: **Optimization > Auto-Parallelization Threshold**

Alternate Options

None

parallel, Qparallel

Tells the auto-parallelizer to generate multithreaded code for loops that can be safely executed in parallel.

Syntax

Linux OS:

`-parallel`

macOS:

`-parallel`

Windows OS:

`/Qparallel(or /Qpar)`

Arguments

None

Default

OFF	Multithreaded code is not generated for loops that can be safely executed in parallel.

Description

This option tells the auto-parallelizer to generate multithreaded code for loops that can be safely executed in parallel.

To use this option, you must also specify option `O2` or `O3`.

This option sets option `[q or Q]opt-matmul` if option `O3` is also specified.

NOTE
On macOS systems, when you enable automatic parallelization, you must also set the DYLD_LIBRARY_PATH environment variable within Xcode* or an error will be displayed.

NOTE
Using this option enables parallelization for both Intel® microprocessors and non-Intel microprocessors. The resulting executable may get additional performance gain on Intel microprocessors than on non-Intel microprocessors. The parallelization can also be affected by certain options, such as `/arch` or `/Qx` (Windows*) or `-m` or `-x` (Linux* and macOS).

parallel-source-info, Qparallel-source-info

Enables or disables source location emission when OpenMP or auto-parallelism code is generated.*

Syntax

Linux OS:

`-parallel-source-info[=n]`

`-no-parallel-source-info`

macOS:

`-parallel-source-info[=n]`

`-no-parallel-source-info`

Windows OS:

`/Qparallel-source-info`

`/Qparallel-source-info-[:n]`

Arguments

n	Is the level of source location emission. Possible values are:	
	0	Disables the emission of source location information when OpenMP* code or auto-parallelism code is generated. This is the same as specifying `-no-parallel-source-info` (Linux* and macOS) or `/Qparallel-source-info-` (Windows*).
	1	Tells the compiler to emit routine name and line information. This is the same as specifying `[Q]parallel-source-info` with no *n*.
	2	Tells the compiler to emit path, file, routine name, and line information.

Default

`-parallel-source-info=1` or `/Qparallel-source-info:1`	When OpenMP* code or auto-parallelism code is generated, the routine name and line information is emitted.

Description

This option enables or disables source location emission when OpenMP code or auto-parallelism code is generated. It also lets you set the level of emission.

IDE Equivalent

None

Alternate Options

None

qopenmp, Qopenmp

Enables the parallelizer to generate multi-threaded code based on OpenMP directives.*

Syntax

Linux OS:

`-qopenmp`

`-qno-openmp`

macOS:

`-qopenmp`

`-qno-openmp`

Windows OS:

`/Qopenmp`

`/Qopenmp-`

Arguments

None

Default

`-qno-openmp` or `/Qopenmp-`	No OpenMP* multi-threaded code is generated by the compiler.

Description

This option enables the parallelizer to generate multi-threaded code based on OpenMP* directives. The code can be executed in parallel on both uniprocessor and multiprocessor systems.

This option works with any optimization level. Specifying no optimization (`-O0` on Linux* or `/Od` on Windows*) helps to debug OpenMP applications.

NOTE
On macOS systems, when you enable OpenMP* API, you must also set the DYLD_LIBRARY_PATH environment variable within Xcode* or an error will be displayed.

NOTE
Options that use OpenMP* API are available for both Intel® microprocessors and non-Intel microprocessors, but these options may perform additional optimizations on Intel® microprocessors than they perform on non-Intel microprocessors. The list of major, user-visible OpenMP constructs and features that may perform differently on Intel® microprocessors versus non-Intel microprocessors include: locks (internal and user visible), the SINGLE construct, barriers (explicit and implicit), parallel loop scheduling, reductions, memory allocation, thread affinity, and binding.

Product and Performance Information
Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex. Notice revision #20201201

IDE Equivalent

Visual Studio

Visual Studio: **Language > OpenMP* Support**

Eclipse

Eclipse: **Language > Process OpenMP Directives**

Xcode

Xcode: **Language > Process OpenMP Directives**

Alternate Options

Linux and macOS: `-fopenmp`

Windows: `/openmp`

`qopenmp-stubs, Qopenmp-stubs` compiler option

qopenmp-lib, Qopenmp-lib

Lets you specify an OpenMP run-time library to use for linking.*

Syntax

Linux OS:

`-qopenmp-lib=`*type*

macOS:

`-qopenmp-lib=`*type*

Windows OS:

`/Qopenmp-lib:`*type*

Arguments

type	Specifies the type of library to use; it implies compatibility levels. Currently, the only possible value is:	
	`compat`	Tells the compiler to use the compatibility OpenMP* run-time library (libiomp). This setting provides compatibility with object files created using Microsoft* and GNU* compilers.

Default

`-qopenmp-lib=compat` or `/Qopenmp-lib:compat`	The compiler uses the compatibility OpenMP* run-time library (libiomp).

Description

This option lets you specify an OpenMP* run-time library to use for linking.

The compatibility OpenMP run-time libraries are compatible with object files created using the Microsoft* OpenMP run-time library (vcomp) or the GNU OpenMP run-time library (libgomp).

To use the compatibility OpenMP run-time library, compile and link your application using the compat setting for option `[q or Q]openmp-lib`. To use this option, you must also specify one of the following compiler options:

- Linux* systems: `-qopenmp` or `-qopenmp-stubs`
- Windows* systems: `/Qopenmp` or `/Qopenmp-stubs`

On Windows* systems, the compatibility OpenMP* run-time library lets you combine OpenMP* object files compiled with the Microsoft* C/C++ compiler with OpenMP* object files compiled with the Intel® C, Intel® C++, or Intel® Fortran compilers. The linking phase results in a single, coherent copy of the run-time library.

On Linux* systems, the compatibility Intel OpenMP* run-time library lets you combine OpenMP* object files compiled with the GNU* gcc or gfortran compilers with similar OpenMP* object files compiled with the Intel® C, Intel® C++, or Intel® Fortran Compiler. The linking phase results in a single, coherent copy of the run-time library.

NOTE The compatibility OpenMP run-time library is not compatible with object files created using versions of the Intel compilers earlier than 10.0.

NOTE On Windows* systems, this option is processed by the compiler, which adds directives to the compiled object file that are processed by the linker. On Linux* and macOS systems, this option is processed by the `icc/icpc` command that initiates linking, adding library names explicitly to the link command.

IDE Equivalent

None

Alternate Options

None

`qopenmp, Qopenmp` compiler option

`qopenmp-stubs, Qopenmp-stubs` compiler option

qopenmp-link

Controls whether the compiler links to static or dynamic OpenMP run-time libraries.*

Syntax

Linux OS:

`-qopenmp-link=`*`library`*

macOS:

`-qopenmp-link=`*`library`*

Windows OS:

None

Arguments

library	Specifies the OpenMP library to use. Possible values are:	
	`static`	Tells the compiler to link to static OpenMP run-time libraries. Note that static OpenMP libraries are deprecated.
	`dynamic`	Tells the compiler to link to dynamic OpenMP run-time libraries.

Default

`-qopenmp-link=dynamic`	The compiler links to dynamic OpenMP* run-time libraries. However, if Linux* option `-static` is specified, the compiler links to static OpenMP run-time libraries.

Description

This option controls whether the compiler links to static or dynamic OpenMP* run-time libraries.

To link to the static OpenMP run-time library (RTL) and create a purely static executable, you must specify `-qopenmp-link=static`. However, we strongly recommend you use the default setting, `-qopenmp-link=dynamic`.

NOTE
Compiler options `-static-intel` and `-shared-intel` (Linux* and macOS) have no effect on which OpenMP run-time library is linked.

NOTE
On Linux* systems, `-qopenmp-link=dynamic` cannot be used in conjunction with option `-static`. If you try to specify both options together, an error will be displayed.

NOTE
On Linux systems, the OpenMP runtime library depends on using libpthread and libc (libgcc when compiled with gcc). Libpthread and libc (libgcc) must both be static or both be dynamic. If both libpthread and libc (libgcc) are static, then the static version of the OpenMP runtime should be used. If both libpthread and libc (libgcc) are dynamic, then either the static or dynamic version of the OpenMP runtime may be used.

IDE Equivalent

None

Alternate Options

None

qopenmp-simd, Qopenmp-simd

Enables or disables OpenMP SIMD compilation.*

Syntax

Linux OS:

`-qopenmp-simd`

`-qno-openmp-simd`

macOS:

`-qopenmp-simd`

`-qno-openmp-simd`

Windows OS:

`/Qopenmp-simd`

`/Qopenmp-simd-`

Arguments

None

Default

`-qopenmp-simd` or `/Qopenmp-simd`	OpenMP* SIMD compilation is enabled if option `O2` or higher is in effect. OpenMP* SIMD compilation is always disabled at optimization levels of `O1` or lower. When option `O2` or higher is in effect, OpenMP SIMD compilation can only be disabled by specifying option `-qno-openmp-simd` or `/Qopenmp-simd-`. It is not disabled by specifying option `-qno-openmp` or `/Qopenmp-`.

Description

This option enables or disables OpenMP* SIMD compilation.

You can use this option if you want to enable or disable the SIMD support with no impact on other OpenMP features. In this case, no OpenMP runtime library is needed to link and the compiler does not need to generate OpenMP runtime initialization code.

If you specify this option with the `[q or Q]openmp` option, it can impact other OpenMP features.

IDE Equivalent

None

Alternate Options

None

Example

Consider the following:

```
-qno-openmp -qopenmp-simd    ! Linux or macOS
/Qopenmp- /Qopenmp-simd      ! Windows
```

The above is equivalent to specifying only `[q or Q]openmp-simd`. In this case, only SIMD support is provided, the OpenMP* library is not linked, and only the !$OMP directives related to SIMD are processed.

Consider the following:

```
-qopenmp -qopenmp-simd       ! Linux or macOS
/Qopenmp /Qopenmp-simd       ! Windows
```

In this case, SIMD support is provided, the OpenMP library is linked, and OpenMP runtime initialization code is generated. Note that when you specify `[q or Q]openmp`, it implies `[q or Q]openmp-simd`.

See Also

`qopenmp, Qopenmp` compiler option
`O` compiler option

qopenmp-stubs, Qopenmp-stubs

Enables compilation of OpenMP programs in sequential mode.*

Syntax

Linux OS:

`-qopenmp-stubs`

macOS:

`-qopenmp-stubs`

Windows OS:

`/Qopenmp-stubs`

Arguments

None

Default

OFF	The library of OpenMP* function stubs is not linked.

Description

This option enables compilation of OpenMP* programs in sequential mode. The OpenMP directives are ignored and a stub OpenMP library is linked.

IDE Equivalent

Windows

Visual Studio: **Language > OpenMP Support**

Linux

Eclipse: **Language > Process OpenMP Directives**

OS X

Xcode: **Language > Process OpenMP Directives**

Alternate Options

None

See Also

`qopenmp, Qopenmp` compiler option

qopenmp-threadprivate, Qopenmp-threadprivate

Lets you specify an OpenMP threadprivate implementation.*

Syntax

Linux OS:

`-qopenmp-threadprivate=`*`type`*

macOS:

`None`

Windows OS:

`/Qopenmp-threadprivate:`*`type`*

Arguments

type	Specifies the type of threadprivate implementation. Possible values are:	
	`legacy`	Tells the compiler to use the legacy OpenMP* threadprivate implementation used in the previous releases of the Intel® compiler. This setting does not provide compatibility with the implementation used by other compilers.
	`compat`	Tells the compiler to use the compatibility OpenMP* threadprivate implementation based on applying the __declspec(thread) attribute to each threadprivate variable. The limitations of the attribute on a given

	platform also apply to the threadprivate implementation. This setting provides compatibility with the implementation provided by the Microsoft* and GNU* compilers.

Default

`-qopenmp-threadprivate=legacy` or `/Qopenmp-threadprivate:legacy`	The compiler uses the legacy OpenMP* threadprivate implementation used in the previous releases of the Intel compiler.

Description

This option lets you specify an OpenMP* threadprivate implementation.

The threadprivate implementation of the legacy OpenMP run-time library may not be compatible with object files created using OpenMP run-time libraries supported in other compilers.

To use this option, you must also specify one of the following compiler options:

- Linux* systems: `-qopenmp` or `-qopenmp-stubs`
- Windows* systems: `/Qopenmp` or `/Qopenmp-stubs`

The value specified for this option is independent of the value used for the `[q or Q]openmp-lib` option.

> **NOTE**
> On macOS systems, legacy is the only type of threadprivate supported. Option `-qopenmp-threadprivate` is not recognized by the compiler.

IDE Equivalent

None

Alternate Options

None

Qpar-adjust-stack

Tells the compiler to generate code to adjust the stack size for a fiber-based main thread.

Syntax

Linux OS and macOS:

`None`

Windows OS:

`/Qpar-adjust-stack:`*`n`*

Arguments

n	Is the stack size (in bytes) for the fiber-based main thread. It must be a number equal to or greater than zero.

Default

`/Qpar-adjust-stack:0`	No adjustment is made to the main thread stack size.

Description

This option tells the compiler to generate code to adjust the stack size for a fiber-based main thread. This can reduce the stack size of threads.

For this option to be effective, you must also specify option `/Qparallel`.

IDE Equivalent

None

Alternate Options

None

See Also

`parallel, Qparallel` compiler option

Floating-Point Options

This section contains descriptions for compiler options that pertain to floating-point calculations.

fast-transcendentals, Qfast-transcendentals

Enables the compiler to replace calls to transcendental functions with faster but less precise implementations.

Syntax

Linux OS:

`-fast-transcendentals`

`-no-fast-transcendentals`

macOS:

`-fast-transcendentals`

`-no-fast-transcendentals`

Windows OS:

`/Qfast-transcendentals`

`/Qfast-transcendentals-`

Arguments

None

Default

depends on the setting of `-fp-model` (Linux* and macOS) or `/fp` (Windows*)	If you do not specify option `-[no-]fast-transcendentals` or option /Qfast-transcendentals[-]: • The default is ON if option `-fp-model fast` or `/fp:fast` is specified or is in effect.

- The default is OFF if a value-safe setting is specified for `-fp-model` or `/fp` (such as "precise", "source", etc.).

Description

This option enables the compiler to replace calls to transcendental functions with implementations that may be faster but less precise.

It allows the compiler to perform certain optimizations on transcendental functions, such as replacing individual calls to sine in a loop with a single call to a less precise vectorized sine library routine. These optimizations can cause numerical differences that would not otherwise exist if you are also compiling with a value-safe option such as `-fp-model precise` (Linux* and macOS*) or `/fp:precise` (Windows).

For example, you may get different results if you specify option `O0` versus option `O2`, or you may get different results from calling the same function with the same input at different points in your program. If these kinds of numerical differences are problematic, consider using option `-fimf-use-svml` (Linux* and macOS*) or `/Qimf-use-svml` (Windows) as an alternative. When used with a value-safe option such as `-fp-model precise` or `/fp:precise`, option `-fimf-use-svml` or `/Qimf-use-svml` provides many of the positive performance benefits of `[Q]fast-transcendentals` without negatively affecting numeric consistency. For more details, see the description of option `-fimf-use-svml` and `/Qimf-use-svml`.

This option does not affect explicit Short Vector Math Library (SVML) intrinsics. It only affects scalar calls to the standard math library routines.

You cannot use option `-fast-transcendentals` with option `-fp-model strict` and you cannot use option `/Qfast-transcendentals` with option `/fp:strict`.

This option determines the setting for the maximum allowable relative error for math library function results (max-error) if none of the following options are specified:

- `-fimf-accuracy-bits` (Linux* and macOS) or `/Qimf-accuracy-bits` (Windows*)
- `-fimf-max-error` (Linux and macOS) or `/Qimf-max-error` (Windows)
- `-fimf-precision` (Linux and macOS) or `/Qimf-precision` (Windows)

This option enables extra optimization that only applies to Intel® processors.

`fimf-precision, Qimf-precision` compiler option

fimf-absolute-error, Qimf-absolute-error

Defines the maximum allowable absolute error for math library function results.

Syntax

Linux OS:

`-fimf-absolute-error=`*value*`[:`*funclist*`]`

macOS:

`-fimf-absolute-error=`*value*`[:`*funclist*`]`

Windows OS:

`/Qimf-absolute-error:`*value*`[:`*funclist*`]`

Arguments

value	Is a positive, floating-point number. Errors in math library function results may exceed the maximum relative error (max-error) setting if the absolute-error is less than or equal to *value*. The format for the number is [digits] [.digits] [{ e | E }[sign]digits]
funclist	Is an optional list of one or more math library functions to which the attribute should be applied. If you specify more than one function, they must be separated with commas. Precision-specific variants like sin and sinf are considered different functions, so you would need to use `-fimf-absolute-error=0.00001:sin,sinf` (or `/Qimf-absolute-error:0.00001:sin,sinf`) to specify the maximum allowable absolute error for both the single-precision and double-precision sine functions. You also can specify the symbol /f to denote single-precision divides, symbol / to denote double-precision divides, symbol /l to denote extended-precision divides, and symbol /q to denote quad-precision divides. For example you can specify `-fimf-absolute-error=0.00001:/` or `/Qimf-absolute-error: 0.00001:/`.

Default

Zero ("0")	An absolute-error setting of 0 means that the function is bound by the relative error setting. This is the default behavior.

Description

This option defines the maximum allowable absolute error for math library function results.

This option can improve run-time performance, but it may decrease the accuracy of results.

This option only affects functions that have zero as a possible return value, such as log, sin, asin, etc.

The relative error requirements for a particular function are determined by options that set the maximum relative error (max-error) and precision. The return value from a function must have a relative error less than the max-error value, or an absolute error less than the absolute-error value.

If you need to define the accuracy for a math function of a certain precision, specify the function name of the precision that you need. For example, if you want double precision, you can specify :sin; if you want single precision, you can specify :sinf, as in `-fimf-absolute-error=0.00001:sin` or `/Qimf-absolute-error:0.00001:sin`, or `-fimf-absolute-error=0.00001:sqrtf` or `/Qimf-absolute-error:0.00001:sqrtf`.

If you do not specify any function names, then the setting applies to all functions (and to all precisions). However, as soon as you specify an individual function name, the setting applies only to the function of corresponding precision. So, for example, sinf applies only to the single-precision sine function, sin applies only to the double-precision sine function, sinl applies only to the extended-precision sine function, etc.

NOTE
Many routines in libraries LIBM (Math Library) and SVML (Short Vector Math Library) are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.

fimf-accuracy-bits, Qimf-accuracy-bits

Defines the relative error for math library function results, including division and square root.

Syntax

Linux OS:

`-fimf-accuracy-bits=`*`bits`*`[:`*`funclist`*`]`

macOS:

`-fimf-accuracy-bits=`*`bits`*`[:`*`funclist`*`]`

Windows OS:

`/Qimf-accuracy-bits:`*`bits`*`[:`*`funclist`*`]`

Arguments

bits	Is a positive, floating-point number indicating the number of correct bits the compiler should use. The format for the number is [digits] [.digits] [{ e | E }[sign]digits].
funclist	Is an optional list of one or more math library functions to which the attribute should be applied. If you specify more than one function, they must be separated with commas. Precision-specific variants like sin and sinf are considered different functions, so you would need to use `-fimf-accuracy-bits=23:sin,sinf` (or `/Qimf-accuracy-bits:23:sin,sinf`) to specify the relative error for both the single-precision and double-precision sine functions. You also can specify the symbol /f to denote single-precision divides, symbol / to denote double-precision divides, symbol /l to denote extended-precision divides, and symbol /q to denote quad-precision divides. For example you can specify `-fimf-accuracy-bits=10.0:/f` or `/Qimf-accuracy-bits:10.0:/f`.

Default

-fimf-precision=medium or /Qimf-precision:medium	The compiler uses medium precision when calling math library functions. Note that other options can affect precision; see below for details.

Description

This option defines the relative error, measured by the number of correct bits, for math library function results.

The following formula is used to convert bits into ulps: ulps = $2^{p-1-bits}$, where p is the number of the target format mantissa bits (24, 53, and 64 for single, double, and long double, respectively).

This option can affect run-time performance and the accuracy of results.

If you need to define the accuracy for a math function of a certain precision, specify the function name of the precision that you need. For example, if you want double precision, you can specify :sin; if you want single precision, you can specify :sinf, as in the following:

- `-fimf-accuracy-bits=23:sinf,cosf,logf` or `/Qimf-accuracy-bits:23:sinf,cosf,logf`
- `-fimf-accuracy-bits=52:sqrt,/,trunc` or `/Qimf-accuracy-bits:52:sqrt,/,trunc`
- `-fimf-accuracy-bits=10:powf` or `/Qimf-accuracy-bits:10:powf`

If you do not specify any function names, then the setting applies to all functions (and to all precisions). However, as soon as you specify an individual function name, the setting applies only to the function of corresponding precision. So, for example, sinf applies only to the single-precision sine function, sin applies only to the double-precision sine function, sinl applies only to the extended-precision sine function, etc.

There are three options you can use to express the maximum relative error. They are as follows:

- `-fimf-precision` (Linux* and macOS) or `/Qimf-precision` (Windows*)
- `-fimf-max-error` (Linux* and macOS) or `/Qimf-max-error` (Windows*)
- `-fimf-accuracy-bits` (Linux and macOS) or `/Qimf-accuracy-bits` (Windows)

If more than one of these options are specified, the default value for the maximum relative error is determined by the last one specified on the command line.

If none of the above options are specified, the default values for the maximum relative error are determined by the setting of the following options:

- [Q]fast-transcendentals
- [Q]prec-div
- [Q]prec-sqrt
- -fp-model (Linux and macOS) or /fp (Windows)

NOTE
Many routines in libraries LIBM (Math Library) and SVML (Short Vector Math Library) are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.

fimf-arch-consistency, Qimf-arch-consistency

Ensures that the math library functions produce consistent results across different microarchitectural implementations of the same architecture.

Syntax

Linux OS:

-fimf-arch-consistency=*value*[:*funclist*]

macOS:

-fimf-arch-consistency=*value*[:*funclist*]

Windows OS:

/Qimf-arch-consistency:*value*[:*funclist*]

Arguments

value	Is one of the logical values "true" or "false".

funclist	Is an optional list of one or more math library functions to which the attribute should be applied. If you specify more than one function, they must be separated with commas. Precision-specific variants like sin and sinf are considered different functions, so you would need to use `-fimf-arch-consistency=true:sin,sinf` (or `/Qimf-arch-consistency:true:sin,sinf`) to specify consistent results for both the single-precision and double-precision sine functions. You also can specify the symbol /f to denote single-precision divides, symbol / to denote double-precision divides, symbol /l to denote extended-precision divides, and symbol /q to denote quad-precision divides. For example you can specify `-fimf-arch-consistency=true:/` or `/Qimf-arch-consistency:true:/`.

Default

false	Implementations of some math library functions may produce slightly different results on implementations of the same architecture.

Description

This option ensures that the math library functions produce consistent results across different microarchitectural implementations of the same architecture (for example, across different microarchitectural implementations of IA-32 architecture). Consistency is only guaranteed for a single binary. Consistency is not guaranteed across different architectures. For example, consistency is not guaranteed across IA-32 architecture and Intel® 64 architecture.

If you need to define the accuracy for a math function of a certain precision, specify the function name of the precision that you need. For example, if you want double precision, you can specify :sin; if you want single precision, you can specify :sinf, as in `-fimf-arch-consistency=true:sin` or `/Qimf-arch-consistency:true:sin`, or `-fimf-arch-consistency=false:sqrtf` or `/Qimf-arch-consistency:false:sqrtf`.

If you do not specify any function names, then the setting applies to all functions (and to all precisions). However, as soon as you specify an individual function name, the setting applies only to the function of corresponding precision. So, for example, sinf applies only to the single-precision sine function, sin applies only to the double-precision sine function, sinl applies only to the extended-precision sine function, etc.

The `-fimf-arch-consistency` (Linux* and macOS) and `/Qimf-arch-consistency` (Windows*) option may decrease run-time performance, but the option will provide bit-wise consistent results on all Intel® processors and compatible, non-Intel processors, regardless of micro-architecture. This option may not provide bit-wise consistent results between different architectures.

NOTE
Many routines in libraries LIBM (Math Library) and SVML (Short Vector Math Library) are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.

fimf-domain-exclusion, Qimf-domain-exclusion

Indicates the input arguments domain on which math functions must provide correct results.

Syntax

Linux OS:

`-fimf-domain-exclusion=`*`classlist`*`[:`*`funclist`*`]`

macOS:

`-fimf-domain-exclusion=`*`classlist`*`[:`*`funclist`*`]`

Windows OS:

`/Qimf-domain-exclusion:`*`classlist`*`[:`*`funclist`*`]`

Arguments

classlist Is one of the following:

- One or more of the following floating-point value classes you can exclude from the function domain without affecting the correctness of your program. The supported class names are:

`extremes`	This class is for values which do not lie within the usual domain of arguments for a given function.
`nans`	This means "x=Nan".
`infinities`	This means "x=infinities".
`denormals`	This means "x=denormal".
`zeros`	This means "x=0".

  Each *classlist* element corresponds to a power of two. The exclusion attribute is the logical or of the associated powers of two (that is, a bitmask).

The following shows the current mapping from *classlist* mnemonics to numerical values:

extremes	1
nans	2
infinities	4
denormals	8
zeros	16
none	0
all	31
common	15
other combinations	bitwise OR of the used values

You must specify the integer value that corresponds to the class that you want to exclude.

Note that on excluded values, unexpected results may occur.

- One of the following short-hand tokens:

`none`	This means that none of the supported classes are excluded from the domain. To indicate this token, specify 0, as in `-fimf-domain-exclusion=0` (or `/Qimf-domain-exclusion:0`).
`all`	This means that all of the supported classes are excluded from the domain. To indicate this token, specify 31, as in `-fimf-domain-exclusion=31` (or `/Qimf-domain-exclusion:31`).
`common`	This is the same as specifying extremes,nans,infinities,denormals. To indicate this token, specify 15 (1 + 2+ 4 + 8), as in `-fimf-domain-exclusion=15` (or `/Qimf-domain-exclusion:15`)

funclist

Is an optional list of one or more math library functions to which the attribute should be applied. If you specify more than one function, they must be separated with commas.

Precision-specific variants like sin and sinf are considered different functions, so you would need to use `-fimf-domain-exclusion=4:sin,sinf` (or `/Qimf-domain-exclusion:4:sin,sinf`) to specify infinities for both the single-precision and double-precision sine functions.

You also can specify the symbol /f to denote single-precision divides, symbol / to denote double-precision divides, symbol /l to denote extended-precision divides, and symbol /q to denote quad-precision divides. For example, you can specify:

`-fimf-domain-exclusion=4` or `/Qimf-domain-exclusion:4`

`-fimf-domain-exclusion=5:/,powf` or `/Qimf-domain-exclusion:5:/,powf`

`-fimf-domain-exclusion=23:log,logf,/,sin,cosf`
or `/Qimf-domain-exclusion:23:log,logf,/,sin,cosf`

If you don't specify argument *funclist*, the domain restrictions apply to all math library functions.

Default

Zero ("0")	The compiler uses default heuristics when calling math library functions.

Description

This option indicates the input arguments domain on which math functions must provide correct results. It specifies that your program will function correctly if the functions specified in *funclist* do not produce standard conforming results on the number classes.

This option can affect run-time performance and the accuracy of results. As more classes are excluded, faster code sequences can be used.

If you need to define the accuracy for a math function of a certain precision, specify the function name of the precision that you need. For example, if you want double precision, you can specify :sin; if you want single precision, you can specify :sinf, as in `-fimf-domain-exclusion=denormals:sin` or `/Qimf-domain-exclusion:denormals:sin`, or `-fimf-domain-exclusion=extremes:sqrtf` or `/Qimf-domain-exclusion:extremes:sqrtf`.

If you do not specify any function names, then the setting applies to all functions (and to all precisions). However, as soon as you specify an individual function name, the setting applies only to the function of corresponding precision. So, for example, sinf applies only to the single-precision sine function, sin applies only to the double-precision sine function, sinl applies only to the extended-precision sine function, etc.

NOTE
Many routines in libraries LIBM (Math Library) and SVML (Short Vector Math Library) are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.

Alternate Options

None

Example

Consider the following single-precision sequence for function exp2f:

Operation:	y = exp2f(x)
Accuracy:	1.014 ulp
Instructions:	4 (2 without fix-up)

The following shows the 2-instruction sequence without the fix-up:

```
vcvtfxpntps2dq  zmm1 {k1}, zmm0, 0x50      // zmm1 <-- rndToInt(2^24 * x)
vexp223ps       zmm1 {k1}, zmm1            // zmm1 <-- exp2(x)
```

However, the above 2-instruction sequence will not correctly process NaNs. To process Nans correctly, the following fix-up must be included following the above instruction sequence:

```
vpxord          zmm2, zmm2, zmm2             // zmm2 <-- 0
vfixupnanps     zmm1 {k1}, zmm0, zmm2 {aaaa} // zmm1 <-- QNaN(x) if x is NaN <F>
```

If the `vfixupnanps` instruction is not included, the sequence correctly processes any arguments except NaN values. For example, the following options generate the 2-instruction sequence:

```
-fimf-domain-exclusion=2:exp2f      <- NaN's are excluded (2 corresponds to NaNs)
-fimf-domain-exclusion=6:exp2f      <- NaN's and infinities are excluded (4 corresponds to
infinities; 2 + 4 = 6)
-fimf-domain-exclusion=7:exp2f      <- NaN's, infinities, and extremes are excluded (1
corresponds to extremes; 2 + 4 + 1 = 7)
-fimf-domain-exclusion=15:exp2f     <- NaN's, infinities, extremes, and denormals are excluded
(8 corresponds to denormals;  2 + 4 + 1 + 8=15)
```

If the `vfixupnanps` instruction is included, the sequence correctly processes any arguments including NaN values. For example, the following options generate the 4-instruction sequence:

```
-fimf-domain-exclusion=1:exp2f      <- only extremes are excluded (1 corresponds to extremes)
-fimf-domain-exclusion=4:exp2f      <- only infinities are excluded (4 corresponds to infinities)
-fimf-domain-exclusion=8:exp2f      <- only denormals are excluded (8 corresponds to denormals)
-fimf-domain-exclusion=13:exp2f     <- only extremes, infinities and denormals are excluded (1 +
4 + 8 = 13)
```

fimf-force-dynamic-target, Qimf-force-dynamic-target

Instructs the compiler to use run-time dispatch in calls to math functions.

Syntax

Linux OS:

`-fimf-force-dynamic-target[=`*funclist*`]`

macOS:

`-fimf-force-dynamic-target[=`*funclist*`]`

Windows OS:

`/Qimf-force-dynamic-target[:`*funclist*`]`

Arguments

funclist	Is an optional list of one or more math library functions to which the attribute should be applied. If you specify more than one function, they must be separated with commas. Precision-specific variants like sin and sinf are considered different functions, so you would need to use `-fimf-dynamic-target=sin,sinf` (or `/Qimf-dynamic-target:sin,sinf`) to specify run-time dispatch for both the single-precision and double-precision sine functions. You also can specify the symbol /f to denote single-precision divides, symbol / to denote double-precision divides, symbol /l to denote extended-precision divides, and symbol /q to denote quad-precision divides. For example, you can specify `-fimf-dynamic-target=/` or `/Qimf-dynamic-target:/`.

Default

OFF	Run-time dispatch is not forced in math libraries calls. The compiler can choose to call a CPU-specific version of a math function if one is available.

Description

This option instructs the compiler to use run-time dispatch in calls to math functions. When this option set to ON, it lets you force run-time dispatch in math libraries calls.

By default, when this option is set to OFF, the compiler often optimizes math library calls using the target CPU architecture-specific information available at compile time through the `[Q]x` and `arch` compiler options.

If you want to target multiple CPU families with a single application or you prefer to choose a target CPU at run time, you can force run-time dispatch in math libraries by using this option.

fimf-max-error, Qimf-max-error

Defines the maximum allowable relative error for math library function results, including division and square root.

Syntax

Linux OS:

`-fimf-max-error=`*`ulps`*`[:`*`funclist`*`]`

macOS:

`-fimf-max-error=`*`ulps`*`[:`*`funclist`*`]`

Windows OS:

`/Qimf-max-error:`*`ulps`*`[:`*`funclist`*`]`

Arguments

ulps	Is a positive, floating-point number indicating the maximum allowable relative error the compiler should use. The format for the number is [digits] [.digits] [{ e | E }[sign]digits].
funclist	Is an optional list of one or more math library functions to which the attribute should be applied. If you specify more than one function, they must be separated with commas. Precision-specific variants like sin and sinf are considered different functions, so you would need to use `-fimf-max-error=4.0:sin,sinf` (or `/Qimf-max-error=4.0:sin,sinf`) to specify the maximum allowable relative error for both the single-precision and double-precision sine functions. You also can specify the symbol /f to denote single-precision divides, symbol / to denote double-precision divides, symbol /l to denote extended-precision divides, and symbol /q to denote quad-precision divides. For example you can specify `-fimf-max-error=4.0:/` or `/Qimf-max-error:4.0:/`.

Default

-fimf-precision=medium or /Qimf-precision:medium	The compiler uses medium precision when calling math library functions. Note that other options can affect precision; see below for details.

Description

This option defines the maximum allowable relative error, measured in ulps, for math library function results.

This option can affect run-time performance and the accuracy of results.

If you need to define the accuracy for a math function of a certain precision, specify the function name of the precision that you need. For example, if you want double precision, you can specify :sin; if you want single precision, you can specify :sinf, as in `-fimf-max-error=4.0:sin` or `/Qimf-max-error:4.0:sin`, or `-fimf-max-error=4.0:sqrtf` or `/Qimf-max-error:4.0:sqrtf`.

If you do not specify any function names, then the setting applies to all functions (and to all precisions). However, as soon as you specify an individual function name, the setting applies only to the function of corresponding precision. So, for example, sinf applies only to the single-precision sine function, sin applies only to the double-precision sine function, sinl applies only to the extended-precision sine function, etc.

There are three options you can use to express the maximum relative error. They are as follows:

- `-fimf-precision` (Linux* and macOS) or `/Qimf-precision` (Windows*)
- `-fimf-max-error` (Linux* and macOS) or `/Qimf-max-error` (Windows*)
- `-fimf-accuracy-bits` (Linux and macOS) or `/Qimf-accuracy-bits` (Windows)

If more than one of these options are specified, the default value for the maximum relative error is determined by the last one specified on the command line.

If none of the above options are specified, the default values for the maximum relative error are determined by the setting of the following options:

- `[Q]fast-transcendentals`
- `[Q]prec-div`
- `[Q]prec-sqrt`
- `-fp-model` (Linux and macOS) or `/fp` (Windows)

NOTE
Many routines in libraries LIBM (Math Library) and SVML (Short Vector Math Library) are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.

`fimf-use-svml Qimf-use-svml` compiler option

fimf-precision, Qimf-precision

Lets you specify a level of accuracy (precision) that the compiler should use when determining which math library functions to use.

Syntax

Linux OS:

`-fimf-precision[=`*value*`[:`*funclist*`]]`

macOS:

`-fimf-precision[=`*value*`[:`*funclist*`]]`

Windows OS:

`/Qimf-precision[:`*value*`[:`*funclist*`]]`

Arguments

value	Is one of the following values denoting the desired accuracy:	
	`high`	This is equivalent to max-error = 1.0.
	`medium`	This is equivalent to max-error = 4; this is the default setting if the option is specified and *value* is omitted.
	`low`	This is equivalent to accuracy-bits = 11 for single-precision functions; accuracy-bits = 26 for double-precision functions.
	In the above explanations, max-error means option `-fimf-max-error` (Linux* and macOS) or `/Qimf-max-error` (Windows*); accuracy-bits means option `-fimf-accuracy-bits` (Linux* and macOS) or `/Qimf-accuracy-bits` (Windows*).	
funclist	Is an optional list of one or more math library functions to which the attribute should be applied. If you specify more than one function, they must be separated with commas. Precision-specific variants like sin and sinf are considered different functions, so you would need to use `-fimf-precision=high:sin,sinf` (or `/Qimf-precision:high:sin,sinf`) to specify high precision for both the single-precision and double-precision sine functions. You also can specify the symbol /f to denote single-precision divides, symbol / to denote double-precision divides, symbol /l to denote extended-precision divides, and symbol /q to denote quad-precision divides. For example you can specify `-fimf-precision=low:/` or `/Qimf-precision:low:/` and `-fimf-precision=low:/f` or `/Qimf-precision:low:/f`.	

Default

medium	The compiler uses medium precision when calling math library functions. Note that other options can affect precision; see below for details.

Description

This option lets you specify a level of accuracy (precision) that the compiler should use when determining which math library functions to use.

This option can be used to improve run-time performance if reduced accuracy is sufficient for the application, or it can be used to increase the accuracy of math library functions selected by the compiler.

In general, using a lower precision can improve run-time performance and using a higher precision may reduce run-time performance.

If you need to define the accuracy for a math function of a certain precision, specify the function name of the precision that you need. For example, if you want double precision, you can specify :sin; if you want single precision, you can specify :sinf, as in `-fimf-precision=low:sin` or `/Qimf-precision:low:sin`, or `-fimf-precision=high:sqrtf` or `/Qimf-precision:high:sqrtf`.

If you do not specify any function names, then the setting applies to all functions (and to all precisions). However, as soon as you specify an individual function name, the setting applies only to the function of corresponding precision. So, for example, sinf applies only to the single-precision sine function, sin applies only to the double-precision sine function, sinl applies only to the extended-precision sine function, etc.

There are three options you can use to express the maximum relative error. They are as follows:

- `-fimf-precision` (Linux* and macOS) or `/Qimf-precision` (Windows*)
- `-fimf-max-error` (Linux* and macOS) or `/Qimf-max-error` (Windows*)
- `-fimf-accuracy-bits` (Linux and macOS) or `/Qimf-accuracy-bits` (Windows)

If more than one of these options are specified, the default value for the maximum relative error is determined by the last one specified on the command line.

If none of the above options are specified, the default values for the maximum relative error are determined by the setting of the following options:

- `[Q]fast-transcendentals`
- `[Q]prec-div`
- `[Q]prec-sqrt`
- `-fp-model` (Linux and macOS) or `/fp` (Windows)

NOTE
Many routines in libraries LIBM (Math Library) and SVML (Short Vector Math Library) are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.

fimf-use-svml, Qimf-use-svml

Instructs the compiler to use the Short Vector Math Library (SVML) rather than the Intel® C++ Compiler Classic Math Library (LIBM) to implement math library functions.

Syntax

Linux OS:

`-fimf-use-svml=`*`value`*`[:`*`funclist`*`]`

macOS:

`-fimf-use-svml=`*`value`*`[:`*`funclist`*`]`

Windows OS:

`/Qimf-use-svml:`*`value`*`[:`*`funclist`*`]`

Arguments

funclist	Is an optional list of one or more math library functions to which the attribute should be applied. If you specify more than one function, they must be separated with commas. Precision-specific variants like sin and sinf are considered different functions, so you would need to use `-fimf-use-svmlt=true:sin,sinf` (or `/Qimf-use-svml:true:sin,sinf`) to specify that both the single-precision and double-precision sine functions should use SVML.

Default

false	Math library functions are implemented using the Intel® C++ Compiler Classic Math Library, though other compiler options such as `-fast-transcendentals` or `/Qfast-transcendentals` may give the compiler the flexibility to implement math library functions with either LIBM or SVML.

Description

This option instructs the compiler to implement math library functions using the Short Vector Math Library (SVML). When you specify `-fimf-use-svml=true` or `/Qimf-use-svml:true`, the specific SVML variant chosen is influenced by other compiler options such as `-fimf-precision` (Linux* and macOS) or `/Qimf-precision` (Windows*) and `-fp-model` (Linux and macOS) or `/fp` (Windows). This option has no effect on math library functions that are implemented in LIBM but not in SVML.

In value-safe settings of option `-fp-model` (Linux and macOS) or option `/fp` (Windows) such as precise, this option causes a slight decrease in the accuracy of math library functions, because even the high accuracy SVML functions are slightly less accurate than the corresponding functions in LIBM. Additionally, the SVML functions might not accurately raise floating-point exceptions, do not maintain errno, and are designed to work correctly only in round-to-nearest-even rounding mode.

The benefit of using `-fimf-use-svml=true` or `/Qimf-use-svml:true` with value-safe settings of `-fp-model` (Linux and macOS) or /fp (Windows) is that it can significantly improve performance by enabling the compiler to efficiently vectorize loops containing calls to math library functions.

If you need to use SVML for a specific math function of a certain precision, specify the function name of the precision that you need. For example, if you want double precision, you can specify :sin; if you want single precision, you can specify :sqrtf, as in `-fimf-use-svml=true:sin` or `/Qimf-use-svml:true:sin`, or `-fimf-use-svml =false:sqrtf` or `/Qimf-use-svml:false:sqrtf`.

If you do not specify any function names, then the setting applies to all functions (and to all precisions). However, as soon as you specify an individual function name, the setting applies only to the function of corresponding precision. So, for example, sinf applies only to the single-precision sine function, sin applies only to the double-precision sine function, sinl applies only to the extended-precision sine function, etc.

NOTE
If you specify option `-mia32` (Linux*) or option `/arch:IA32` (Windows*), vector instructions cannot be used. Therefore, you cannot use Linux* option `-mia32` with option `-fimf-use-svml=true`, and you cannot use Windows* option `/arch:IA32` with option `/Qimf-use-svml:true`.

NOTE
Since SVML functions may raise unexpected floating-point exceptions, be cautious about using features that enable trapping on floating-point exceptions. For example, be cautious about specifying option `-fimf-use-svml=true` with option `-fp-trap`, or option `/Qimf-use-svml:true` with option `/Qfp-trap`. For some inputs to some math library functions, such option combinations may cause your program to trap unexpectedly.

None

Default

`-fma` or `/Qfma`	If the instructions exist on the target processor, the compiler generates fused multiply-add (FMA) instructions. However, if you specify `-fp-model strict` (Linux* and macOS) or `/fp:strict` (Windows*), but do not explicitly specify `-fma` or `/Qfma`, the default is `-no-fma` or `/Qfma-`.

Description

This option determines whether the compiler generates fused multiply-add (FMA) instructions if such instructions exist on the target processor. When the `[Q]fma` option is specified, the compiler may generate FMA instructions for combining multiply and add operations. When the negative form of the `[Q]fma` option is specified, the compiler must generate separate multiply and add instructions with intermediate rounding.

This option has no effect unless setting CORE-AVX2 or higher is specified for option [Q]x,`-march` (Linux and macOS), or `/arch` (Windows).

fp-model, fp

Controls the semantics of floating-point calculations.

Syntax

Linux OS:

`-fp-model=`*`keyword`*

macOS:

`-fp-model=`*`keyword`*

Windows OS:

`/fp:`*`keyword`*

Arguments

keyword Specifies the semantics to be used. Possible values are:

`precise`	Disables optimizations that are not value-safe on floating-point data.
`fast[=1|2]`	Enables more aggressive optimizations on floating-point data.
`consistent`	The compiler uses default heuristics to determine results for different optimization levels or between different processors of the same architecture.
`strict`	Enables precise and except, disables contractions, and enables pragma `stdc fenv_access`.
`source`	Rounds intermediate results to source-defined precision.
`double`	Rounds intermediate results to 53-bit (double) precision.
`extended`	Rounds intermediate results to 64-bit (extended) precision.
`[no-]except` (Linux* and macOS) or `except[-]` (Windows*)	Determines whether strict floating-point exception semantics are honored.

Default

`-fp-model=fast=1` or `/fp:fast=1`	The compiler uses more aggressive optimizations on floating-point calculations.

Description

This option controls the semantics of floating-point calculations.

The *keywords* can be considered in groups:

- Group A: `precise`, `fast`, `strict`
- Group B: `source`, `double`, `extended`
- Group C: `except` (or negative forms `-no-except` or `/except-`)
- Group D: `consistent`

You can specify more than one *keyword*. However, the following rules apply:

- You cannot specify `fast` and `except` together in the same compilation. You can specify any other combination of group A, group B, and group C.
  Since `fast` is the default, you must not specify `except` without a group A or group B *keyword*.
- You should specify only one *keyword* from group A and only one *keyword* from group B. If you try to specify more than one *keyword* from either group A or group B, the last (rightmost) one takes effect.
- If you specify `except` more than once, the last (rightmost) one takes effect.
- If you specify `consistent` and any other keyword from another group, the last (rightmost) one may not fully override the heuristics set by `consistent`.

The floating-point (FP) environment is a collection of registers that control the behavior of FP machine instructions and indicate the current FP status. The floating-point environment may include rounding-mode controls, exception masks, flush-to-zero controls, exception status flags, and other floating-point related features.

<table>
<tr><th>Option</th><th>Description</th></tr>
<tr><td><code>-fp-model=precise</code> or <code>/fp:precise</code></td><td>
Tells the compiler to strictly adhere to value-safe optimizations when implementing floating-point calculations. It disables optimizations that can change the result of floating-point calculations, which is required for strict ANSI conformance.
These semantics ensure the reproducibility of floating-point computations for serial code, including code vectorized or auto-parallelized by the compiler, but they may slow performance. They do not ensure value safety or run-to-run reproducibility of other parallel code.
Run-to-run reproducibility for floating-point reductions in OpenMP* code may be obtained for a fixed number of threads through the KMP_DETERMINISTIC_REDUCTION environment variable. For more information about this environment variable, see topic "Supported Environment Variables".
The compiler assumes the default floating-point environment; you are not allowed to modify it.
Intermediate results are computed with the precision shown in the following table, unless it is overridden by a keyword from Group B:
<table>
<tr><td></td><td>Windows</td><td>Linux</td><td>macOS</td></tr>
<tr><td>IA-32 architecture</td><td>Double</td><td>Extended</td><td>Not applicable</td></tr>
<tr><td>Intel® 64 architecture</td><td>Source</td><td>Source</td><td>Source</td></tr>
</table>
Floating-point exception semantics are disabled by default. To enable these semantics, you must also specify <code>-fp-model=except</code> or <code>/fp:except</code>.
</td></tr>
</table>

Option	Description
`-fp-model=fast[=1|2]` or `/fp:fast[=1|2]`	Tells the compiler to use more aggressive optimizations when implementing floating-point calculations. These optimizations increase speed, but may affect the accuracy or reproducibility of floating-point computations. Specifying fast is the same as specifying `fast=1`. `fast=2` may produce faster and less accurate results. Floating-point exception semantics are disabled by default and they cannot be enabled because you cannot specify fast and except together in the same compilation. To enable exception semantics, you must explicitly specify another keyword (see other keyword descriptions for details). To enable exception semantics, you must explicitly specify another keyword (see other keyword descriptions for details).
`-fp-model=consistent` or `/fp:consistent`	The compiler uses default heuristics to generate code that will determine results for different optimization levels or between different processors of the same architecture . For more information, see the article titled: Consistency of Floating-Point Results using the Intel® Compiler.
`-fp-model=source` or `/fp:source`	This option causes intermediate results to be rounded to the precision defined in the source code. It also implies keyword `precise` unless it is overridden by a keyword from Group A. Intermediate expressions use the precision of the operand with higher precision, if any. `long double` — 64-bit precision — 80-bit data type — 15-bit exponent `double` — 53-bit precision — 64-bit data type — 11-bit exponent; on Windows systems using IA-32 architecture, the exponent may be 15-bit if an x87 register

Option	Description
	is used to hold the value.
	`float` 24-bit precision; 32-bit data type; 8-bit exponent
	The compiler assumes the default floating-point environment; you are not allowed to modify it.
`-fp-model=double` or `/fp:double`	This option causes intermediate results to be rounded as follows: 53-bit (double) precision 64-bit data type 11-bit exponent; on Windows systems using IA-32 architecture, the exponent may be 15-bit if an x87 register is used to hold the value. This option also implies keyword `precise` unless it is overridden by a keyword from Group A. The compiler assumes the default floating-point environment; you are not allowed to modify it.
`-fp-model=extended` or `/fp:extended`	This option causes intermediate results to be rounded as follows: 64-bit (extended) precision 80-bit data type 15-bit exponent This option also implies keyword `precise` unless it is overridden by a keyword from Group A. The compiler assumes the default floating-point environment; you are not allowed to modify it.
`-fp-model=except` or `/fp:except`	Tells the compiler to follow strict floating-point exception semantics.

The `-fp-model` and `/fp` options determine the setting for the maximum allowable relative error for math library function results (max-error) if none of the following options are specified (the following options are only available for ifort):

- `-fimf-accuracy-bits` (Linux* and macOS) or `/Qimf-accuracy-bits` (Windows*)
- `-fimf-max-error` (Linux and macOS) or `/Qimf-max-error` (Windows)
- `-fimf-precision` (Linux and macOS) or `/Qimf-precision` (Windows)
- `[Q]fast-transcendentals`

Option `-fp-model=fast` (and `/fp:fast`) sets option `-fimf-precision=medium` (`/Qimf-precision:medium`) and option `-fp-model=precise` (and `/fp:precise`) implies `-fimf-precision=high` (and `/Qimf-precision:high`). Option `-fp-model=fast=2` (and `/fp:fast2`) sets option `-fimf-precision=medium` (and `/Qimf-precision:medium`) and option `-fimf-domain-exclusion=15` (and `/Qimf-domain-exclusion=15`).

NOTE
In Microsoft* Visual Studio, when you create a Microsoft* Visual C++ project, option `/fp:precise` is set by default. It sets the floating-point model to improve consistency for floating-point operations by disabling certain optimizations that may reduce performance. To set the option back to the general default `/fp:fast`, change the IDE project property for Floating Point Model to Fast.

fp-port, Qfp-port

Rounds floating-point results after floating-point operations.

Syntax

Linux OS:

`-fp-port`

`-no-fp-port`

macOS:

`-fp-port`

`-no-fp-port`

Windows OS:

`/Qfp-port`

`/Qfp-port-`

Arguments

None

Default

`-no-fp-port` or `/Qfp-port-`	The default rounding behavior depends on the compiler's code generation decisions and the precision parameters of the operating system.

Description

This option rounds floating-point results after floating-point operations.

This option is designed to be used with the `-mia32` (Linux*) or `/arch:IA32` (Windows*) option on a 32-bit compiler. Under those conditions, the compiler implements floating-point calculations using the x87 instruction set, which uses an internal precision that may be higher than the precision specified in the program.

By default, the compiler may keep results of floating-point operations in this higher internal precision. Rounding to program precision occurs at unspecified points. This provides better performance, but the floating-point results are less deterministic. The `[Q]fp-port` option rounds floating-point results to user-specified precision at assignments and type conversions. This has some impact on speed.

When compiling for newer architectures, the compiler implements floating-point calculations with different instructions, such as Intel® SSE and SSE2. These Intel® Streaming SIMD Extensions round directly to single precision or double precision at every instruction. In these cases, option `[Q]fp-port` has no effect.

IDE Equivalent

Windows

Floating-point Operations

fp-speculation, Qfp-speculation

Tells the compiler the mode in which to speculate on floating-point operations.

Syntax

Linux OS:

`-fp-speculation=`*mode*

macOS:

`-fp-speculation=`*mode*

Windows OS:

`/Qfp-speculation:`*mode*

Arguments

mode	Is the mode for floating-point operations. Possible values are:	
	`fast`	Tells the compiler to speculate on floating-point operations.
	`safe`	Tells the compiler to disable speculation if there is a possibility that the speculation may cause a floating-point exception.
	`strict`	Tells the compiler to disable speculation on floating-point operations.
	`off`	This is the same as specifying strict. This feature is only available for ifort.

Default

`-fp-speculation=fast` or `/Qfp-speculation:fast`	The compiler speculates on floating-point operations. This is also the behavior when optimizations are enabled. However, if you specify no optimizations (`-O0` on Linux*; `/Od` on Windows*), the default is `-fp-speculation=safe` (Linux*) or `/Qfp-speculation:safe` (Windows*).

Description

This option tells the compiler the mode in which to speculate on floating-point operations.

Disabling speculation may prevent the vectorization of some loops containing conditionals.

IDE Equivalent

Visual Studio: **Optimization > Floating-Point Speculation**

Eclipse: **Floating Point > Floating-Point Speculation**

Xcode: **Floating Point > Floating-Point Speculation**

Alternate Options

None

fp-stack-check, Qfp-stack-check

Tells the compiler to generate extra code after every function call to ensure that the floating-point stack is in the expected state.

Syntax

Linux OS:

`-fp-stack-check`

macOS:

`-fp-stack-check`

Windows OS:

`/Qfp-stack-check`

Arguments

None

Default

OFF	There is no checking to ensure that the floating-point (FP) stack is in the expected state.

Description

This option tells the compiler to generate extra code after every function call to ensure that the floating-point (FP) stack is in the expected state.

By default, there is no checking. So when the FP stack overflows, a NaN value is put into FP calculations and the program's results differ. Unfortunately, the overflow point can be far away from the point of the actual bug. This option places code that causes an access violation exception immediately after an incorrect call occurs, thus making it easier to locate these issues.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Floating Point > Check Floating-point Stack**

OS X

Xcode: **Floating Point > Check Floating-point Stack**

Alternate Options

None

fp-trap, Qfp-trap

Sets the floating-point trapping mode for the main routine.

Syntax

Linux OS:

`-fp-trap=`*mode*`[,`*mode*`,...]`

macOS:

`-fp-trap=`*mode*`[,`*mode*`,...]`

Windows OS:

`/Qfp-trap:`*mode*`[,`*mode*`,...]`

Arguments

mode — Is the floating-point trapping mode. If you specify more than one mode value, the list is processed sequentially from left to right. Possible values are:

`[no]divzero`	Enables or disables the IEEE trap for division by zero.
`[no]inexact`	Enables or disables the IEEE trap for inexact result.
`[no]invalid`	Enables or disables the IEEE trap for invalid operation.
`[no]overflow`	Enables or disables the IEEE trap for overflow.
`[no]underflow`	Enables or disables the IEEE trap for underflow.
`[no]denormal`	Enables or disables the trap for denormal.
`all`	Enables all of the above traps.
`none`	Disables all of the above traps.
`common`	Sets the most commonly used IEEE traps: division by zero, invalid operation, and overflow.

Default

`-fp-trap=none` or `/Qfp-trap:none`	No traps are enabled when a program starts.

Description

This option sets the floating-point trapping mode for the main routine. It does not set a handler for floating-point exceptions.

The `[no]` form of a `mode` value is only used to modify the meaning of `mode` values `all` and `common`, and can only be used with one of those values. The `[no]` form of the option by itself does not explicitly cause a particular trap to be disabled.

Use `mode` value `inexact` with caution. This results in the trap being enabled whenever a floating-point value cannot be represented exactly, which can cause unexpected results.

If `mode` value `underflow` is specified, the compiler ignores the FTZ (flush-to-zero) bit state of Intel® Streaming SIMD Extensions (Intel® SSE) floating-point units.

When a DAZ (denormals are zero) bit is set in an Intel® SSE floating-point unit control word, a denormal operand exception is never generated.

To set the floating-point trapping mode for all routines, specify the `[Q]fp-trap-all` option.

NOTE
The negative form of the `[Q]ftz` option can be used to set or reset the FTZ and the DAZ hardware flags.

IDE Equivalent

Windows

Visual Studio: **Code Generation > Unmask Floating Point Exceptions**

Configuration Properties->C/C++ > Unmask Floating Point Exceptions

Linux

Eclipse: **Floating Point > Initial Exception Mask**

OS X

Xcode: **Floating Point > Set Initial Exception Mask**

Alternate Options

None

See Also

`ftz, Qftz` compiler option
`fp-trap-all, Qfp-trap-all` compiler option

fp-trap-all, Qfp-trap-all

Sets the floating-point trapping mode for all routines.

Syntax

Linux OS:

`-fp-trap-all=`*mode*`[,`*mode*`,...]`

macOS:

`-fp-trap-all=`*mode*`[,`*mode*`,...]`

Windows OS:

`/Qfp-trap-all:`*mode*`[,`*mode*`,...]`

Arguments

mode	Is the floating-point trapping mode. If you specify more than one mode value, the list is processed sequentially from left to right. Possible values are:

`[no]divzero`	Enables or disables the IEEE trap for division by zero.
`[no]inexact`	Enables or disables the IEEE trap for inexact result.
`[no]invalid`	Enables or disables the IEEE trap for invalid operation.
`[no]overflow`	Enables or disables the IEEE trap for overflow.
`[no]underflow`	Enables or disables the IEEE trap for underflow.
`[no]denormal`	Enables or disables the trap for denormal.
`all`	Enables all of the above traps.
`none`	Disables all of the above traps.
`common`	Sets the most commonly used IEEE traps: division by zero, invalid operation, and overflow.

Default

`-fp-trap-all=none` No traps are enabled for all routines.
or
`/Qfp-trap-all:none`

Description

This option sets the floating-point trapping mode for the main routine. It does not set a handler for floating-point exceptions.

The `[no]` form of a `mode` value is only used to modify the meaning of `mode` values `all` and `common`, and can only be used with one of those values. The `[no]` form of the option by itself does not explicitly cause a particular trap to be disabled.

Use `mode` value `inexact` with caution. This results in the trap being enabled whenever a floating-point value cannot be represented exactly, which can cause unexpected results.

If `mode` value `underflow` is specified, the compiler ignores the FTZ (flush-to-zero) bit state of Intel® Streaming SIMD Extensions (Intel® SSE) floating-point units.

When a DAZ (denormals are zero) bit is set in an Intel® SSE floating-point unit control word, a denormal operand exception is never generated.

To set the floating-point trapping mode for the main routine only, specify the `[Q]fp-trap` option.

NOTE
The negative form of the `[Q]ftz` option can be used to set or reset the FTZ and the DAZ hardware flags.

IDE Equivalent

None

Alternate Options

None

See Also

`ftz, Qftz` compiler option
`fp-trap, Qfp-trap` compiler option

ftz, Qftz

Flushes denormal results to zero.

Syntax

Linux OS:

`-ftz`

`-no-ftz`

macOS:

`-ftz`

`-no-ftz`

Windows OS:

`/Qftz`

`/Qftz-`

Arguments

None

Default

`-ftz` or `/Qftz`	Denormal results are flushed to zero. Every optimization option `O` level, except `O0`, sets `[Q]ftz`.

Description

This option flushes denormal results to zero when the application is in the gradual underflow mode. It may improve performance if the denormal values are not critical to your application's behavior.

The `[Q]ftz` option has no effect during compile-time optimization.

The `[Q]ftz` option sets or resets the FTZ and the DAZ hardware flags. If FTZ is ON, denormal results from floating-point calculations will be set to the value zero. If FTZ is OFF, denormal results remain as is. If DAZ is ON, denormal values used as input to floating-point instructions will be treated as zero. If DAZ is OFF, denormal instruction inputs remain as is. Systems using Intel® 64 architecture have both FTZ and DAZ. FTZ and DAZ are not supported on all IA-32 architectures.

When the `[Q]ftz` option is used in combination with an SSE-enabling option on systems using IA-32 architecture (for example, the `[Q]xSSE2` option), the compiler will insert code in the main routine to set FTZ and DAZ. When `[Q]ftz` is used without such an option, the compiler will insert code to conditionally set FTZ/DAZ based on a run-time processor check.

If you specify option `-no-ftz` (Linux and macOS) or option `/Qftz-` (Windows), it prevents the compiler from inserting any code that might set FTZ or DAZ.

Option `[Q]ftz` only has an effect when the main program is being compiled. It sets the FTZ/DAZ mode for the process. The initial thread and any threads subsequently created by that process will operate in FTZ/DAZ mode.

If this option produces undesirable results of the numerical behavior of your program, you can turn the FTZ/DAZ mode off by specifying `-no-ftz` or `/Qftz-` in the command line while still benefiting from the `O3` optimizations.

NOTE
Option `[Q]ftz` is a performance option. Setting this option does not guarantee that all denormals in a program are flushed to zero. The option only causes denormals generated at run time to be flushed to zero.

IDE Equivalent

Windows

Visual Studio: **Optimization > Flush Denormal Results to Zero**

Linux

Eclipse: **Floating-Point > Flush Denormal Results to Zero**

OS X

Xcode: **Floating-Point > Flush Denormal Results to Zero**

`x, Qx` compiler option
Setting the FTZ and DAZ Flags

Ge

Enables stack-checking for all functions. This is a deprecated option that may be removed in a future release.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Ge`

Arguments

None

Default

OFF	Stack-checking for all functions is disabled.

Description

This option enables stack-checking for all functions.

This is a deprecated option that may be removed in a future release. The replacement option is `/Gs0`.

IDE Equivalent

None

Alternate Options

Linux and macOS: None

Windows: `/Gs0`

mp1, Qprec

Improves floating-point precision and consistency.

Syntax

Linux OS:

`-mp1`

macOS:

`-mp1`

Windows OS:

`/Qprec`

Arguments

None

Default

OFF	The compiler provides good accuracy and run-time performance at the expense of less consistent floating-point results.

Description

This option improves floating-point consistency. It ensures the out-of-range check of operands of transcendental functions and improves the accuracy of floating-point compares.

This option prevents the compiler from performing optimizations that change NaN comparison semantics and causes all values to be truncated to declared precision before they are used in comparisons. It also causes the compiler to use library routines that give better precision results compared to the X87 transcendental instructions.

This option disables fewer optimizations and has less impact on performance than option `-fp-model precise` (Linux* and macOS) or option `/fp:precise` (Windows*).

IDE Equivalent

Visual Studio

Visual Studio: None

Eclipse

Eclipse: None

Xcode

Xcode: **FloatingPoint > Improve Floating-Point Consistency**

Alternate Options

None

See Also

pc, Qpc

Enables control of floating-point significand precision.

Syntax

Linux OS:

`-pc`*n*

macOS:

`-pc`*n*

Windows OS:

`/Qpc`*n*

Arguments

n	Is the floating-point significand precision. Possible values are:	
	`32`	Rounds the significand to 24 bits (single precision).
	`64`	Rounds the significand to 53 bits (double precision).
	`80`	Rounds the significand to 64 bits (extended precision).

Default

`-pc80` or `/Qpc64`	On Linux* and macOS systems, the floating-point significand is rounded to 64 bits. On Windows* systems, the floating-point significand is rounded to 53 bits.

Description

This option enables control of floating-point significand precision.

Some floating-point algorithms are sensitive to the accuracy of the significand, or fractional part of the floating-point value. For example, iterative operations like division and finding the square root can run faster if you lower the precision with this option.

Note that a change of the default precision control or rounding mode, for example, by using the `[Q]pc32` option or by user intervention, may affect the results returned by some of the mathematical functions.

IDE Equivalent

None

Alternate Options

None

prec-div, Qprec-div

Improves precision of floating-point divides.

Syntax

Linux OS:

`-prec-div`

`-no-prec-div`

macOS:

`-prec-div`

`-no-prec-div`

Windows OS:

`/Qprec-div`

`/Qprec-div-`

Arguments

None

Default

OFF	Default heuristics are used. The default is not as accurate as full IEEE division, but it is slightly more accurate than would be obtained when `/Qprec-div-` or `-no-prec-div` is specified. If you need full IEEE precision for division, you should specify `[Q]prec-div`.

Description

This option improves precision of floating-point divides. It has a slight impact on speed.

At default optimization levels, the compiler may change floating-point division computations into multiplication by the reciprocal of the denominator. For example, A/B is computed as A * (1/B) to improve the speed of the computation.

However, sometimes the value produced by this transformation is not as accurate as full IEEE division. When it is important to have fully precise IEEE division, use this option to disable the floating-point division-to-multiplication optimization. The result is more accurate, with some loss of performance.

If you specify `-no-prec-div` (Linux* and macOS) or `/Qprec-div-` (Windows*), it enables optimizations that give slightly less precise results than full IEEE division.

Option `[Q]prec-div` is implied by option `-fp-model precise` (Linux* and macOS) and option `/fp:precise` (Windows*).

IDE Equivalent

None

Alternate Options

None

See Also

`fp-model, fp` compiler option

prec-sqrt, Qprec-sqrt

Improves precision of square root implementations.

Syntax

Linux OS:

`-prec-sqrt`

`-no-prec-sqrt`

macOS:

`-prec-sqrt`

`-no-prec-sqrt`

Windows OS:

`/Qprec-sqrt`

`/Qprec-sqrt-`

Arguments

None

Default

`-no-prec-sqrt` or `/Qprec-sqrt-`	The compiler uses a faster but less precise implementation of square root. However, the default is `-prec-sqrt` or `/Qprec-sqrt` if any of the following options are specified: `/Od`, `/fp:precise`, or `/Qprec` on Windows* systems; `-O0` or `-mp1` on Linux* and macOS systems.

Description

This option improves precision of square root implementations. It has a slight impact on speed.

This option inhibits any optimizations that can adversely affect the precision of a square root computation. The result is fully precise square root implementations, with some loss of performance.

IDE Equivalent

None

Alternate Options

None

qsimd-honor-fp-model, Qsimd-honor-fp-model

Tells the compiler to obey the selected floating-point model when vectorizing SIMD loops.

Syntax

Linux OS:

`-qsimd-honor-fp-model`

`-qno-simd-honor-fp-model`

macOS:

`-qsimd-honor-fp-model`

`-qno-simd-honor-fp-model`

Windows OS:

`/Qsimd-honor-fp-model`

`/Qsimd-honor-fp-model-`

Arguments

None

Default

`-qno-simd-honor-fp-model` or `/Qsimd-honor-fp-model-`	The compiler performs vectorization of SIMD loops even if it breaks the floating-point model setting.

Description

The OpenMP* SIMD specification and the setting of compiler option `-fp-model` (Linux* and macOS) or `/fp` (Windows*) can contradict in requirements. When contradiction occurs, the default behavior of the compiler is to follow the OpenMP* specification and therefore vectorize the loop.

This option lets you override this default behavior - it causes the compiler to follow the `-fp-model` (or `/fp`) specification. This means that the compiler will serialize the loop.

> **NOTE**
> This option does not affect automatic vectorization of loops. By default, the compiler uses `-fp-model` (Linux* and macOS) or `/fp` (Windows*) settings for this.

IDE Equivalent

None

Alternate Options

None

See Also

`qsimd-serialize-fp-reduction, Qsimd-serialize-fp-reduction` compiler option

`fp-model, fp` compiler option

simd pragma

qsimd-serialize-fp-reduction, Qsimd-serialize-fp-reduction

Tells the compiler to serialize floating-point reduction when vectorizing SIMD loops.

Syntax

Linux OS:

`-qsimd-serialize-fp-reduction`

`-qno-simd-serialize-fp-reduction`

macOS:

`-qsimd-serialize-fp-reduction`

`-qno-simd-serialize-fp-reduction`

Windows OS:

`/Qsimd-serialize-fp-reduction`

`/Qsimd-serialize-fp-reduction-`

Arguments

None

Default

`-qno-simd-serialize-fp-reduction` or `/Qsimd-serialize-fp-reduction-`	The compiler does not attempt to serialize floating-point reduction in SIMD loops.

Description

The OpenMP* SIMD reduction specification and the setting of compiler option `-fp-model` (Linux* and macOS) or `/fp` (Windows*) can contradict in requirements. When contradiction occurs, the default behavior of the compiler is to follow OpenMP* specification and therefore vectorize the loop, including floating-point reduction.

This option lets you override this default behavior - it causes the compiler to follow the `-fp-model` (or `/fp`) specification. This means that the compiler will serialize the floating-point reduction while vectorizing the rest of the loop.

NOTE
When `[q or Q]simd-honor-fp-model` is specified and OpenMP* SIMD reduction specification is the only thing causing serialization of the entire loop, addition of option `[q or Q]simd-serialize-fp-reduction` will result in vectorization of the entire loop except for reduction calculation, which will be serialized.

NOTE
This option does not affect automatic vectorization of loops. By default, the compiler uses `-fp-model` (Linux* and macOS) or `/fp` (Windows*) settings for this.

IDE Equivalent

None

Alternate Options

None

simd pragma

rcd, Qrcd

Enables fast float-to-integer conversions. This is a deprecated option that may be removed in a future release.

Syntax

Linux OS:

`-rcd`

macOS:

`-rcd`

Windows OS:

`/Qrcd`

Arguments

None

Default

OFF	Floating-point values are truncated when a conversion to an integer is involved.

Description

This option enables fast float-to-integer conversions. It can improve the performance of code that requires floating-point-to-integer conversions.

This is a deprecated option that may be removed in a future release. There is no replacement option.

The system default floating-point rounding mode is round-to-nearest. However, the C language requires floating-point values to be truncated when a conversion to an integer is involved. To do this, the compiler must change the rounding mode to truncation before each floating-point-to-integer conversion and change it back afterwards.

This option disables the change to truncation of the rounding mode for all floating-point calculations, including floating point-to-integer conversions. This option can improve performance, but floating-point conversions to integer will not conform to C semantics.

IDE Equivalent

None

Alternate Options

Linux and macOS: None

Windows: `/QIfist` (this is a deprecated option)

Inlining Options

This section contains descriptions for compiler options that pertain to inlining.

fgnu89-inline

Tells the compiler to use C89 semantics for inline functions when in C99 mode.

Syntax

Linux OS:

`-fgnu89-inline`

macOS:

`-fgnu89-inline`

Windows OS:

None

Arguments

None

Default

OFF

Description

This option tells the compiler to use C89 semantics for inline functions when in C99 mode.

IDE Equivalent

None

Alternate Options

None

finline

Tells the compiler to inline functions declared with __inline and perform C++ inlining.

Syntax

Linux OS:

`-finline`

`-fno-inline`

macOS:

`-finline`

`-fno-inline`

Windows OS:

None

Arguments

None

Default

`-fno-inline`	The compiler does not inline functions declared with `__inline`.

Description

This option tells the compiler to inline functions declared with `__inline` and perform C++ inlining.

IDE Equivalent

None

Alternate Options

Linux and macOS: `-inline-level`

Windows: `/Ob`

finline-functions

Enables function inlining for single file compilation.

Syntax

Linux OS:

`-finline-functions`

`-fno-inline-functions`

macOS:

`-finline-functions`

`-fno-inline-functions`

Windows OS:

None

Arguments

None

Default

`-finline-functions`	Interprocedural optimizations occur. However, if you specify `-O0`, the default is OFF.

Description

This option enables function inlining for single file compilation.

It enables the compiler to perform inline function expansion for calls to functions defined within the current source file.

The compiler applies a heuristic to perform the function expansion. To specify the size of the function to be expanded, use the `-finline-limit` option.

IDE Equivalent

None

Alternate Options

Linux and macOS: `-inline-level=2`

Windows: `/Ob2`

See Also

`ip, Qip` compiler option

`finline-limit` compiler option

finline-limit

Lets you specify the maximum size of a function to be inlined.

Syntax

Linux OS:

`-finline-limit=`*n*

macOS:

`-finline-limit=`*n*

Windows OS:

`None`

Arguments

n	Must be an integer greater than or equal to zero. It is the maximum number of lines the function can have to be considered for inlining.

Default

OFF	The compiler uses default heuristics when inlining functions.

Description

This option lets you specify the maximum size of a function to be inlined. The compiler inlines smaller functions, but this option lets you inline large functions. For example, to indicate a large function, you could specify 100 or 1000 for *n*.

Note that parts of functions cannot be inlined, only whole functions.

This option is a modification of the `-finline-functions` option, whose behavior occurs by default.

IDE Equivalent

None

Alternate Options

None

See Also

`finline-functions` compiler option

inline-calloc, Qinline-calloc

Tells the compiler to inline calls to calloc() as calls to malloc() and memset().

Architectures

All

Syntax

Linux OS and macOS:

`-inline-calloc`

`-no-inline-calloc`

Windows OS:

`/Qinline-calloc`

`/Qinline-calloc-`

Arguments

None

Default

`-no-inline-calloc` or `/Qinline-calloc-`	The compiler inlines calls to `calloc()` as calls to `calloc()`.

Description

This option tells the compiler to inline calls to `calloc()` as calls to `malloc()` and `memset()`. This enables additional memset() optimizations. For example, it can enable inlining as a sequence of store operations when the size is a compile time constant.

NOTE
Many routines in the supplied libraries are more highly optimized for Intel® microprocessors than for non-Intel microprocessors

Product and Performance Information
Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex. Notice revision #20201201

IDE Equivalent

None

Alternate Options

None

inline-factor, Qinline-factor

Specifies the percentage multiplier that should be applied to all inlining options that define upper limits.

Syntax

Linux OS:

`-inline-factor=`*n*

`-no-inline-factor`

macOS:

`-inline-factor=`*n*

`-no-inline-factor`

Windows OS:

`/Qinline-factor:`*n*

`/Qinline-factor-`

Arguments

n	Is a positive integer specifying the percentage value. The default value is 100 (a factor of 1).

Default

`-inline-factor=100` or `/Qinline-factor:100`	The compiler uses a percentage multiplier of 100.

Description

This option specifies the percentage multiplier that should be applied to all inlining options that define upper limits:

- `[Q]inline-max-size`
- `[Q]inline-max-total-size`
- `[Q]inline-max-per-routine`
- `[Q]inline-max-per-compile`

The `[Q]inline-factor` option takes the default value for each of the above options and multiplies it by *n* divided by 100. For example, if 200 is specified, all inlining options that define upper limits are multiplied by a factor of 2. This option is useful if you do not want to individually increase each option limit.

If you specify `-no-inline-factor` (Linux* and macOS) or `/Qinline-factor-` (Windows*), the following occurs:

- Every function is considered to be a small or medium function; there are no large functions.
- There is no limit to the size a routine may grow when inline expansion is performed.
- There is no limit to the number of times some routine may be inlined into a particular routine.
- There is no limit to the number of times inlining can be applied to a compilation unit.

To see compiler values for important inlining limits, specify option `[q or Q]opt-report`.

Caution
When you use this option to increase default limits, the compiler may do so much additional inlining that it runs out of memory and terminates with an "out of memory" message.

IDE Equivalent

None

Alternate Options

None

See Also

`inline-max-size, Qinline-max-size` compiler option
`inline-max-total-size, Qinline-max-total-size` compiler option

`qopt-report, Qopt-report` compiler option

inline-forceinline, Qinline-forceinline

Instructs the compiler to force inlining of functions suggested for inlining whenever the compiler is capable doing so.

Syntax

Linux OS:

`-inline-forceinline`

macOS:

`-inline-forceinline`

Windows OS:

`/Qinline-forceinline`

Default

OFF	The compiler uses default heuristics for inline routine expansion.

Description

This option instructs the compiler to force inlining of functions suggested for inlining whenever the compiler is capable doing so.

Without this option, the compiler treats functions declared with the inline keyword as merely being recommended for inlining. When this option is used, it is as if they were declared with the keyword __forceinline keyword.

NOTE
Because C++ member functions whose definitions are included in the class declaration are considered inline functions by default, using this option will also make these member functions "forceinline" functions.

To see compiler values for important inlining limits, specify option `[q or Q]opt-report`.

> **Caution**
> When you use this option to change the meaning of inline to "forceinline", the compiler may do so much additional inlining that it runs out of memory and terminates with an "out of memory" message.

IDE Equivalent

None

Alternate Options

None

See Also

`qopt-report, Qopt-report` compiler option

inline-level, Ob

Specifies the level of inline function expansion.

Syntax

Linux OS:

`-inline-level=n`

macOS:

`-inline-level=n`

Windows OS:

`/Obn`

Arguments

n	Is the inline function expansion level. Possible values are 0, 1, and 2.

Default

`-inline-level=2` or `/Ob2`	This is the default if option `O2` is specified or is in effect by default. On Windows* systems, this is also the default if option `O3` is specified.
`-inline-level=0` or `/Ob0`	This is the default if option `-O0` (Linux* and macOS) or `/Od` (Windows*) is specified.

Description

This option specifies the level of inline function expansion. Inlining procedures can greatly improve the run-time performance of certain programs.

Option	Description
`-inline-level=0` or `/Ob0`	Disables inlining of user-defined functions. Note that statement functions are always inlined.

Option	Description
`-inline-level=1` or `/Ob1`	Enables inlining when an inline keyword or an inline attribute is specified. Also enables inlining according to the C++ language.
`-inline-level=2` or `/Ob2`	Enables inlining of any function at the compiler's discretion.

IDE Equivalent

Windows

Visual Studio: **Optimization > Inline Function Expansion**

Linux

Eclipse: **Optimization > Inline Function Expansion**

OS X

Xcode: **Optimization > Inline Function Expansion**

Alternate Options

None

inline-max-per-compile, Qinline-max-per-compile

Specifies the maximum number of times inlining may be applied to an entire compilation unit.

Syntax

Linux OS:

`-inline-max-per-compile=`*n*

`-no-inline-max-per-compile`

macOS:

`-inline-max-per-compile=`*n*

`-no-inline-max-per-compile`

Windows OS:

`/Qinline-max-per-compile=`*n*

`/Qinline-max-per-compile-`

Arguments

n	Is a positive integer that specifies the number of times inlining may be applied.

Default

`-no-inline-max-per-compile` or `/Qinline-max-per-compile-`	The compiler uses default heuristics for inline routine expansion.

Description

This option the maximum number of times inlining may be applied to an entire compilation unit. It limits the number of times that inlining can be applied.

For compilations using Interprocedural Optimizations (IPO), the entire compilation is a compilation unit. For other compilations, a compilation unit is a file.

If you specify `-no-inline-max-per-compile` (Linux* and macOS) or `/Qinline-max-per-compile-` (Windows*), there is no limit to the number of times inlining may be applied to a compilation unit.

To see compiler values for important inlining limits, specify option `[q or Q]opt-report`.

Caution
When you use this option to increase the default limit, the compiler may do so much additional inlining that it runs out of memory and terminates with an "out of memory" message.

IDE Equivalent

None

Alternate Options

None

See Also

`inline-factor, Qinline-factor` compiler option

`qopt-report, Qopt-report` compiler option

inline-max-per-routine, Qinline-max-per-routine

Specifies the maximum number of times the inliner may inline into a particular routine.

Syntax

Linux OS:

`-inline-max-per-routine=`*n*

`-no-inline-max-per-routine`

macOS:

`-inline-max-per-routine=`*n*

`-no-inline-max-per-routine`

Windows OS:

`/Qinline-max-per-routine=`*n*

`/Qinline-max-per-routine-`

Arguments

n	Is a positive integer that specifies the maximum number of times the inliner may inline into a particular routine.

Default

`-no-inline-max-per-routine` or `/Qinline-max-per-routine-`	The compiler uses default heuristics for inline routine expansion.

Description

This option specifies the maximum number of times the inliner may inline into a particular routine. It limits the number of times that inlining can be applied to any routine.

If you specify `-no-inline-max-per-routine` (Linux* and macOS) or `/Qinline-max-per-routine-` (Windows*), there is no limit to the number of times some routine may be inlined into a particular routine.

To see compiler values for important inlining limits, specify option `[q or Q]opt-report`.

Caution
When you use this option to increase the default limit, the compiler may do so much additional inlining that it runs out of memory and terminates with an "out of memory" message.

IDE Equivalent

None

Alternate Options

None

See Also

`inline-factor, Qinline-factor` compiler option

`qopt-report, Qopt-report` compiler option

inline-max-size, Qinline-max-size

Specifies the lower limit for the size of what the inliner considers to be a large routine.

Syntax

Linux OS:

`-inline-max-size=`*n*

`-no-inline-max-size`

macOS:

`-inline-max-size=`*n*

`-no-inline-max-size`

Windows OS:

`/Qinline-max-size=`*n*

`/Qinline-max-size-`

Arguments

n	Is a positive integer that specifies the minimum size of what the inliner considers to be a large routine.

Default

`-inline-max-size` or `/Qinline-max-size`	The compiler sets the maximum size (*n*) dynamically, based on the platform.

Description

This option specifies the lower limit for the size of what the inliner considers to be a large routine (a function). The inliner classifies routines as small, medium, or large. This option specifies the boundary between what the inliner considers to be medium and large-size routines.

The inliner prefers to inline small routines. It has a preference against inlining large routines. So, any large routine is highly unlikely to be inlined.

If you specify `-no-inline-max-size` (Linux* and macOS) or `/Qinline-max-size-` (Windows*), there are no large routines. Every routine is either a small or medium routine.

To see compiler values for important inlining limits, specify option `[q or Q]opt-report`.

Caution
When you use this option to increase the default limit, the compiler may do so much additional inlining that it runs out of memory and terminates with an "out of memory" message.

IDE Equivalent

None

Alternate Options

None

See Also

`inline-min-size, Qinline-min-size` compiler option

`inline-factor, Qinline-factor` compiler option

`qopt-report, Qopt-report` compiler option

inline-max-total-size, Qinline-max-total-size

Specifies how much larger a routine can normally grow when inline expansion is performed.

Syntax

Linux OS:

`-inline-max-total-size=`*n*

`-no-inline-max-total-size`

macOS:

`-inline-max-total-size=`*n*

`-no-inline-max-total-size`

Windows OS:

`/Qinline-max-total-size=n`

`/Qinline-max-total-size-`

Arguments

n	Is a positive integer that specifies the permitted increase in the routine's size when inline expansion is performed.

Default

`-no-inline-max-total-size` or `/Qinline-max-total-size-`	The compiler uses default heuristics for inline routine expansion.

Description

This option specifies how much larger a routine can normally grow when inline expansion is performed. It limits the potential size of the routine. For example, if 2000 is specified for *n*, the size of any routine will normally not increase by more than 2000.

If you specify `-no-inline-max-total-size` (Linux* and macOS) or `/Qinline-max-total-size-` (Windows*), there is no limit to the size a routine may grow when inline expansion is performed.

To see compiler values for important inlining limits, specify option `[q or Q]opt-report`.

Caution
When you use this option to increase the default limit, the compiler may do so much additional inlining that it runs out of memory and terminates with an "out of memory" message.

IDE Equivalent

None

Alternate Options

None

See Also

`inline-factor, Qinline-factor` compiler option

`qopt-report, Qopt-report` compiler option

inline-min-caller-growth, Qinline-min-caller-growth

Lets you specify a function size n for which functions of size <= n do not contribute to the estimated growth of the caller when inlined.

Syntax

Linux OS:

`-inline-min-caller-growth=n`

macOS:

`-inline-min-caller-growth=`*n*

Windows OS:

`/Qinline-min-caller-growth=`*n*

Arguments

n	Is a non-negative integer. When *n* > 0, functions with a size of *n* are treated as if they are size 0.

Default

`-inline-min-caller-growth=0` or `/Qinline-min-caller-growth=0`	The compiler treats functions as if they have size zero.

Description

This option lets you specify a function size *n* for which functions of size <= *n* do not contribute to the estimated growth of the caller when inlined. It allows you to inline functions that the compiler would otherwise consider too large to inline.

> **NOTE**
> We recommend that you choose a value of *n* <= 10; otherwise, compile time and code size may greatly increase.

IDE Equivalent

None

Alternate Options

None

inline-min-size, Qinline-min-size

Specifies the upper limit for the size of what the inliner considers to be a small routine.

Syntax

Linux OS:

`-inline-min-size=`*n*

`-no-inline-min-size`

macOS:

`-inline-min-size=`*n*

`-no-inline-min-size`

Windows OS:

`/Qinline-min-size=`*n*

`/Qinline-min-size-`

Arguments

n	Is a positive integer that specifies the maximum size of what the inliner considers to be a small routine.

Default

`-no-inline-min-size` or `/Qinline-min-size-`	The compiler uses default heuristics for inline routine expansion.

Description

This option specifies the upper limit for the size of what the inliner considers to be a small routine (a function). The inliner classifies routines as small, medium, or large. This option specifies the boundary between what the inliner considers to be small and medium-size routines.

The inliner has a preference to inline small routines. So, when a routine is smaller than or equal to the specified size, it is very likely to be inlined.

If you specify `-no-inline-min-size` (Linux* and macOS) or `/Qinline-min-size-` (Windows*), there is no limit to the size of small routines. Every routine is a small routine; there are no medium or large routines.

To see compiler values for important inlining limits, specify option `[q or Q]opt-report`.

> **Caution**
> When you use this option to increase the default limit, the compiler may do so much additional inlining that it runs out of memory and terminates with an "out of memory" message.

IDE Equivalent

None

Alternate Options

None

Qinline-dllimport

Determines whether dllimport functions are inlined.

Syntax

Linux OS:

None

macOS:

None

Windows OS:

`/Qinline-dllimport`

`/Qinline-dllimport-`

Arguments

None

Default

`/Qinline-dllimport`	The dllimport functions are inlined.

Description

This option determines whether dllimport functions are inlined. To disable dllimport functions from being inlined, specify `/Qinline-dllimport-`.

IDE Equivalent

None

Alternate Options

None

Output, Debug, and Precompiled Header Options

This section contains descriptions for compiler options that pertain to output, debugging, or precompiled headers (PCH).

c

Prevents linking.

Syntax

Linux OS:

`-c`

macOS:

`-c`

Windows OS:

`/c`

Arguments

None

Default

OFF	Linking is performed.

Description

This option prevents linking. Compilation stops after the object file is generated.

The compiler generates an object file for each C or C++ source file or preprocessed source file. It also takes an assembler file and invokes the assembler to generate an object file.

IDE Equivalent

None

Alternate Options

None

debug (Linux* and macOS)

Enables or disables generation of debugging information.

Syntax

Linux OS:

`-debug [keyword]`

macOS:

`-debug [keyword]`

Windows OS:

`None`

Arguments

keyword Is the type of debugging information to be generated. Possible values are:

`none`	Disables generation of debugging information.
`full` or `all`	Generates complete debugging information.
`minimal`	Generates line number information for debugging.
`[no]emit_column`	Determines whether the compiler generates column number information for debugging.
`[no]expr-source-pos`	Determines whether the compiler generates source position information at the expression level of granularity.
`[no]inline-debug-info`	Determines whether the compiler generates enhanced debug information for inlined code.
`[no]pubnames`	Determines whether the compiler generates a DWARF debug_pubnames section.
`[no]semantic-stepping`	Determines whether the compiler generates enhanced debug information useful for breakpoints and stepping.
`[no]variable-locations`	Determines whether the compiler generates enhanced debug information useful in finding scalar local variables.
`extended`	Generates complete debugging information and also sets keyword values `semantic-stepping` and `variable-locations`.
`[no]parallel` (Linux only)	Determines whether the compiler generates parallel debug code instrumentations useful for thread data sharing and reentrant call detection.

For information on the non-default settings for these keywords, see the Description section.

Default

varies	Normally, the default is `-debug none` and no debugging information is generated. However, on Linux*, the `-debug inline-debug-info` option will be enabled by default if you compile with optimizations (option `-O2` or higher) and debugging is enabled (option `-g`).

Description

This option enables or disables generation of debugging information.

By default, enabling debugging, will disable optimization. To enable both debugging and optimization use the `-debug` option together with one of the optimization level options (`-O3`, `-O2` or `-O3`).

Keywords `semantic-stepping`, `inline-debug-info`, `variable-locations`, and `extended` can be used in combination with each other. If conflicting keywords are used in combination, the last one specified on the command line has precedence.

Option	**Description**
`-debug none`	Disables generation of debugging information.
`-debug full` or `-debug all`	Generates complete debugging information. It is the same as specifying `-debug` with no keyword.
`-debug minimal`	Generates line number information for debugging.
`-debug emit_column`	Generates column number information for debugging.
`-debug expr-source-pos`	Generates source position information at the statement level of granularity.
`-debug inline-debug-info`	Generates enhanced debug information for inlined code. On inlined functions, symbols are (by default) associated with the caller. This option causes symbols for inlined functions to be associated with the source of the called function.
`-debug pubnames`	The compiler generates a DWARF debug_pubnames section. This provides a means to list the names of global objects and functions in a compilation unit.
`-debug semantic-stepping`	Generates enhanced debug information useful for breakpoints and stepping. It tells the debugger to stop only at machine instructions that achieve the final effect of a source statement. For example, in the case of an assignment statement, this might be a store instruction that assigns a value to a program variable; for a function call, it might be the machine instruction that executes the call. Other instructions generated for those source statements are not displayed during stepping. This option has no impact unless optimizations have also been enabled.
`-debug variable-locations`	Generates enhanced debug information useful in finding scalar local variables. It uses a feature of the Dwarf object module known as "location lists".

Option	Description
	This feature allows the run-time locations of local scalar variables to be specified more accurately; that is, whether, at a given position in the code, a variable value is found in memory or a machine register.
`-debug extended`	Sets keyword values `semantic-stepping` and `variable-locations`. It also tells the compiler to include column numbers in the line information. Generates complete debugging information and also sets keyword values `semantic-stepping` and `variable-locations`. This is a more powerful setting than `-debug full` or `-debug all`.
`-debug parallel`	Generates parallel debug code instrumentations needed for the thread data sharing and reentrant call detection. For shared data and reentrancy detection, option `-qopenmp` must be set.

On Linux* systems, debuggers read debug information from executable images. As a result, information is written to object files and then added to the executable by the linker.

On macOS systems, debuggers read debug information from object files. As a result, the executables don't contain any debug information. Therefore, if you want to be able to debug on these systems, you must retain the object files.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Advanced Debugging > Enable Parallel Debug Checks** (`-debug parallel`)

Debug > Enable Expanded Line Number Information (`-debug expr-source-pos`)

OS X

Xcode: None

Alternate Options

For `-debug full`, `-debug all`, or `-debug`	Linux and macOS: `-g` Windows: `/debug:full`, `/debug:all`, or `/debug`
For `-debug variable-locations`	Linux and macOS: `-fvar-tracking` Windows: None
For `-debug semantic-stepping`	Linux and macOS: `-fvar-tracking-assignments` Windows: None

See Also

`debug` (Windows*) compiler option

`qopenmp, Qopenmp` compiler option

debug (Windows*)

Enables or disables generation of debugging information.

Syntax

Linux OS:

None

macOS:

None

Windows OS:

/debug[:*keyword*]

Arguments

keyword	Is the type of debugging information to be generated. Possible values are:	
	none	Disables generation of debugging information.
	full or all	Generates complete debugging information.
	minimal	Generates line number information for debugging.
	partial	Deprecated. Generates global symbol table information needed for linking.
	[no]expr-source-pos	Determines whether the compiler generates source position information at the expression level of granularity.
	[no]inline-debug-info	Determines whether the compiler generates enhanced debug information for inlined code.

For information on the non-default settings for these keywords, see the Description section.

Default

/debug:none	This is the default on the command line and for a release configuration in the IDE.
/debug:all	This is the default for a debug configuration in the IDE.

Description

This option enables or disables generation of debugging information. It is passed to the linker.

By default, enabling debugging, will disable optimization. To enable both debugging and optimization use the /debug option together with one of the optimization level options (/O3, /O2 or /O3).

If conflicting keywords are used in combination, the last one specified on the command line has precedence.

Option	Description
/debug:none	Disables generation of debugging information.

Option	Description
`/debug:full` or `/debug:all`	Generates complete debugging information. It produces symbol table information needed for full symbolic debugging of unoptimized code and global symbol information needed for linking. It is the same as specifying `/debug` with no keyword.
`/debug:minimal`	Generates line number information for debugging.
`/debug:partial`	Generates global symbol table information needed for linking, but not local symbol table information needed for debugging. This option is deprecated and is not available in the IDE.
`/debug:expr-source-pos`	Generates source position information at the statement level of granularity.
`/debug:inline-debug-info`	Generates enhanced debug information for inlined code. On inlined functions, symbols are (by default) associated with the caller. This option causes symbols for inlined functions to be associated with the source of the called function.

IDE Equivalent

Windows

Visual Studio: **Debugging > Enable Expanded Line Number Information** (`/debug:expr-source-pos`)

Linux

Eclipse: None

`debug` (Linux* and macOS) compiler option

Fa

Specifies that an assembly listing file should be generated.

Syntax

Linux OS:

`-Fa[`*`filename`*`|`*`dir`*`]`

macOS:

`-Fa[`*`filename`*`|`*`dir`*`]`

Windows OS:

`/Fa[`*`filename`*`|`*`dir`*`]`

Arguments

filename	Is the name of the assembly listing file.
dir	Is the directory where the file should be placed. It can include *filename*.

Default

OFF	No assembly listing file is produced.

Description

This option specifies that an assembly listing file should be generated (optionally named *filename*).

IDE Equivalent

Windows

Visual Studio: **Output Files > ASM List Location**

Linux

Eclipse: **Output > Generate Assembler Source and Binary Files**

OS X

Xcode: **Output Files > Filename for Generated Assembler Listing, Output > Generate Assembler Listing**

Alternate Options

Linux and macOS: `-S`

Windows: `/S`

FA

Specifies the contents of an assembly listing file.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/FA[`*`specifier`*`]`

Arguments

specifier	Denotes the contents of the assembly listing file. Possible values are `c`, `s`, or `cs`.

Default

OFF	No source or machine code annotations appear in the assembly listing file, if one is produced.

Description

These options specify what information, in addition to the assembly code, should be generated in the assembly listing file.

To use this option, you must also specify option `/Fa`, which causes an assembly listing to be generated.

Option	Description
`/FA`	Produces an assembly listing without source or machine code annotations.
`/FAc`	Produces an assembly listing with machine code annotations.
`/FAs`	Produces an assembly listing with source code annotations. Note that if you use alternate option `-fsource-asm`, you must also specify the `-S` option.
`/FAcs`	Produces an assembly listing with source and machine code annotations.

IDE Equivalent

Windows

Visual Studio: **Output Files > Assembler Output**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

`/FAc`	Linux and macOS: `-fcode-asm` Windows: None
`/FAs`	Linux and macOS: `-fsource-asm` Windows: None

fasm-blocks

Enables the use of blocks and entire functions of assembly code within a C or C++ file.

Syntax

Linux OS:

`-fasm-blocks`

macOS:

`-fasm-blocks`

Windows OS:

`None`

Arguments

None

Default

OFF	The compiler allows a GNU*-style inline assembly format.

Description

This option enables the use of blocks and entire functions of assembly code within a C or C++ file.

It allows a Microsoft* MASM-style inline assembly block not a GNU*-style inline assembly block.

On macOS systems, this option is provided for compatibility with the Apple* GNU compiler.

IDE Equivalent

None

Alternate Options

`-use-msasm`

FC

Displays the full path of source files passed to the compiler in diagnostics.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/FC`

Arguments

None

Default

OFF	The compiler does not display the full path of source files passed to the compiler in diagnostics.

Description

Displays the full path of source files passed to the compiler in diagnostics. This option is supported with Microsoft Visual Studio .NET 2003* or newer.

IDE Equivalent

Windows

Visual Studio: **Advanced > Use Full Paths**

Alternate Options

None

fcode-asm

Produces an assembly listing with machine code annotations.

Syntax

Linux OS:

`-fcode-asm`

macOS:

`-fcode-asm`

Windows OS:

`None`

Arguments

None

Default

OFF	No machine code annotations appear in the assembly listing file, if one is produced.

Description

This option produces an assembly listing file with machine code annotations.

The assembly listing file shows the hex machine instructions at the beginning of each line of assembly code. The file cannot be assembled; the file name is the name of the source file with an extension of `.cod`.

To use this option, you must also specify option `-S`, which causes an assembly listing to be generated.

IDE Equivalent

None

Alternate Options

Linux and macOS: None

Windows: `/FAc`

See Also

S compiler option

Fd

Lets you specify a name for a program database (PDB) file created by the compiler.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Fd[:`*`filename`*`]`

Arguments

filename	Is the name for the PDB file. It can include a path. If you do not specify a file extension, the extension .pdb is used.

Default

OFF	No PDB file is created unless you specify option `/Zi`. If you specify option `/Zi` and `/Fd`, the default filename is vc*x*0.pdb, where *x* represents the version of Visual C++, for example vc100.pdb.

Description

This option lets you specify a name for a program database (PDB) file that is created by the compiler.

A program database (PDB) file holds debugging and project state information that allows incremental linking of a Debug configuration of your program. A PDB file is created when you build with option `/Zi`. Option `/Fd` has no effect unless you specify option `/Zi`.

IDE Equivalent

Windows

Visual Studio: **Output Files > Program Database File Name**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

See Also

Zi, Z7, ZI compiler option
pdbfile compiler option

FD

Generates file dependencies related to the Microsoft C/C++ compiler.*

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/FD`

Arguments

None

Default

OFF	The compiler does not generate Microsoft C/C++-related file dependencies.

Description

This option generates file dependencies related to the Microsoft* C/C++ compiler. It invokes the Microsoft C/C++ compiler and passes the option to it.

IDE Equivalent

None

Alternate Options

None

Fe

Specifies the name for a built program or dynamic-link library.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Fe[[:]`*`filename`*`|`*`dir`*`]`

Arguments

filename	Is the name for the built program or dynamic-link library.
dir	Is the directory where the built program or dynamic-link library should be placed. It can include *file*.

Default

OFF	The name of the file is the name of the first source file on the command line with file extension `.exe`, so `file.f` becomes `file.exe`.

Description

This option specifies the name for a built program (`.EXE`) or a dynamic-link library (`.DLL`).

You can use this option to specify an alternate name for an executable file. This is especially useful when compiling and linking a set of input files. You can use the option to give the resulting file a name other than that of the first input file (source or object) on the command line.

IDE Equivalent

None

Alternate Options

Linux and macOS: `-o`

Windows: None

Example

In the following example, the command produces an executable file named outfile.exe as a result of compiling and linking three files: one object file and two C++ source files.

```
prompt> icl /Feoutfile.exe file1.obj file2.cpp file3.cpp
```

By default, this command produces an executable file named file1.exe.

See Also

- compiler option

feliminate-unused-debug-types, Qeliminate-unused-debug-types

Controls the debug information emitted for types declared in a compilation unit.

Syntax

Linux OS:

`-feliminate-unused-debug-types`

`-fno-eliminate-unused-debug-types`

macOS:

`-feliminate-unused-debug-types`

`-fno-eliminate-unused-debug-types`

Windows OS:

`/Qeliminate-unused-debug-types`

`/Qeliminate-unused-debug-types-`

Arguments

None

Default

`-feliminate-unused-debug-types` or `/Qeliminate-unused-debug-types`	The compiler emits debug information only for types that are actually used by a variable/parameter/etc..

Description

This option controls the debug information emitted for types declared in a compilation unit.

If you specify `-fno-eliminate-unused-debug-types` (Linux and macOS) or `/Qeliminate-unused-debug-types-`, it will cause the compiler to emit debug information for all types present in the sources. This option may cause a large increase in the size of the debug information.

IDE Equivalent

None

Alternate Options

None

femit-class-debug-always

Controls the format and size of debug information generated by the compiler for C++ classes.

Syntax

Linux OS:

`-femit-class-debug-always`

`-fno-emit-class-debug-always`

macOS:

`None`

Windows OS:

`None`

Arguments

None

Default

`-fno-emit-class-debug-always`	Causes the compiler to reduce the amount of debug information generated for C++ classes.

Description

When emission of debug information is enabled, this option will control the format and size of debug information generated by the compiler for C++ classes. It tells the compiler to generate full debug information, or it tells the compiler to reduce the amount of debug information it generates.

When you specify the -femit-class-debug-always option, the compiler emits debug information for a C++ class into each object file where the class is used. This option is useful for tools that are not able to resolve incomplete type descriptions. Note that this option may cause a large increase in the size of the debug information generated.

When you specify the -fno-emit-class-debug-always option, the compiler does not emit full debug information for every instance of C++ class use. In general, this reduces the size of the debugging information generated for C++ applications without impacting debugging ability when used with debuggers that have corresponding support, such as gdb.

IDE Equivalent

None

Alternate Options

None

fmerge-constants

Determines whether the compiler and linker attempt to merge identical constants (string constants and floating-point constants) across compilation units.

Syntax

Linux OS:

`-fmerge-constants`

`-fno-merge-constants`

macOS:

`None`

Windows OS:

`None`

Arguments

None

Default

`-fmerge-constants`	The compiler and linker attempt to merge identical constants across compilation units if the compiler and linker supports it.

Description

This option determines whether the compiler and linker attempt to merge identical constants (string constants and floating-point constants) across compilation units.

If you do not want the compiler and linker to attempt to merge identical constants across compilation units. specify `-fno-merge-constants`.

IDE Equivalent

None

Alternate Options

None

fmerge-debug-strings

Causes the compiler to pool strings used in debugging information.

Syntax

Linux OS:

`-fmerge-debug-strings`

`-fno-merge-debug-strings`

macOS:

None

Windows OS:

None

Arguments

None

Default

`-fmerge-debug-strings`	The compiler will pool strings used in debugging information.

Description

This option causes the compiler to pool strings used in debugging information. The linker will automatically retain this pooling.

This option can reduce the size of debug information, but it may produce slightly slower compile and link times.

This option is only turned on by default if you are using gcc 4.3 or later, where this setting is also the default, since the generated debug tables require binutils version 2.17 or later to work reliably.

If you do not want the compiler to pool strings used in debugging information, specify option `-fno-merge-debug-strings`.

IDE Equivalent

None

Alternate Options

None

Fo

Specifies the name for an object file.

Syntax

Linux OS:

See option `o`.

macOS:

See option `o`.

Windows OS:

`/Fo[[:]`*`filename`*`|`*`dir`*`]`

Arguments

filename	Is the name for the object file.
dir	Is the directory where the object file should be placed. It can include *filename*.

Default

OFF	An object file has the same name as the name of the first source file and a file extension of .obj.

Description

This option specifies the name for an object file.

IDE Equivalent

Windows

Visual Studio: **Output Files > Object File Name**

Alternate Options

None

See Also

- compiler option

Fp

Lets you specify an alternate path or file name for precompiled header files.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Fp{filename|dir}`

Arguments

filename	Is the name for the precompiled header file.
dir	Is the directory where the precompiled header file should be placed. It can include *filename*.

Default

OFF	The compiler does not create or use precompiled headers unless you tell it to do so.

Description

This option lets you specify an alternate path or file name for precompiled header files.

IDE Equivalent

Windows

Visual Studio: **Precompiled Headers > Precompiled Header Output File**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

FR

Invokes the Microsoft C/C++ compiler and tells it to produce a BSCMAKE .sbr file with complete symbolic information.*

Syntax

Linux OS and macOS:

`None`

Windows OS:

`/FR[filename|dir]`

Arguments

filename	Is the name for the BSCMAKE `.sbr` file.
dir	Is the directory where the file should be placed. It can include *filename*.

Default

OFF	The compiler does not invoke the Microsoft* C/C++ compiler to produce a .sbr file.

Description

This option invokes the Microsoft* C/C++ compiler and tells it to produce a BSCMAKE .sbr file with complete symbolic information.

You can provide a name for the file. If you do not specify a file name, the .sbr file gets the same base name as the source file.

A synonym for option `/FR` is option `/Fr`. Option `/Fr` is a deprecated option.

IDE Equivalent

Windows

Visual Studio: **Browse Information > Browse Information File**

Browse Information > Enable Browse Information

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

fsource-asm

Produces an assembly listing with source code annotations.

Syntax

Linux OS:

`-fsource-asm`

macOS:

`-fsource-asm`

Windows OS:

`None`

Arguments

None

Default

OFF	No source code annotations appear in the assembly listing file, if one is produced.

Description

This option produces an assembly listing file with source code annotations. The assembly listing file shows the source code as interspersed comments.

To use this option, you must also specify option `-S`, which causes an assembly listing to be generated.

IDE Equivalent

None

Alternate Options

None

See Also

`S` compiler option

ftrapuv, Qtrapuv

Initializes stack local variables to an unusual value to aid error detection.

Syntax

Linux OS:

`-ftrapuv`

macOS:

`-ftrapuv`

Windows OS:

`/Qtrapuv`

Arguments

None

Default

OFF	The compiler does not initialize local variables.

Description

This option initializes stack local variables to an unusual value to aid error detection. Normally, these local variables should be initialized in the application. It also unmasks the floating-point invalid exception.

The option sets any uninitialized local variables that are allocated on the stack to a value that is typically interpreted as a very large integer or an invalid address. References to these variables are then likely to cause run-time errors that can help you detect coding errors.

This option sets option `-g` (Linux* and macOS) and `/Zi` or `/Z7` (Windows*), which changes the default optimization level from `O2` to `-O0` (Linux and macOS) or `/Od` (Windows). You can override this effect by explicitly specifying an `O` option setting.

If option `O2` and option `-ftrapuv` (Linux and macOS) or `/Qtrapuv` (Windows) are used together, you should specify option `-fp-speculation safe` (Linux and macOS) or `/Qfp-speculation:safe` (Windows) to prevent exceptions resulting from speculated floating-point operations from being trapped.

For more details on using options `-ftrapuv` and `/Qtrapuv` with compiler option `O`, see the article titled Don't optimize when using -ftrapuv for uninitialized variable detection.

Another way to detect uninitialized local scalar variables is by specifying keyword `uninit` for option `check`.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Run-Time > Initialize Stack Variables to an Unusual Value**

OS X

Xcode: **Code Generation > Initialize Stack Variables to an Unusual Value**

Alternate Options

None

See Also

g compiler option

Zi, Z7, ZI compiler option

`check` compiler option (see setting uninit)

fverbose-asm

Produces an assembly listing with compiler comments, including options and version information.

Syntax

Linux OS:

`-fverbose-asm`

`-fno-verbose-asm`

macOS:

`-fverbose-asm`

`-fno-verbose-asm`

Windows OS:

`None`

Arguments

None

Default

`-fno-verbose-asm`	No source code annotations appear in the assembly listing file, if one is produced.

Description

This option produces an assembly listing file with compiler comments, including options and version information.

To use this option, you must also specify `-S`, which sets `-fverbose-asm`.

If you do not want this default when you specify `-S`, specify `-fno-verbose-asm`.

IDE Equivalent

None

Alternate Options

None

See Also

`S` compiler option

g

Tells the compiler to generate a level of debugging information in the object file.

Syntax

Linux OS:

`-g[n]`

macOS:

`-g[n]`

Windows OS:

`See option Zi, Z7, ZI.`

Arguments

n	Is the level of debugging information to be generated. Possible values are:	
	0	Disables generation of symbolic debug information.
	1	Produces minimal debug information for performing stack traces.
	2	Produces complete debug information. This is the same as specifying `-g` with no *n*.
	3	Produces extra information that may be useful for some tools.

Default

-g or -g2	The compiler produces complete debug information.

Description

Option `-g` tells the compiler to generate symbolic debugging information in the object file, which increases the size of the object file.

The compiler does not support the generation of debugging information in assemblable files. If you specify this option, the resulting object file will contain debugging information, but the assemblable file will not.

This option turns off option `-O2` and makes option `-O0` the default unless option `-O2` (or higher) is explicitly specified in the same command line.

Specifying the `-g` or `-O0` option sets the `-fno-omit-frame-pointer` option. On Linux*, the -debug inline-debug-info option will be enabled by default if you compile with optimizations (option `-O2` or higher) and debugging is enabled (option `-g`).

Specifying the `-g` or `-O0` option sets the `-fno-omit-frame-pointer` option.

NOTE
When option `-g` is specified, debugging information is generated in the DWARF Version 3 format. Older versions of some analysis tools may require applications to be built with the `-gdwarf-2` option to ensure correct operation.

IDE Equivalent

Visual Studio

Visual Studio: None

Eclipse

Eclipse: **General > Include Debug Information**

Xcode

Xcode: **General > Generate Debug Information**

Alternate Options

Linux: None

Windows: /Zi, /Z7, /ZI

See Also

gdwarf compiler option
Zi, Z7, ZI compiler option
debug (Linux* and macOS) compiler option

gdwarf

Lets you specify a DWARF Version format when generating debug information.

Syntax

Linux OS:

`-gdwarf-n`

macOS:

`-gdwarf-n`

Windows OS:

None

Arguments

n	Is a value denoting the DWARF Version format to use. Possible values are:	
	`2`	Generates debug information using the DWARF Version 2 format.
	`3`	Generates debug information using the DWARF Version 3 format.
	`4`	Generates debug information using the DWARF Version 4 format. This setting is only available on Linux*.

Default

OFF	No debug information is generated. However, if compiler option `-g` is specified, debugging information is generated in the DWARF Version 3 format.

Description

This option lets you specify a DWARF Version format when generating debug information.

Note that older versions of some analysis tools may require applications to be built with the -gdwarf-2 option to ensure correct operation.

IDE Equivalent

None

Alternate Options

None

See Also

`g` compiler option

Gm

Enables a minimal rebuild.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Gm`

Arguments

None

Default

OFF	Minimal rebuilds are disabled.

Description

This option enables a minimal rebuild.

IDE Equivalent

Windows

Visual Studio: **Code Generation > Enable Minimal Rebuild**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

grecord-gcc-switches

Causes the command line options that were used to invoke the compiler to be appended to the DW_AT_producer attribute in DWARF debugging information.

Syntax

Linux OS:

`-grecord-gcc-switches`

macOS:

`None`

Windows OS:

`None`

Arguments

None

Default

OFF	The command line options that were used to invoke the compiler are not appended to the DW_AT_producer attribute in DWARF debugging information.

Description

This option causes the command line options that were used to invoke the compiler to be appended to the DW_AT_producer attribute in DWARF debugging information.

The options are concatenated with whitespace separating them from each other and from the compiler version.

IDE Equivalent

None

Alternate Options

None

gsplit-dwarf

Creates a separate object file containing DWARF debug information.

Syntax

Linux OS:

`-gsplit-dwarf`

macOS:

None

Windows OS:

None

Arguments

None

Default

OFF	No separate object file containing DWARF debug information is created.

Description

This option creates a separate object file containing DWARF debug information. It causes debug information to be split between the generated object (.o) file and the new DWARF object (.dwo) file.

The DWARF object file is not used by the linker, so this reduces the amount of debug information the linker must process and it results in a smaller executable file.

For this option to perform correctly, you must use binutils-2.24 or later. To debug the resulting executable, you must use gdb-7.6.1 or later.

> **NOTE**
> If you use the split executable with a tool that does not support the split DWARF format, it will behave as though the DWARF debug information is absent.

IDE Equivalent

None

Alternate Options

None

map-opts, Qmap-opts

Maps one or more compiler options to their equivalent on a different operating system.

Syntax

Linux OS:

`-map-opts`

macOS:

None

Windows OS:

`/Qmap-opts`

Arguments

None

Default

OFF	No platform mappings are performed.

Description

This option maps one or more compiler options to their equivalent on a different operating system. The result is output to `stdout`.

On Windows systems, the options you provide are presumed to be Windows options, so the options that are output to `stdout` will be Linux equivalents.

On Linux systems, the options you provide are presumed to be Linux options, so the options that are output to `stdout` will be Windows equivalents.

The tool can be invoked from the compiler command line or it can be used directly.

No compilation is performed when the option mapping tool is used.

This option is useful if you have both compilers and want to convert scripts or makefiles.

> **NOTE**
> Compiler options are mapped to their equivalent on the architecture you are using. For example, if you are using a processor with Intel® 64 architecture, you will only see equivalent options that are available on processors with Intel® 64 architecture.

IDE Equivalent

None

Alternate Options

None

Example

The following command line invokes the option mapping tool, which maps the Linux options to Windows-based options, and then outputs the results to `stdout`:

```
icc -map-opts -xP -O2
```

The following command line invokes the option mapping tool, which maps the Windows options to Linux-based options, and then outputs the results to `stdout`:

```
icl /Qmap-opts /QxP /O2
```

See Also

Compiler Option Mapping Tool

o

Specifies the name for an output file.

Syntax

Linux OS:

`-o filename`

macOS:

`-o filename`

Windows OS:

See option Fo.

Arguments

filename	Is the name for the output file. The space before *filename* is optional.

Default

OFF	The compiler uses the default file name for an output file.

Description

This option specifies the name for an output file as follows:

- If `-c` is specified, it specifies the name of the generated object file.
- If `-S` is specified, it specifies the name of the generated assembly listing file.
- If `-P` is specified, it specifies the name of the generated preprocessor file.

Otherwise, it specifies the name of the executable file.

IDE Equivalent

None

Alternate Options

Linux and macOS: None

Windows: `/Fe`

See Also

`Fo` compiler option
`Fe` compiler option

pch

Tells the compiler to use appropriate precompiled header files.

Syntax

Linux OS and macOS:

`-pch`

Windows OS:

None

Arguments

None

Default

OFF The compiler does not create or use precompiled headers unless you tell it to do so.

Description

This option tells the compiler to use appropriate precompiled header (PCH) files. If none are available, they are created as `sourcefile.pchi`. This option is supported for multiple source files.

The `-pch` option will use PCH files created from other sources if the headers files are the same. For example, if you compile `source1.cpp` using `-pch`, then `source1.pchi` is created. If you then compile `source2.cpp` using `-pch`, the compiler will use `source1.pchi` if it detects the same headers.

Caution
Depending on how you organize the header files listed in your sources, this option may increase compile times.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Precompiled Headers > Automatic Processing for Precompiled Headers**

OS X

Xcode: None

Alternate Options

None

Example

Consider the following command line:

```
icpc -pch source1.cpp source2.cpp
```

It produces the following output when `.pchi` files exist:

```
"source1.cpp": using precompiled header file"source1.pchi"
"source2.cpp": using precompiled header file "source2.pchi"
```

It produces the following output when `.pchi` files *do not* exist:

```
"source1.cpp": creating precompiled header file "source1.pchi"
"source2.cpp": creating precompiled header file "source2.pchi"
```

See Also

`-pch-create` compiler option

`-pch-dir` compiler option

`-pch-use` compiler option

pch-create

Tells the compiler to create a precompiled header file.

Syntax

Linux OS and macOS:

`-pch-create` *filename*

Windows OS:

None

Arguments

filename	Is the name for the precompiled header file. A space must appear before the file name. It can include a path.

Default

OFF	The compiler does not create or use precompiled headers unless you tell it to do so.

Description

This option tells the compiler to create a precompiled header (PCH) file. It is supported only for single source file compilations.

Note that the .pchi extension is not automatically appended to the file name.

This option cannot be used in the same compilation as the `-pch-use` option.

On Windows* systems, option `-pch-create` is equivalent to the `/Yc` option.

IDE Equivalent

None

Alternate Options

Linux and macOS: None

Windows: `/Yc`

Example

Consider the following command line:

```
icpc -pch-create /pch/foo.pchi foo.cpp
```

This creates the precompiled header file "/pch/foo.pchi".

See Also

`pch-use` compiler option

pch-dir

Tells the compiler the location for precompiled header files.

Syntax

Linux OS and macOS:

`-pch-dir` *dir*

Windows OS:

None

Arguments

dir	Is the path for precompiled header files. The path must exist.

Default

OFF	The compiler does not create or use precompiled headers unless you tell it to do so.

Description

This option tells the compiler the location for precompiled header files. It denotes where to find precompiled header files, and where new PCH files should be placed.

This option can be used with the `-pch`, `-pch-create`, and `-pch-use` options.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Precompiled Headers > Precompiled Headers' File Directory**

OS X

Xcode: **Precompiled Headers > Prefix Header**

Alternate Options

None

Example

Consider the following command line:

```
icpc -pch -pch-dir /pch source32.cpp
```

It produces the following output:

```
"source32.cpp": creating precompiled header file /pch/source32.pchi
```

See Also

`pch` compiler option

`pch-create` compiler option

`pch-use` compiler option

pch-use

Tells the compiler to use a precompiled header file.

Syntax

Linux OS and macOS:

`-pch-use` *`filename`*

Windows OS:

None

Arguments

filename	Is the name of the precompiled header file to use. A space must appear before the file name. It can include a path.

Default

OFF	The compiler does not create or use precompiled headers unless you tell it to do so.

Description

This option tells the compiler to use a precompiled header (PCH) file.

It is supported for multiple source files when all source files use the same .pchi file.

This option cannot be used in the same compilation as the `-pch-create` option.

To learn how to optimize compile times using the PCH options, see "Using Precompiled Header Files" in the User's Guide.

On Windows* systems, option `-pch-use` is equivalent to the `/Yu` option.

IDE Equivalent

None

Alternate Options

Linux and macOS: None

Windows: `/Yu`

Example

Consider the following command line:

```
icpc -pch-use /pch/source32.pchi source.cpp
```

It produces the following output:

```
"source.cpp": using precompiled header file /pch/source32.pchi
```

`-pch-create` compiler option

pdbfile

Lets you specify the name for a program database (PDB) file created by the linker.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/pdbfile[:`*`filename`*`]`

Arguments

filename	Is the name for the PDB file. It can include a path. If you do not specify a file extension, the extension .pdb is used.

Default

OFF	No PDB file is created unless you specify option `/Zi`. If you specify option `/Zi` the default filename is *executablename*.pdb.

Description

This option lets you specify the name for a program database (PDB) file created by the linker. This option does not affect where the compiler outputs debug information.

To use this option, you must also specify option `/debug:full` or `/Zi`.

If *filename* is not specified, the default file name used is the name of your file with an extension of .pdb.

IDE Equivalent

None

Alternate Options

None

See Also

print-multi-lib

Prints information about where system libraries should be found.

Syntax

Linux OS:

`-print-multi-lib`

macOS:

`-print-multi-lib`

Windows OS:

`None`

Arguments

None

Default

OFF	No information is printed unless the option is specified.

Description

This option prints information about where system libraries should be found, but no compilation occurs. On Linux* systems, it is provided for compatibility with gcc.

IDE Equivalent

None

Alternate Options

None

Qpchi

Enable precompiled header coexistence to reduce build time.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Qpchi`

`/Qpchi-`

Arguments

None

Default

ON	The compiler enables precompiled header coexistence.

Description

This option enables precompiled header (PCH) files generated by the Intel® C++ compiler and those generated by the Microsoft Visual C++* compiler to coexist, which reduces build time.

If build time is not an issue and you do not want an additional set of PCH files on your system, specify `/Qpchi-`.

IDE Equivalent

None

Alternate Options

None

Quse-msasm-symbols

Tells the compiler to use a dollar sign ("$") when producing symbol names.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Quse-msasm-symbols`

Arguments

None

Default

OFF	The compiler uses a period (".") when producing symbol names

Description

This option tells the compiler to use a dollar sign ("$") when producing symbol names.

Use this option if you require symbols in your .asm files to contain characters that are accepted by the MS assembler.

IDE Equivalent

None

Alternate Options

None

RTC

Enables checking for certain run-time conditions.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/RTC`*`option`*

Arguments

option	Specifies the condition to check. Possible values are 1, s, u, or c.

Default

OFF	No checking is performed for these run-time conditions.

Description

This option enables checking for certain run-time conditions. Using the /RTC option sets __MSVC_RUNTIME_CHECKS = 1.

Option	Description
/RTC1	This is the same as specifying /RTCsu.
/RTCs	Enables run-time checks of the stack frame.
/RTCu	Enables run-time checks for unintialized variables.
/RTCc	Enables checks for converting to smaller types.

IDE Equivalent

Windows

Visual Studio: **Code Generation > Basic Runtime Checks / Smaller Type Check**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

S

Causes the compiler to compile to an assembly file only and not link.

Syntax

Linux OS:

-S

macOS:

-S

Windows OS:

/S

Arguments

None

Default

OFF	Normal compilation and linking occur.

Description

This option causes the compiler to compile to an assembly file only and not link.

On Linux* and macOS systems, the assembly file name has a .s suffix. On Windows* systems, the assembly file name has an .asm suffix.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Output Files > Generate Assembler Source File**

OS X

Xcode: **Output Files > Generate Assembler Source File**

Alternate Options

Linux and macOS: None

Windows: `/Fa`

See Also

Fa compiler option

use-asm, Quse-asm

Tells the compiler to produce objects through the assembler. This is a deprecated option that may be removed in a future release.

Syntax

Linux OS:

`-use-asm`

`-no-use-asm`

macOS:

`-use-asm`

`-no-use-asm`

Windows OS:

`/Quse-asm`

`/Quse-asm-`

Arguments

None

Default

OFF	The compiler produces objects directly.

Description

This option tells the compiler to produce objects through the assembler.

This is a deprecated option that may be removed in a future release. There is no replacement option.

IDE Equivalent

None

Alternate Options

None

use-msasm

Enables the use of blocks and entire functions of assembly code within a C or C++ file.

Syntax

Linux OS:

`-use-msasm`

macOS:

`-use-msasm`

Windows OS:

`None`

Arguments

None

Default

OFF	The compiler allows a GNU*-style inline assembly format.

Description

This option enables the use of blocks and entire functions of assembly code within a C or C++ file.

It allows a Microsoft* MASM-style inline assembly block not a GNU*-style inline assembly block.

IDE Equivalent

None

Alternate Options

`-fasm-blocks`

V (Windows*)

Places the text string specified into the object file being generated by the compiler.

Syntax

Linux OS and macOS:

`None`

Windows OS:

`/V`*`string`*

Arguments

string	Is the text string to go into the object file.

Default

OFF	No text string is placed in the object file.

Description

Places the text string specified into the object file (.obj) being generated by the compiler.

This option places the text string specified into the object file (.obj) being generated by the compiler. The string also gets propagated into the executable file.

For example, this option is useful if you want to place the version number or copyright information into the object and executable.

If the string contains a space or tab, the string must be enclosed by double quotation marks ("). A backslash (\) must precede any double quotation marks contained within the string.

IDE Equivalent

None

Alternate Options

None

Y-

Tells the compiler to ignore all other precompiled header files.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Y-`

Arguments

None

Default

OFF	The compiler recognizes precompiled header files when certain compiler options are specified.

Description

This option tells the compiler to ignore all other precompiled header files.

IDE Equivalent

None

Alternate Options

None

See Also

`Yc` compiler option
`Yu` compiler option

Yc

Tells the compiler to create a precompiled header file.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Yc[`*`filename`*`]`

Arguments

filename	Is the name of a C/C++ header file, which is included in the source file using an #include preprocessor directive.

Default

OFF	The compiler does not create or use precompiled headers unless you tell it to do so.

Description

This option tells the compiler to create a precompiled header (PCH) file. It is supported only for single source file compilations.

When *filename* is specified, the compiler creates a precompiled header file from the headers in the C/C++ program up to and including the C/C++ header specified.

If you do not specify *filename*, the compiler compiles all code up to the end of the source file, or to the point in the source file where a hdrstop occurs. The default name for the resulting file is the name of the source file with extension .pchi.

This option cannot be used in the same compilation as the `/Yu` option.

On Linux* and macOS, option `/Yc` is equivalent to the `-pch-create` option.

IDE Equivalent

Windows

Visual Studio: **Precompiled Headers > Precompiled Header File**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

Linux and macOS: `-pch-create`

Windows: None

Example

If option /Fp is used, it names the PCH file. For example, consider the following command lines:

```
icl /c /Ycheader.h /Fpprecomp foo.cpp
icl /c /Yc /Fpprecomp foo.cpp
```

In both cases, the name of the PCH file is "precomp.pchi".

If the header file name is specified, the file name is based on the header file name. For example:

```
icl /c /Ycheader.h foo.cpp
```

In this case, the name of the PCH file is "header.pchi".

If no header file name is specified, the file name is based on the source file name. For example:

```
icl /c /Yc foo.cpp
```

In this case, the name of the PCH file is "foo.pchi".

See Also

`Yu` compiler option

`Fp` compiler option

Yd

Tells the compiler to add complete debugging information in all object files created from a precompiled header file when option /Zi or /Z7 is specified. This is a deprecated option that may be removed in a future release.

Syntax

Linux OS and macOS:

`None`

Windows OS:

`/Yd`

Arguments

None

Default

OFF	If `/Zi` or `/Z7` is specified when you are compiling with a precompiled header file using `/Yc` or `/Yu`, only one .obj file contains the common debugging information.

Description

This option tells the compiler that complete debugging information should be added to all object files created from a precompiled header (PCH) file when option `/Zi` or `/Z7` is specified. It affects precompiled header files that were created by specifying the `/Yc` option.

This is a deprecated option that may be removed in a future release. There is no replacement option.

Option `/Yd` has no effect unless option `/Zi` or `/Z7` is specified.

When option `/Zi` or `/Z7` is specified and option `/Yd` is omitted, the compiler stores common debugging information in only the first object (.obj) file created from the PCH file. This information is not inserted into any .obj files subsequently created from the PCH file, only cross-references to the information are inserted.

IDE Equivalent

None

Alternate Options

None

Yu

Tells the compiler to use a precompiled header file.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Yu[`*`filename`*`]`

Arguments

filename	Is the name of a C/C++ header file, which is included in the source file using an #include preprocessor directive.

Default

OFF	The compiler does not use precompiled header files unless it is told to do so.

Description

This option tells the compiler to use a precompiled header (PCH) file.

It is supported for multiple source files when all source files use the same .pchi file.

The compiler treats all code occurring before the header file as precompiled. It skips to just beyond the #include directive associated with the header file, uses the code contained in the PCH file, and then compiles all code after *filename*.

If you do not specify *filename*, the compiler will use a PCH with a name based on the source file name. If you specify option `/Fp`, it will use the PCH specified by that option.

When this option is specified, the compiler ignores all text, including declarations preceding the #include statement of the specified file.

This option cannot be used in the same compilation as the `/Yc` option.

On Linux* and macOS systems, option `/Yu` is equivalent to the `-pch-use` option.

IDE Equivalent

Windows

Visual Studio: **Precompiled Headers > Precompiled Header**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

Linux and macOS: `-pch-use`

Windows: None

Example

Consider the following command line:

```
icl /c /Yuheader.h bar.cpp
```

In this case, the name of the PCH file used is "header.pchi".

In the following command line, no filename is specified:

```
icl /Yu bar.cpp
```

In this case, the name of the PCH file used is "bar.pchi".

In the following command line, no filename is specified, but option `/Fp` is specified:

```
icl /Yu /Fpprecomp bar.cpp
```

In this case, the name of the PCH file used is "precomp.pchi".

See Also

`Yc` compiler option

Zi, Z7, ZI

Tells the compiler to generate full debugging information in either an object (.obj) file or a project database (PDB) file.

Syntax

Linux OS:

`See option g.`

macOS:

`See option g.`

Windows OS:

`/Zi`

`/Z7`

/ZI

Arguments

None

Default

OFF	No debugging information is produced.

Description

Option /Z7 tells the compiler to generate symbolic debugging information in the object (.obj) file for use with the debugger. No .pdb file is produced by the compiler.

Option /ZI is a synonym for option /Zi.

The /Zi option tells the compiler to generate symbolic debugging information in a program database (PDB) file for use with the debugger. Type information is placed in the .pdb file, and not in the .obj file, resulting in smaller object files in comparison to option /Z7.

When option /Zi is specified, two PDB files are created:

- The compiler creates the program database project.pdb. If you compile a file without a project, the compiler creates a database named vc*x*0.pdb, where *x* represents the major version of Visual C++, for example vc140.pdb.

  This file stores all debugging information for the individual object files and resides in the same directory as the project makefile. If you want to change this name, use option /Fd.
- The linker creates the program database executablename.pdb.

  This file stores all debug information for the .exe file and resides in the debug subdirectory. It contains full debug information, including function prototypes, not just the type information found in vc*x*0.pdb.

Both PDB files allow incremental updates. The linker also embeds the path to the .pdb file in the .exe or .dll file that it creates.

The compiler does not support the generation of debugging information in assemblable files. If you specify these options, the resulting object file will contain debugging information, but the assemblable file will not.

These options turn off option /O2 and make option /Od the default unless option /O2 (or higher) is explicitly specified in the same command line.

For more information about the /Z7, /Zi, and /ZI options, see the Microsoft documentation.

IDE Equivalent

Visual Studio

Visual Studio: **General > Generate Debug Information**

Eclipse

Eclipse: None

Xcode

Xcode: None

Alternate Options

Linux: -g

Windows: None

See Also

Fd compiler option

g compiler option

debug (Windows*) compiler option

Zo

Enables or disables generation of enhanced debugging information for optimized code.

Syntax

Linux OS:

None

macOS:

None

Windows OS:

/Zo

/Zo-

Arguments

None

Default

OFF	The compiler does not generate enhanced debugging information for optimized code.

Description

This option enables or disables the generation of additional debugging information for local variables and inlined routines when code optimizations are enabled. It should be used with option /Zi or /Z7 to allow improved debugging of optimized code.

Option /Zo enables generation of this enhanced debugging information. Option /Zo- disables this functionality.

For more information on code optimization, see option /O.

IDE Equivalent

None

Alternate Options

None

See Also

Zi, Z7, ZI compiler option

O compiler option

Preprocessor Options

This section contains descriptions for compiler options that pertain to preprocessing.

A, QA

Specifies an identifier for an assertion.

Syntax

Linux OS and macOS:

`-Aname[(value)]`

Windows OS:

`/QAname[(value)]`

Arguments

`name`	Is the identifier for the assertion.
`value`	Is an optional value for the assertion. If a value is specified, it must be within quotes, including the parentheses delimiting it.

Default

OFF	Assertions have no identifiers or symbol names.

Description

This option specifies an identifier (symbol name) for an assertion. It is equivalent to an #assert preprocessing directive.

Note that this option is not the positive form of the C++ `/QA-` option.

On Linux* systems, because GCC has deprecated assertions, this option has no effect.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: None

OS X

Xcode: **Preprocessor > Undefine All Preprocessor Definitions**

Alternate Options

None

Example

To make an assertion for the identifier fruit with the associated values orange and banana use the following command.

On Windows* systems:

```
icl /QA"fruit(orange,banana)" prog1.cpp
```

On Linux* systems:

```
icpc -A"fruit(orange,banana)" prog1.cpp
```

On macOS systems:

```
icl++ -A"fruit(orange,banana)" prog1.cpp
```

```
icpc -A"fruit(orange,banana)" prog1.cpp
```

B

Specifies a directory that can be used to find include files, libraries, and executables.

Syntax

Linux OS:

-B*dir*

macOS:

-B*dir*

Windows OS:

None

Arguments

dir	Is the directory to be used. If necessary, the compiler adds a directory separator character at the end of *dir*.

Default

OFF	The compiler looks for files in the directories specified in your PATH environment variable.

Description

This option specifies a directory that can be used to find include files, libraries, and executables.

The compiler uses *dir* as a prefix.

For include files, the *dir* is converted to -I/*dir*/include. This command is added to the front of the includes passed to the preprocessor.

For libraries, the *dir* is converted to -L/*dir*. This command is added to the front of the standard -L inclusions before system libraries are added.

For executables, if *dir* contains the name of a tool, such as ld or as, the compiler will use it instead of those found in the default directories.

The compiler looks for include files in *dir* /include while library files are looked for in *dir*.

On Linux* systems, another way to get the behavior of this option is to use the environment variable GCC_EXEC_PREFIX.

IDE Equivalent

None

Alternate Options

None

C

Places comments in preprocessed source output.

Syntax

Linux OS:

`-C`

macOS:

`-C`

Windows OS:

`/C`

Arguments

None

Default

OFF	No comments are placed in preprocessed source output.

Description

This option places (or preserves) comments in preprocessed source output.

Comments following preprocessing directives, however, are not preserved.

IDE Equivalent

Windows

Visual Studio: **Preprocessor > Keep Comments**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

Example

The following commands cause the compiler to preserve comments in the prog1.i preprocessed file.

On Windows* systems:

```
icl /C /P prog1.cpp prog2.cpp
```

On Linux* systems:

```
icpc -C -P prog1.cpp prog2.cpp
```

On macOS systems:

```
icpc -C -P prog1.cpp prog2.cpp
```

D

Defines a macro name that can be associated with an optional value.

Syntax

Linux OS:

`-Dname[=value]`

macOS:

`-Dname[=value]`

Windows OS:

`/Dname[=value]`

Arguments

name	Is the name of the macro.
value	Is an optional integer or an optional character string delimited by double quotes; for example, `D`*name=string*.

Default

OFF	Only default symbols or macros are defined.

Description

Defines a macro name that can be associated with an optional value. This option is equivalent to a #define preprocessor directive.

If a *value* is not specified, *name* is defined as "1".

IDE Equivalent

Windows

Visual Studio: **Preprocessor > Preprocessor Definitions**

Linux

Eclipse: **Preprocessor > Preprocessor Definitions**

OS X

Xcode: **Preprocessor > Preprocessor Definitions**

Alternate Options

None

Example

To define a macro called SIZE with the value 100, enter the following command:

On Windows* systems:

```
icl /DSIZE=100 prog1.cpp
```

On Linux* systems:

```
icpc -DSIZE=100 prog1.cpp
```

On macOS systems:

```
icpc -DSIZE=100 prog1.cpp
```

If you define a macro, but do not assign a value, the compiler defaults to 1 for the value of the macro.

See Also

Additional Predefined Macros

dD, QdD

Same as option -dM, but outputs #define directives in preprocessed source.

Syntax

Linux OS:

`-dD`

macOS:

`-dD`

Windows OS:

`/QdD`

Arguments

None

Default

OFF	The compiler does not output #define directives.

Description

Same as `-dM`, but outputs `#define` directives in preprocessed source. To use this option, you must also specify the `E` option.

IDE Equivalent

None

Alternate Options

None

dM, QdM

Tells the compiler to output macro definitions in effect after preprocessing.

Syntax

Linux OS:

`-dM`

macOS:

`-dM`

Windows OS:

`/QdM`

Arguments

None

Default

OFF	The compiler does not output macro definitions after preprocessing.

Description

This option tells the compiler to output macro definitions in effect after preprocessing. To use this option, you must also specify option `E`.

IDE Equivalent

None

Alternate Options

None

See Also

`E` compiler option

dN, QdN

Same as option -dD, but output #define directives contain only macro names.

Syntax

Linux OS and macOS:

`-dN`

Windows OS:

`/QdN`

Arguments

None

Default

OFF	The compiler does not output #define directives.

Description

Same as `-dD`, but output `#define` directives contain only macro names. To use this option, you must also specify option `E`.

IDE Equivalent

None

Alternate Options

None

E

Causes the preprocessor to send output to stdout.

Syntax

Linux OS:

`-E`

macOS:

`-E`

Windows OS:

`/E`

Arguments

None

Default

OFF	Preprocessed source files are output to the compiler.

Description

This option causes the preprocessor to send output to `stdout`. Compilation stops when the files have been preprocessed.

When you specify this option, the compiler's preprocessor expands your source module and writes the result to `stdout`. The preprocessed source contains #line directives, which the compiler uses to determine the source file and line number.

IDE Equivalent

None

Alternate Options

None

Example

To preprocess two source files and write them to `stdout`, enter the following command:

On Windows* systems:

```
icl /E prog1.cpp prog2.cpp
```

On Linux* systems:

```
icpc -E prog1.cpp prog2.cpp
```

On macOS systems:

```
icl -E prog1.cpp prog2.cpp
```

```
icpc -E prog1.cpp prog2.cpp
```

EP

Causes the preprocessor to send output to stdout, omitting #line directives.

Syntax

Linux OS:

`-EP`

macOS:

`-EP`

Windows OS:

`/EP`

Arguments

None

Default

OFF	Preprocessed source files are output to the compiler.

Description

This option causes the preprocessor to send output to `stdout`, omitting #line directives.

If you also specify option `P` or Linux* option `F`, the preprocessor will write the results (without #line directives) to a file instead of `stdout`.

IDE Equivalent

Windows

Visual Studio: **Preprocessor > Preprocess Suppress Line Numbers**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

Example

To preprocess to `stdout` omitting #line directives, enter the following command:

On Windows* systems:

```
icl /EP prog1.cpp prog2.cpp
```

On Linux* and macOS systems:

```
icpc -EP prog1.cpp prog2.cpp
```

FI

Tells the preprocessor to include a specified file name as the header file.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/FI`*`filename`*

Arguments

filename	Is the file name to be included as the header file.

Default

OFF	The compiler uses default header files.

Description

This option tells the preprocessor to include a specified file name as the header file.

The file specified with `/FI` is included in the compilation before the first line of the primary source file.

IDE Equivalent

Windows

Visual Studio: **Advanced > Forced Include File**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

gcc, gcc-sys

Determines whether certain GNU macros are defined or undefined.

Syntax

Linux OS:

`-gcc`

`-no-gcc`

-gcc-sys

macOS:

-gcc

-no-gcc

-gcc-sys

Windows OS:

None

Arguments

None

Default

-gcc	The compiler defines the GNU macros `__GNUC__`, `__GNUC_MINOR__`, and `__GNUC_PATCHLEVEL__`

Description

This option determines whether the GNU macros `__GNUC__`, `__GNUC_MINOR__`, and `__GNUC_PATCHLEVEL__` are defined or undefined.

Option	Description
-gcc	Defines GNU macros.
-no-gcc	Undefines GNU macros.
-gcc-sys	Defines GNU macros only during compilation of system headers.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Preprocessor > gcc Predefined Macro Enablement**

OS X

Xcode: **Preprocessor > Predefine gcc Macros**

Alternate Options

None

gcc-include-dir

Controls whether the gcc-specific include directory is put into the system include path.

Syntax

Linux OS:

-gcc-include-dir

`-no-gcc-include-dir`

macOS:

`None`

Windows OS:

`None`

Arguments

None

Default

`-gcc-include-dir`	The gcc-specific include directory is put into the system include path.

Description

This option controls whether the gcc-specific include directory is put into the system include path.

If you specify `-no-gcc-include-dir`, the gcc-specific include directory will not be put into the system include path.

IDE Equivalent

None

Alternate Options

None

H, QH

Tells the compiler to display the include file order and continue compilation.

Syntax

Linux OS:

`-H`

macOS:

`-H`

Windows OS:

`/QH`

Arguments

None

Default

OFF	Compilation occurs as usual.

Description

This option tells the compiler to display the include file order and continue compilation.

IDE Equivalent

None

Alternate Options

None

I

Specifies an additional directory to search for include files.

Syntax

Linux OS:

`-Idir`

macOS:

`-Idir`

Windows OS:

`/Idir`

Arguments

dir	Is the additional directory for the search.

Default

OFF	The default directory is searched for include files.

Description

This option specifies an additional directory to search for include files. To specify multiple directories on the command line, repeat the include option for each directory.

IDE Equivalent

Windows

Visual Studio: **General > Additional Include Directories**

Linux

Eclipse: **Preprocessor > Additional Include Directories**

OS X

Xcode: **Preprocessor > Additional Include Directories**

Alternate Options

None

I-

Splits the include path.

Syntax

Linux OS:

`-I-`

macOS:

`-I-`

Windows OS:

`/I-`

Arguments

None

Default

OFF	The default directory is searched for include files.

Description

This option splits the include path. It prevents the use of the current directory as the first search directory for '#include "file"'.

If you specify directories using the `I` option *before* you specify option `I-`, the directories are searched only for the case of '#include "file"'; they are not searched for '#include <file>'.

If you specify directories using the `I` option *after* you specify option `I-`, these directories are searched for all '#include' directives.

This option has no effect on option `nostdinc++`, which searches the standard system directories for header files.

This option is provided for compatibility with gcc.

IDE Equivalent

None

Alternate Options

None

See Also

`I` compiler option
`nostdinc++` compiler option

icc, Qicl

Determines whether certain Intel®-specific compiler macros are defined or undefined.

Syntax

Linux OS:

`-icc`

`-no-icc`

macOS:

`-icc`

`-no-icc`

Windows OS:

`/Qicl`

`/Qicl-`

Arguments

None

Default

`-icc` or `/Qicl`	The __INTEL_COMPILER macros are set to represent the current version of the compiler.

Description

This option determines whether certain Intel®-specific compiler macros are defined or undefined.

If you specify option `-no-icc` or `/Qicl-` , the compiler undefines the __INTEL_COMPILER macros. These macros are defined by default or by specifying `-icc` or `/Qicl`.

IDE Equivalent

None

Alternate Options

None

idirafter

Adds a directory to the second include file search path.

Syntax

Linux OS:

`-idirafter`*`dir`*

macOS:

`-idirafter`*`dir`*

Windows OS:

`None`

Arguments

dir	Is the name of the directory to add.

Default

OFF	Include file search paths include certain default directories.

Description

This option adds a directory to the second include file search path (after `-I`).

IDE Equivalent

None

Alternate Options

None

imacros

Allows a header to be specified that is included in front of the other headers in the translation unit.

Syntax

Linux OS:

`-imacros filename`

macOS:

`-imacros filename`

Windows OS:

`None`

Arguments

filename	Name of header file.

Default

OFF

Description

Allows a header to be specified that is included in front of the other headers in the translation unit.

IDE Equivalent

None

Alternate Options

None

iprefix

Lets you indicate the prefix for referencing directories that contain header files.

Syntax

Linux OS:

`-iprefix prefix`

macOS:

`-iprefix` *`prefix`*

Windows OS:

`None`

Arguments

prefix	Is the prefix to use.

Default

OFF	No prefix is included.

Description

Options for indicating the prefix for referencing directories containing header files. Use *prefix* with option `-iwithprefix` as a prefix.

IDE Equivalent

None

Alternate Options

None

iquote

Adds a directory to the front of the include file search path for files included with quotes but not brackets.

Syntax

Linux OS:

`-iquote` *`dir`*

macOS:

`-iquote` *`dir`*

Windows OS:

`None`

Arguments

dir	Is the name of the directory to add.

Default

OFF	The compiler does not add a directory to the front of the include file search path.

Description

Add directory to the front of the include file search path for files included with quotes but not brackets.

IDE Equivalent

None

Alternate Options

None

isystem

Specifies a directory to add to the start of the system include path.

Syntax

Linux OS:

`-isystemdir`

macOS:

`-isystemdir`

Windows OS:

`None`

Arguments

dir	Is the directory to add to the system include path.

Default

OFF	The default system include path is used.

Description

This option specifies a directory to add to the system include path. The compiler searches the specified directory for include files after it searches all directories specified by the `-I` compiler option but before it searches the standard system directories.

On Linux* systems, this option is provided for compatibility with gcc.

IDE Equivalent

None

Alternate Options

None

iwithprefix

Appends a directory to the prefix passed in by -iprefix and puts it on the include search path at the end of the include directories.

Syntax

Linux OS:

`-iwithprefixdir`

macOS:

`-iwithprefixdir`

Windows OS:

`None`

Arguments

dir	Is the include directory.

Default

OFF

Description

This option appends a directory to the prefix passed in by `-iprefix` and puts it on the include search path at the end of the include directories.

IDE Equivalent

None

Alternate Options

None

iwithprefixbefore

Similar to -iwithprefix except the include directory is placed in the same place as -I command-line include directories.

Syntax

Linux OS:

`-iwithprefixbefore`*`dir`*

macOS:

`-iwithprefixbefore`*`dir`*

Windows OS:

`None`

Arguments

dir	Is the include directory.

Default

OFF

Description

Similar to `-iwithprefix` except the include directory is placed in the same place as `-I` command-line include directories.

IDE Equivalent

None

Alternate Options

None

Kc++, TP

Tells the compiler to process all source or unrecognized file types as C++ source files. This is a deprecated option that may be removed in a future release.

Syntax

Linux OS:

`-Kc++`

macOS:

`-Kc++`

Windows OS:

`/TP`

Arguments

None

Default

OFF	The compiler uses default rules for determining whether a file is a C++ source file.

Description

This option tells the compiler to process all source or unrecognized file types as C++ source files.

This is a deprecated option that may be removed in a future release. The replacement option for `Kc++` is `-x c++`; the replacement option for `/TP` is `/Tp<file>`.

IDE Equivalent

Windows

Visual Studio: **Advanced > Compile As**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

Linux and macOS: `-x c++`

Windows: `/Tp`

M, QM

Tells the compiler to generate makefile dependency lines for each source file.

Syntax

Linux OS:

`-M`

macOS:

`-M`

Windows OS:

`/QM`

Arguments

None

Default

OFF	The compiler does not generate makefile dependency lines for each source file.

Description

This option tells the compiler to generate makefile dependency lines for each source file, based on the #include lines found in the source file.

IDE Equivalent

None

Alternate Options

None

MD, QMD

Preprocess and compile, generating output file containing dependency information ending with extension .d.

Syntax

Linux OS:

`-MD`

macOS:

`-MD`

Windows OS:

`/QMD`

Arguments

None

Default

OFF	The compiler does not generate dependency information.

Description

Preprocess and compile, generating output file containing dependency information ending with extension .d.

IDE Equivalent

None

Alternate Options

None

MF, QMF

Tells the compiler to generate makefile dependency information in a file.

Syntax

Linux OS:

`-MF`*`filename`*

macOS:

`-MF`*`filename`*

Windows OS:

`/QMF`*`filename`*

Arguments

filename	Is the name of the file where the makefile dependency information should be placed.

Default

OFF	The compiler does not generate makefile dependency information in files.

Description

This option tells the compiler to generate makefile dependency information in a file. To use this option, you must also specify `/QM` or `/QMM`.

IDE Equivalent

None

Alternate Options

None

See Also

`QM` compiler option
`QMM` compiler option

MG, QMG

Tells the compiler to generate makefile dependency lines for each source file.

Syntax

Linux OS:

`-MG`

macOS:

`-MG`

Windows OS:

`/QMG`

Arguments

None

Default

OFF	The compiler does not generate makefile dependency information in files.

Description

This option tells the compiler to generate makefile dependency lines for each source file. It is similar to `/QM`, but it treats missing header files as generated files.

IDE Equivalent

None

Alternate Options

None

See Also

`QM` compiler option

MM, QMM

Tells the compiler to generate makefile dependency lines for each source file.

Syntax

Linux OS:

`-MM`

macOS:

`-MM`

Windows OS:

`/QMM`

Arguments

None

Default

OFF	The compiler does not generate makefile dependency information in files.

Description

This option tells the compiler to generate makefile dependency lines for each source file. It is similar to `/QM`, but it does not include system header files.

IDE Equivalent

None

Alternate Options

None

See Also

`QM` compiler option

MMD, QMMD

Tells the compiler to generate an output file containing dependency information.

Syntax

Linux OS:

`-MMD`

macOS:

`-MMD`

Windows OS:

`/QMMD`

Arguments

None

Default

OFF	The compiler does not generate an output file containing dependency information.

Description

This option tells the compiler to preprocess and compile a file, then generate an output file (with extension `.d`) containing dependency information.

It is similar to `/QMD`, but it does not include system header files.

IDE Equivalent

None

Alternate Options

None

MP

Tells the compiler to add a phony target for each dependency.

Syntax

Linux OS:

`-MP`

macOS:

`-MP`

Windows OS:

`None (see below)`

Arguments

None

Default

OFF	The compiler does not generate dependency information unless it is told to do so.

Description

This option tells the compiler to add a phony target for each dependency.

Note that this option is not related to Windows* option /MP.

IDE Equivalent

None

Alternate Options

None

MQ

Changes the default target rule for dependency generation.

Syntax

Linux OS:

`-MQ`*`target`*

macOS:

`-MQ`*`target`*

Windows OS:

`None`

Arguments

target	Is the target rule to use.

Default

OFF	The default target rule applies to dependency generation.

Description

This option changes the default target rule for dependency generation. It is similar to `-MT`, but quotes special Make characters.

IDE Equivalent

None

Alternate Options

None

MT, QMT

Changes the default target rule for dependency generation.

Syntax

Linux OS:

`-MT`*`target`*

macOS:

`-MT`*`target`*

Windows OS:

`/QMT`*`target`*

Arguments

target	Is the target rule to use.

Default

OFF	The default target rule applies to dependency generation.

Description

This option changes the default target rule for dependency generation.

IDE Equivalent

None

Alternate Options

None

nostdinc++

Do not search for header files in the standard directories for C++, but search the other standard directories.

Syntax

Linux OS:

`-nostdinc++`

macOS:

`-nostdinc++`

Windows OS:

`None`

Arguments

None

Default

OFF

Description

Do not search for header files in the standard directories for C++, but search the other standard directories.

IDE Equivalent

None

Alternate Options

None

P

Tells the compiler to stop the compilation process and write the results to a file.

Syntax

Linux OS:

`-P`

macOS:

`-P`

Windows OS:

`/P`

Arguments

None

Default

OFF	Normal compilation is performed.

Description

This option tells the compiler to stop the compilation process after C or C++ source files have been preprocessed and write the results to files named according to the compiler's default file-naming conventions.

On Linux systems, this option causes the preprocessor to expand your source module and direct the output to a `.i` file instead of `stdout`. Unlike the `-E` option, the output from `-P` on Linux does not include #line number directives. By default, the preprocessor creates the name of the output file using the prefix of the source file name with a `.i` extension. You can change this by using the `-o` option.

IDE Equivalent

Visual Studio: **Preprocessor > Generate Preprocessed File**

Eclipse: None

Xcode: None

Alternate Options

Linux and macOS: `-F`

Windows: None

pragma-optimization-level

Specifies which interpretation of the optimization_level pragma should be used if no prefix is specified.

Syntax

Linux OS:

`-pragma-optimization-level=`*`interpretation`*

macOS:

`-pragma-optimization-level=`*`interpretation`*

Windows OS:

None

Arguments

interpretation	Compiler-specific interpretation of `optimization_level` pragma. Possible values are:	
	`Intel`	Specify the Intel interpretation.
	`GCC`	Specify the GCC interpretation.

Default

`-pragma-optimization-level=Intel`	Use the Intel interpretation of the `optimization_level` pragma.

Description

Specifies which interpretation of the `optimization_level` pragma should be used if no prefix is specified.

IDE Equivalent

None

Alternate Options

None

u (Windows*)

Disables all predefined macros and assertions.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/u`

Arguments

None

Default

OFF	Defined preprocessor values are in effect until they are undefined.

Description

This option disables all predefined macros and assertions.

IDE Equivalent

Windows

Visual Studio: **Preprocessor > Undefine All Preprocessor Definitions**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

U

Undefines any definition currently in effect for the specified macro.

Syntax

Linux OS:

`-U`*`name`*

macOS:

`-U`*`name`*

Windows OS:

`/Uname`

Arguments

name	Is the name of the macro to be undefined.

Default

OFF	Macro definitions are in effect until they are undefined.

Description

This option undefines any definition currently in effect for the specified macro. It is equivalent to an #undef preprocessing directive.

On Windows systems, use the `/u` option to undefine all previously defined preprocessor values.

IDE Equivalent

Windows

Visual Studio: **Preprocessor > Undefine Preprocessor Definitions**

Linux

Eclipse: **Preprocessor > Undefine Preprocessor Definitions**

OS X

Xcode: **Preprocessor > Undefine Preprocessor Definitions**

Alternate Options

None

Example

To undefine a macro, enter the following command:

On Windows* systems:

```
icl /Uia64 prog1.cpp
```

On Linux* systems:

```
icpc -Uia64 prog1.cpp
```

On macOS systems:

```
icpc -Uia64 prog1.cpp
```

If you attempt to undefine an ANSI C macro, the compiler will emit an error:

```
invalid macro undefinition: <name of macro>
```

See Also

undef

Disables all predefined macros.

Syntax

Linux OS:

`-undef`

macOS:

`-undef`

Windows OS:

`None`

Arguments

None

Default

OFF	Defined macros are in effect until they are undefined.

Description

This option disables all predefined macros.

IDE Equivalent

None

Alternate Options

None

X

Removes standard directories from the include file search path.

Syntax

Linux OS:

`-X`

macOS:

`-X`

Windows OS:

`/X`

Arguments

None

Default

OFF	Standard directories are in the include file search path.

Description

This option removes standard directories from the include file search path. It prevents the compiler from searching the default path specified by the INCLUDE environment variable.

On Linux* and macOS systems, specifying `-X` (or `-noinclude`) prevents the compiler from searching in `/usr/include` for files specified in an INCLUDE statement.

You can use this option with the `I` option to prevent the compiler from searching the default path for include files and direct it to use an alternate path.

IDE Equivalent

Windows

Visual Studio: **Preprocessor > Ignore Standard Include Path**

Linux

Eclipse: **Preprocessor > Ignore Standard Include Path**

OS X

Xcode: **Preprocessor > Ignore Standard Include Path**

Alternate Options

Linux and macOS: `-nostdinc`

Windows: None

See Also

`I` compiler option

Component Control Options

This section contains descriptions for compiler options that pertain to component control.

Qinstall

Specifies the root directory where the compiler installation was performed.

Syntax

Linux OS:

`-Qinstall`*`dir`*

macOS:

`-Qinstall`*`dir`*

Windows OS:

`None`

Arguments

dir	Is the root directory where the installation was performed.

Default

OFF	The default root directory for compiler installation is searched for the compiler.

Description

This option specifies the root directory where the compiler installation was performed. It is useful if you want to use a different compiler or if you did not use a shell script to set your environment variables.

IDE Equivalent

None

Alternate Options

None

Qlocation

Specifies the directory for supporting tools.

Syntax

Linux OS:

`-Qlocation,`*`string`*`,`*`dir`*

macOS:

`-Qlocation,`*`string`*`,`*`dir`*

Windows OS:

`/Qlocation,`*`string`*`,`*`dir`*

Arguments

string	Is the name of the tool.
dir	Is the directory (path) where the tool is located.

Default

OFF	The compiler looks for tools in a default area.

Description

This option specifies the directory for supporting tools.

string can be any of the following:

- c - Indicates the Intel® C++ Compiler Classic.
- cpp (or fpp) - Indicates the Intel® C++ preprocessor.
- cxxinc - Indicates C++ header files.
- cinc - Indicates C header files.
- asm - Indicates the assembler.
- link - Indicates the linker.
- prof - Indicates the profiler.
- On Windows* systems, the following is also available:
  - masm - Indicates the Microsoft assembler.
- On Linux* and macOS systems, the following are also available:
  - as - Indicates the assembler.
  - gas - Indicates the GNU assembler. This setting is for Linux* only.
  - ld - Indicates the loader.

- gld - Indicates the GNU loader. This setting is for Linux* only.
- lib - Indicates an additional library.
- crt - Indicates the crt%.o files linked into executables to contain the place to start execution.

On Windows and macOS systems, you can also specify a tool command name.

The following shows an example on macOS systems:

```
-Qlocation,ld,/usr/bin              ! This tells the driver to use /usr/bin/ld for the loader
-Qlocation,ld,/usr/bin/gld          ! This tells the driver to use /usr/bin/gld as the loader
```

The following shows an example on Windows* systems:

```
/Qlocation,link,"c:\Program Files\tools\"            ! This tells the driver to use c:\Program
Files\tools\link.exe for the loader
/Qlocation,link,"c:\Program Files\tools\my_link.exe" ! This tells the driver to use c:\Program
Files\tools\my_link.exe as the loader
```

IDE Equivalent

None

Alternate Options

None

See Also

`Qoption` compiler option

Qoption

Passes options to a specified tool.

Syntax

Linux OS:

`-Qoption,`*`string`*`,`*`options`*

macOS:

`-Qoption,`*`string`*`,`*`options`*

Windows OS:

`/Qoption,`*`string`*`,`*`options`*

Arguments

string	Is the name of the tool.
options	Are one or more comma-separated, valid options for the designated tool. Note that certain tools may require that options appear within quotation marks (" ").

Default

OFF	No options are passed to tools.

Description

This option passes options to a specified tool.

If an argument contains a space or tab character, you must enclose the entire argument in quotation marks (" "). You must separate multiple arguments with commas.

string can be any of the following:

- cpp - Indicates the preprocessor for the compiler.
- c - Indicates the Intel® C++ Compiler Classic.
- asm - Indicates the assembler.
- link - Indicates the linker.
- prof - Indicates the profiler.
- On Windows* systems, the following is also available:
  - masm - Indicates the Microsoft assembler.
- On Linux* and macOS systems, the following are also available:
  - as - Indicates the assembler.
  - gas - Indicates the GNU assembler.
  - ld - Indicates the loader.
  - gld - Indicates the GNU loader.
  - lib - Indicates an additional library.
  - crt - Indicates the crt%.o files linked into executables to contain the place to start execution.

IDE Equivalent

None

Alternate Options

None

`Qlocation` compiler option

Language Options

This section contains descriptions for compiler options that pertain to language compatibility, conformity, etc.

ansi

Enables language compatibility with the gcc option ansi.

Syntax

Linux OS:

`-ansi`

macOS:

`-ansi`

Windows OS:

None

Arguments

None

Default

OFF	GNU C++ is more strongly supported than ANSI C.

Description

This option enables language compatibility with the gcc option `-ansi` and provides the same level of ANSI standard conformance as that option.

This option sets option `fmath-errno`.

If you want strict ANSI conformance, use the -strict-ansi option.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Language > ANSI Conformance**

OS X

Xcode: **Language > C Language Dialect and Language > C++ Language Dialect**

Alternate Options

None

check

Checks for certain conditions at run time.

Syntax

Linux OS and macOS:

`-check=`*`keyword`*`[, `*`keyword`*`...]`

Windows OS:

`/check:`*`keyword`*`[, `*`keyword`*`...]`

Arguments

keyword

Specifies the conditions to check. Possible values are:

`[no]conversions`	Determines whether checking occurs for converting to smaller types. Keyword `conversions` enables this checking.
`[no]stack`	Determines whether checking occurs on the stack frame. Keyword `stack` enables this checking. If `stack` is specified, the stack is checked for buffer overruns and buffer underruns. This option also enforces local variables initialization and stack pointer verification.

`[no]uninit`	Determines whether checking occurs for uninitialized variables. Keyword `uninit` enables this checking. If a variable is read before it is written, a run-time error routine will be called. Run-time checking of undefined variables is only implemented on local, scalar variables. It is not implemented on dynamically allocated variables, extern variables or static variables. It is not implemented on structs, classes, unions or arrays.

Default

`noconversions`
`nostack`
`nouninit`
	No checking is performed for the above run-time conditions.

Description

This option checks for certain conditions at run time.

On Windows* systems, this option disables any default or specified optimizations and applies the `/Od` level of optimization. If you specified optimizations, the compiler emits warning diagnostics for the disabled optimizations.

On Linux* and macOS systems, this option may disable some optimizations.

> **NOTE**
> This option requires library support. Depending on the platform, the required library is either in your operating system run-time environment or in your compiler package.

IDE Equivalent

Visual Studio

Visual Studio: None

Eclipse

Eclipse: **Runtime > Check Stack Frame** (-check=stack)

Runtime > Check Type Conversions (-check=conversions)

Runtime > Check Uninitialized Variables (-check=uninit)

Xcode

Xcode: **Runtime > Check Stack Frame** (-check=stack)

Runtime > Check Type Conversions (-check=conversions)

Runtime > Check Uninitialized Variables (-check=uninit)

Alternate Options

`check:conversions` Linux and macOS: None

	Windows: `/RTCc`
`check:stack`	Linux and macOS: None Windows: `/RTCs`
`check:uninit`	Linux and macOS: None Windows: `/RTCu`

early-template-check

Lets you semantically check template function template prototypes before instantiation.

Syntax

Linux OS and macOS:

`-early-template-check`

`-no-early-template-check`

Windows OS:

`None`

Arguments

None

Default

`-no-early-template-check`	The prototype instantiation of function templates and function members of class templates is deferred.

Description

Lets you semantically check template function template prototypes before instantiation. On Linux* platforms, gcc 3.4 (or newer) compatibilty modes must be in effect. For all macOS platforms, gcc 4.0 (or newer) is required.

IDE Equivalent

None

Alternate Options

None

fblocks

Determines whether Apple blocks are enabled or disabled.*

Syntax

Linux OS:

`None`

macOS:

`-fblocks`

`-fno-blocks`

Windows OS:

`None`

Arguments

None

Default

`-fblocks`	Apple* blocks are enabled.

Description

This option determines whether Apple* blocks (block variable declarations) are enabled or disabled.

If you want to disable Apple* blocks, specify -fno-blocks.

To use this feature, macOS 10.6 or greater is required.

IDE Equivalent

None

Alternate Options

None

ffriend-injection

Causes the compiler to inject friend functions into the enclosing namespace.

Syntax

Linux OS and macOS:

`-ffriend-injection`

`-fno-friend-injection`

Windows OS:

`None`

Arguments

None

Default

`-fno-friend-injection`	The compiler does not inject friend functions into the enclosing namespace. A friend function that is not declared in an enclosing scope can only be found using argument-dependent lookup.

Description

This option causes the compiler to inject friend functions into the enclosing namespace, so they are visible outside the scope of the class in which they are declared.

On Linux systems, in gcc versions 4.1 or later, this is not the default behavior. This option allows compatibility with gcc 4.0 or earlier.

IDE Equivalent

None

Alternate Options

None

fno-gnu-keywords

Tells the compiler to not recognize typeof as a keyword.

Syntax

Linux OS:

`-fno-gnu-keywords`

macOS:

`-fno-gnu-keywords`

Windows OS:

`None`

Arguments

None

Default

OFF	Keyword `typeof` is recognized.

Description

Tells the compiler to not recognize `typeof` as a keyword.

IDE Equivalent

None

Alternate Options

None

fno-implicit-inline-templates

Tells the compiler to not emit code for implicit instantiations of inline templates.

Syntax

Linux OS:

`-fno-implicit-inline-templates`

macOS:

`-fno-implicit-inline-templates`

Windows OS:

`None`

Arguments

None

Default

OFF	The compiler handles inlines so that compilations, with and without optimization, will need the same set of explicit instantiations.

Description

This option tells the compiler to not emit code for implicit instantiations of inline templates.

IDE Equivalent

None

Alternate Options

None

fno-implicit-templates

Tells the compiler to not emit code for non-inline templates that are instantiated implicitly.

Syntax

Linux OS:

`-fno-implicit-templates`

macOS:

`-fno-implicit-templates`

Windows OS:

`None`

Arguments

None

Default

OFF	The compiler handles inlines so that compilations, with and without optimization, will need the same set of explicit instantiations.

Description

This option tells the compiler to not emit code for non-inline templates that are instantiated implicitly, but to only emit code for explicit instantiations.

IDE Equivalent

None

Alternate Options

None

fno-operator-names

Disables support for the operator names specified in the standard.

Syntax

Linux OS:

`-fno-operator-names`

macOS:

`-fno-operator-names`

Windows OS:

`None`

Arguments

None

Default

OFF

Description

Disables support for the operator names specified in the standard.

IDE Equivalent

None

Alternate Options

None

fno-rtti

Disables support for run-time type information (RTTI).

Syntax

Linux OS:

`-fno-rtti`

macOS:

`-fno-rtti`

Windows OS:

`None`

Arguments

None

Default

OFF	Support for run-time type information (RTTI) is enabled.

Description

This option disables support for run-time type information (RTTI).

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: None

OS X

Xcode: **Language > Enable C++ Runtime Types**

Alternate Options

None

fnon-lvalue-assign

Determines whether casts and conditional expressions can be used as lvalues.

Syntax

Linux OS and macOS:

`-fnon-lvalue-assign`

`-fno-non-lvalue-assign`

Windows OS:

`None`

Arguments

None

Default

`-fnon-lvalue-assign`	The compiler allows casts and conditional expressions to be used as `lvalues`.

Description

This option determines whether casts and conditional expressions can be used as `lvalues`.

IDE Equivalent

None

Alternate Options

None

fpermissive

Tells the compiler to allow for non-conformant code.

Syntax

Linux OS:

`-fpermissive`

macOS:

`-fpermissive`

Windows OS:

`None`

Arguments

None

Default

OFF

Description

Tells the compiler to allow for non-conformant code.

IDE Equivalent

None

Alternate Options

None

fshort-enums

Tells the compiler to allocate as many bytes as needed for enumerated types.

Syntax

Linux OS:

`-fshort-enums`

macOS:

`-fshort-enums`

Windows OS:

`None`

Arguments

None

Default

OFF	The compiler allocates a default number of bytes for enumerated types.

Description

This option tells the compiler to allocate as many bytes as needed for enumerated types.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Data > Associate as Many Bytes as Needed for Enumerated Types**

OS X

Xcode: **Data > Allocate enumerated types**

Alternate Options

None

fsyntax-only

Tells the compiler to check only for correct syntax.

Syntax

Linux OS:

`-fsyntax-only`

macOS:

`-fsyntax-only`

Windows OS:

`None`

Arguments

None

Default

OFF	Normal compilation is performed.

Description

This option tells the compiler to check only for correct syntax. No object file is produced.

IDE Equivalent

None

Alternate Options

Linux and macOS: None

Windows: `/Zs`

ftemplate-depth, Qtemplate-depth

Control the depth in which recursive templates are expanded.

Syntax

Linux OS:

`-ftemplate-depth=n`

macOS:

`-ftemplate-depth=n`

Windows OS:

`/Qtemplate-depth:n`

Arguments

n	The number of recursive templates that are expanded.

Default

OFF	The compiler uses default heuristics for the depth of expansion.

Description

Control the depth in which recursive templates are expanded. On Linux*, this option is supported only by invoking the compiler with `icpc`.

IDE Equivalent

None

Alternate Options

None

funsigned-bitfields

Determines whether the default bitfield type is changed to unsigned.

Syntax

Linux OS:

`-funsigned-bitfields`

`-fno-unsigned-bitfields`

macOS:

`-funsigned-bitfields`

`-fno-unsigned-bitfields`

Windows OS:

`None`

Arguments

None

Default

`-fno-unsigned-bitfields`	The default bitfield type is signed.

Description

This option determines whether the default bitfield type is changed to `unsigned`.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Data > Change Default Bitfield Type to unsigned**

OS X

Xcode: **Data > Unsigned bitfield Type**

Alternate Options

None

funsigned-char

Change default char type to unsigned.

Syntax

Linux OS:

`-funsigned-char`

macOS:

`-funsigned-char`

Windows OS:

`None`

Arguments

None

Default

OFF	Do not change default char type to unsigned.

Description

Change default char type to unsigned.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Data > Change default char type to unsigned**

OS X

Xcode: **Data > Unsigned char Type**

Alternate Options

None

GZ

Initializes all local variables. This is a deprecated option that may be removed in a future release.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/GZ`

Arguments

None

Default

OFF	The compiler does not initialize local variables.

Description

This option initializes all local variables to a non-zero value. To use this option, you must also specify option `/Od`.

This is a deprecated option that may be removed in a future release. The replacement option is `/RTC1`.

IDE Equivalent

None

Alternate Options

Linux and macOS: None

Windows: `/RTC1`

H (Windows*)

Causes the compiler to limit the length of external symbol names. This is a deprecated option. There is no replacement option.

Syntax

Linux OS and macOS:

`None`

Windows OS:

`/Hn`

Arguments

n	Is the maximum number of characters for external symbol names.

Default

OFF	The compiler follows default rules for the length of external symbol names.

Description

This option causes the compiler to limit the length of external symbol names to a maximum of *n* characters.

IDE Equivalent

None

Alternate Options

None

help-pragma, Qhelp-pragma

Displays all supported pragmas.

Syntax

Linux OS:

`-help-pragma`

macOS:

`-help-pragma`

Windows OS:

`/Qhelp-pragma`

Arguments

None

Default

OFF	No list is displayed unless this compiler option is specified.

Description

This option displays all supported pragmas and shows their syntaxes.

IDE Equivalent

None

Alternate Options

None

intel-extensions, Qintel-extensions

Enables or disables all Intel® C and Intel® C++ language extensions.

Syntax

Linux OS and macOS:

`-intel-extensions`

`-no-intel-extensions`

Windows OS:

`/Qintel-extensions`

`/Qintel-extensions-`

Arguments

None

Default

OFF	The Intel® C and Intel® C++ language extensions are enabled.

Description

This option enables or disables all Intel® C and Intel® C++ language extensions.

If you specify the negative form of the option (see above), it disables all Intel® C and Intel® C++ language extensions.

Note that certain settings for the `[Q]std` compiler option can enable or disable decimal floating-point support:

- The following `[Q]std` settings enable decimal floating-point support: c89, gnu89 (Linux* only), gnu99 (Linux* only)
- The following `[Q]std` setting disables decimal floating-point support: c99

IDE Equivalent

Visual Studio

Visual Studio: **Language > Disable All Intel Language Extensions**

Eclipse

Eclipse: **Language > Disable All Intel Language Extensions**

Xcode

Xcode: **Language > Enable Intel C/C++ language extensions**

Alternate Options

None

See Also

`std, Qstd` compiler option

J

Sets the default character type to unsigned.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/J`

Arguments

None

Default

OFF	The default character type is `signed`

Description

This option sets the default character type to `unsigned`. This option has no effect on character values that are explicitly declared `signed`. This option sets `_CHAR_UNSIGNED` = 1.

IDE Equivalent

Windows

Visual Studio: **Language > Default Char Unsigned**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

restrict, Qrestrict

Determines whether pointer disambiguation is enabled with the restrict qualifier.

Syntax

Linux OS:

`-restrict`

`-no-restrict`

macOS:

`-restrict`

`-no-restrict`

Windows OS:

`/Qrestrict`

`/Qrestrict-`

Arguments

None

Default

`-no-restrict` or `/Qrestrict-`	Pointers are not qualified with the restrict keyword.

Description

This option determines whether pointer disambiguation is enabled with the restrict qualifier. Option `-restrict` and `/Qrestrict` enable the recognition of the restrict keyword as defined by the ANSI standard.

By qualifying a pointer with the restrict keyword, you assert that an object accessed by the pointer is only accessed by that pointer in the given scope. You should use the restrict keyword only when this is true. When the assertion is true, the restrict option will have no effect on program correctness, but may allow better optimization.

IDE Equivalent

Windows

Visual Studio: **Language > Recognize The Restrict Keyword**

Linux

Eclipse: **Language > Recognize The Restrict Keyword**

OS X

Xcode: **Language > Recognize RESTRICT keyword**

Alternate Options

None

See Also

`std, Qstd` compiler option

std, Qstd

Tells the compiler to conform to a specific language standard.

Syntax

Linux OS:

`-std=`*`val`*

macOS:

`-std=`*`val`*

Windows OS:

`/Qstd:`*`val`*

`/std:`*`val`* `(For Microsoft* compatibility)`

Arguments

val Specifies the specific language standard to conform to.

The following values apply to Linux* `-std` and Windows* `/Qstd`:

`c++2b`	Enables support for the Working Draft for ISO C++ 2023 DIS standard.
`c++20`	Enables support for the 2020 ISO C++ DIS standard.
`c++17`	Enables support for the 2017 ISO C++ standard with amendments.
`c++14`	Enables support for the 2014 ISO C++ standard with amendments.
`c++11`	Enables support for the 2011 ISO C++ standard with amendments.
`c++98` and `c++03`	Enables support for the 1998 ISO C++ standard with amendments.
`c2x`	Enables support for the Working Draft for ISO C2x standard.
`c18` and `c17`	Enables support for the 2017 ISO C standard. Support for c17 can also be enabled by value iso9899:2017. Support for c18 can also be enabled by value iso9899:2018.
`c11`	Enables support for the 2011 ISO C standard. Support for this standard can also be enabled by value iso9899:2011.
`c99`	Enables support for the 1999 ISO C standard. Support for this standard can also be enabled by value iso9899:1999.

`c90` and `c89`	Enables support for the 1990 ISO C standard. Support for this standard can also be enabled by value iso9899:1990.

The following values apply only to Linux `-std`:

`gnu++2b`	Enables support for the Working Draft for ISO C++ 2023 DIS standard plus GNU extensions.
`gnu++20`	Enables support for the 2020 ISO C++ DIS standard plus GNU extensions.
`gnu++17`	Enables support for the 2017 ISO C++ standard with amendments plus GNU extensions.
`gnu++14`	Enables support for the 2014 ISO C++ standard with amendments plus GNU extensions.
`gnu++11`	Enables support for the 2011 ISO C++ standard with amendments plus GNU extensions.
`gnu++98` and `gnu++03`	Enables support for the 1998 ISO C++ standard with amendments plus GNU extensions.
`gnu2x`	Enables support for the Working Draft for ISO C2x standard plus GNU extensions.
`gnu18` and `gnu17`	Enables support for the 2017 ISO C standard plus GNU extensions.
`gnu11`	Enables support for the 2011 ISO C standard plus GNU extensions.
`gnu99`	Enables support for the 1999 ISO C standard plus GNU extensions.
`gnu90` and `gnu89`	Enables support for the 1990 ISO C standard plus GNU extensions.

For possible values for Microsoft*-compatible Windows* /std, see the Microsoft* documentation.

Default

Default for Windows option `/Qstd`: OFF	The compiler does not conform to a specific language standard.
Default for Windows option `/std`: `c++14`	Currently, the compiler conforms to the 2014 ISO C++ standard. For the latest information, see the Microsoft* documentation.
Default for Linux option `-std` on icc (Classic C compiler): `c99` or `c11`	If using GCC5.x or higher, the compiler conforms to c99, which is the 1999 ISO C standard. If using GCC5.0 or lower, the compiler conforms to c11, which is the 2011 ISO C standard.
Default for Linux option `-std` on icpc (Classic C++ compiler): varies	If using GCC5.x or lower, the compiler conforms to c++98, which is the 1998 ISO C++ standard. If using GCC6.0 to GCC11.0, the compiler conforms to c++14, which is the 2014 ISO C++ standard. If using GCC11.1 or higher, the compiler conforms to c++17, which is the 2017 ISO C++ standard.

Description

This option tells the compiler to conform to a specific language standard.

IDE Equivalent

Visual Studio

Visual Studio: **Language > C/C++ Language Support**

Eclipse

Eclipse: **Language > ANSI Conformance**

Xcode

Xcode: **Language > C Language Dialect and C++ Language Dialect**

Alternate Options

None

strict-ansi

Tells the compiler to implement strict ANSI conformance dialect.

Syntax

Linux OS:

`-strict-ansi`

macOS:

`-strict-ansi`

Windows OS:

`None`

Arguments

None

Default

OFF	The compiler conforms to default standards.

Description

This option tells the compiler to implement strict ANSI conformance dialect. On Linux* systems, if you need to be compatible with gcc, use the `-ansi` option.

This option sets option `fmath-errno`, which tells the compiler to assume that the program tests errno after calls to math library functions. This restricts optimization because it causes the compiler to treat most math functions as having side effects.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Language > ANSI Conformance**

OS X

Xcode: **Language > C Language Dialect and Language > C++ Language Dialect**

Alternate Options

None

vd

Enables or suppresses hidden vtordisp members in C++ objects.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/vdn`

Arguments

n	Possible values are:	
	`0`	Suppresses the creation of the hidden `vtordisp` members in C++ objects.
	`1`	Enables the creation of hidden `vtordisp` members in C++ objects when they are necessary.
	`2`	Enables the hidden `vtordisp` members for all virtual base classes with virtual functions. This setting is recommended in the following cases: • When the only virtual function in your virtual base class is a destructor • When you want to ensure correct performance of the dynamic_cast operator on a partially-constructed object

Default

`/vd1`	The compiler enables the creation of hidden `vtordisp` members in C++ objects when they are necessary.

Description

This option enables or suppresses hidden `vtordisp` members in C++ objects.

This is a compatibility option for the Microsoft Visual C++* option `/vdn`. For full details about this compiler option, see the Microsoft* documentation.

IDE Equivalent

None

Alternate Options

None

vmb

Selects the smallest representation that the compiler uses for pointers to members.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/vmb`

Arguments

None

Default

OFF	The compiler uses default rules to represent pointers to members.

Description

This option selects the smallest representation that the compiler uses for pointers to members. Use this option if you define each class before you declare a pointer to a member of the class.

IDE Equivalent

None

Alternate Options

None

vmg

Selects the general representation that the compiler uses for pointers to members.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/vmg`

Arguments

None

Default

OFF	The compiler uses default rules to represent pointers to members.

Description

This option selects the general representation that the compiler uses for pointers to members. Use this option if you declare a pointer to a member before you define the corresponding class.

IDE Equivalent

None

Alternate Options

None

vmm

Enables pointers to class members with single or multiple inheritance.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/vmm`

Arguments

None

Default

OFF	The compiler uses default rules to represent pointers to members.

Description

This option enables pointers to class members with single or multiple inheritance. To use this option, you must also specify option `/vmg`.

IDE Equivalent

None

Alternate Options

None

vms

Enables pointers to members of single-inheritance classes.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/vms`

Arguments

None

Default

OFF	The compiler uses default rules to represent pointers to members.

Description

This option enables pointers to members of single-inheritance classes. To use this option, you must also specify option `/vmg`.

IDE Equivalent

None

Alternate Options

None

x (type option)

All source files found subsequent to -x type will be recognized as a particular type.

Syntax

Linux OS:

`-x` *`type`*

macOS:

`-x` *`type`*

Windows OS:

`None`

Arguments

type	is the type of source file. Possible values are:

`c++`	C++ source file
`c++-header`	C++ header file
`c++-cpp-output`	C++ pre-processed file
`c`	C source file
`c-header`	C header file
`cpp-output`	C pre-processed file
`assembler`	Assembly file
`assembler-with-cpp`	Assembly file that needs to be preprocessed
`none`	Disable recognition, and revert to file extension

Default

`none`	Disable recognition and revert to file extension.

Description

All source files found subsequent to `-x`*type* will be recognized as a particular type.

IDE Equivalent

None

Alternate Options

None

Example

Suppose you want to compile the following C and C++ source files whose extensions are not recognized by the compiler:

File Name	Language
file1.c99	C
file2.cplusplus	C++

We will also include these files whose extensions are recognized:

File Name	Language
file3.c	C
file4.cpp	C++

The command-line invocation using the `-x` option follows:

```
icpc -x c file1.c99 -x c++ file2.cplusplus -x none file3.c file4.cpp
```

Za

Disables Microsoft Visual C++* compiler language extensions.*

Syntax

Linux OS and macOS:

`None`

Windows OS:

`/Za`

Arguments

None

Default

OFF	The compiler provides support for extended ANSI C.

Description

This option disables Microsoft* Visual C++* compiler language extensions.

IDE Equivalent

Windows

Visual Studio: **Language > Disable Language Extensions**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

See Also

`Ze` compiler option
`Zc` compiler option

Zc

Lets you specify ANSI C standard conformance for certain language features.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Zc:`*`arg1`*`[,`*`arg2`*`]`

Arguments

arg	Is the language feature for which you want standard conformance. The settings are compatible with Microsoft* settings for option /Zc. For a list of supported settings, see the table in the Description section of this topic.

Default

varies	See the table in the Description section of this topic.

Description

This option lets you specify ANSI C standard conformance for certain language features.

If you do not want the default behavior for one or more of the settings, you must specify the negative form of the setting. For example, if you do not want the `forScope` or `wchar_t` default behavior, you should specify `/Zc:forScope-,wchar_t-`.

The following table shows the supported Microsoft settings for option `/Zc`.

`/Zc` setting name	**Description**
auto[-]	Enforces compliance to the new standard meaning for auto (default). Disabled by /Zc:auto-.
forScope[-]	Enforces standard compliance in for-loop scope (default). Disabled by /Zc:forScope-.
inline[-]	Controls inline expansion. Disabled by /Zc:inline- (default).
rvalueCast[-]	Enforces Standard C++ explicit type conversion rules. Disabled by /Zc:rvalueCast- (default).
strictStrings[-]	Enforces const qualification for string literals. Disabled by /Zc:strictStrings- (default).
threadSafeInit[-]	Enables thread-safe initialization of local statics (default). Disabled by /Zc:threadSafeInit-.
throwingNew[-]	Enables link with the operator new implementation. Disabled by /Zc:throwingNew- (default).
trigraphs[-]	Enables trigraph character sequences. Disabled by /Zc:trigraphs- (default).
wchar_t[-]	Specifies that wchar_t is a native data type (default). Disabled by /Zc:wchar_t-.

IDE Equivalent

Windows

Visual Studio: **Language > Treat wchar_t as Built-in Type / Force Conformance In For Loop Scope**

Language > Enforce type conversion rules (rvalueCast)

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

Ze

Enables Microsoft Visual C++* compiler language extensions. This is a deprecated option that may be removed in a future release.*

Syntax

Linux OS and macOS:

`None`

Windows OS:

`/Ze`

Arguments

None

Default

ON	The compiler provides support for extended ANSI C.

Description

This option enables Microsoft* Visual C++* compiler language extensions.

This is a deprecated option that may be removed in a future release. There is no replacement option.

IDE Equivalent

None

Alternate Options

None

See Also

`Zc` compiler option
`Za` compiler option

Zg

Tells the compiler to generate function prototypes. This is a deprecated option that may be removed in a future release.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Zg`

Arguments

None

Default

OFF	The compiler does not create function prototypes.

Description

This option tells the compiler to generate function prototypes.

This is a deprecated option that may be removed in a future release. There is no replacement option.

IDE Equivalent

None

Alternate Options

None

Zp

Specifies alignment for structures on byte boundaries.

Syntax

Linux OS:

`-Zp[n]`

macOS:

`-Zp[n]`

Windows OS:

`/Zp[n]`

Arguments

n	Is the byte size boundary. Possible values are 1, 2, 4, 8, or 16.

Default

`Zp16`	Structures are aligned on either size boundary 16 or the boundary that will naturally align them.

Description

This option specifies alignment for structures on byte boundaries.

If you do not specify *n*, you get `Zp16`.

IDE Equivalent

Windows

Visual Studio: **Code Generation > Struct Member Alignment**

Linux

Eclipse: **Data > Structure Member Alignment**

OS X

Xcode: **Data > Structure Member Alignment**

Alternate Options

None

Zs

Tells the compiler to check only for correct syntax.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Zs`

Arguments

None

Default

OFF	Normal compilation is performed.

Description

This option tells the compiler to check only for correct syntax.

IDE Equivalent

None

Alternate Options

Linux: `-syntax`, `-fsyntax-only`

Windows: None

Data Options

This section contains descriptions for compiler options that pertain to the treatment of data.

align

Determines whether variables and arrays are naturally aligned.

Architecture Restrictions

Only available on IA-32 architecture

Syntax

Linux OS:

`-align`

`-noalign`

macOS:

`-align`

`-noalign`

Windows OS:

`None`

Arguments

None

Default

`-noalign`	Variables and arrays are aligned according to the gcc model, which means they are aligned to 4-byte boundaries.

Description

This option determines whether variables and arrays are naturally aligned. Option `-align` forces the following natural alignment:

Type	Alignment
`double`	8 bytes
`long long`	8 bytes
`long double`	16 bytes

If you are not interacting with system libraries or other libraries that are compiled without `-align`, this option can improve performance by reducing misaligned accesses.

This option can also be specified as `-m[no-]align-double`. The options are equivalent.

Caution
If you are interacting with compatible libraries, this option can improve performance by reducing misaligned accesses. However, if you are interacting with noncompatible libraries or libraries that are compiled without option `-align`, your application may not perform as expected.

IDE Equivalent

None

Alternate Options

None

auto-ilp32, Qauto-ilp32

Instructs the compiler to analyze the program to determine if there are 64-bit pointers that can be safely shrunk into 32-bit pointers and if there are 64-bit longs (on Linux systems) that can be safely shrunk into 32-bit longs.*

Architecture Restrictions

Only available on Intel® 64 architecture

Syntax

Linux OS and macOS:

`-auto-ilp32`

Windows OS:

`/Qauto-ilp32`

Arguments

None

Default

OFF	The optimization is not attempted.

Description

This option instructs the compiler to analyze the program to determine if there are 64-bit pointers that can be safely shrunk into 32-bit pointers and if there are 64-bit longs (on Linux* systems) that can be safely shrunk into 32-bit longs.

On macOS systems, you must also specify option `-no-pie` for the optimization to occur.

For this option to be effective, the compiler must be able to optimize using the `[Q]ipo` option and must be able to analyze all library calls or external calls the program makes. This option has no effect on Linux* systems unless you specify setting SSE3 or higher for option `-x`.

This option requires that the size of the program executable never exceeds 2^{32} bytes and all data values can be represented within 32 bits. If the program can run correctly in a 32-bit system, these requirements are implicitly satisfied. If the program violates these size restrictions, unpredictable behavior may occur.

IDE Equivalent

None

Alternate Options

None

x, Qx
compiler option

auto-p32

Instructs the compiler to analyze the program to determine if there are 64-bit pointers that can be safely shrunk to 32-bit pointers.

Architecture Restrictions

Only available on Intel® 64 architecture

Syntax

Linux OS and macOS:

`-auto-p32`

Windows OS:

None

Arguments

None

Default

OFF	The optimization is not performed.

Description

This option instructs the compiler to analyze and transform the program so that 64-bit pointers are shrunk to 32-bit pointers, wherever it is legal and safe to do so.

On macOS systems, you must also specify option `-no-pie` for the optimization to occur.

For this option to be effective, the compiler must be able to optimize using the `-ipo` option and it must be able to analyze all library calls or external calls the program makes. This option has no effect unless you specify setting SSE3 or higher for option `-x`.

The application cannot exceed a 32-bit address space; otherwise, unpredictable results can occur.

 compiler option

check-pointers, Qcheck-pointers

Determines whether the compiler checks bounds for memory access through pointers.

Syntax

Linux OS:

`-check-pointers=`*keyword*

macOS:

None

Windows OS:

`/Qcheck-pointers:`*keyword*

Arguments

keyword	Specifies what type of bounds checking occurs. Possible values are:	
	`none`	Disables bounds checking. This is the default.
	`rw`	Checks bounds for reads and writes through pointers.
	`write`	Checks bounds for only writes through pointers.

Default

`-check-pointers=none` or `/Qcheck-pointers:none`	No bounds checking occurs for memory access through pointers.

Description

This option determines whether the compiler checks bounds for memory access through pointers. It enables checking of all indirect accesses through pointers, and all array accesses.

The compiler may optimize these checks away when it can determine that an access is safe.

When `rw` or `write` is specified, the `[Q]check-pointers-undimensioned` option is set and dimensioned and undimensioned arrays are checked.

If you do not want undimensioned arrays checked, you must specify option the negative form of the option (see Syntax above).

This pointer checker feature requires installation of another product. For more information, see Feature Requirements.

IDE Equivalent

Windows

Visual Studio: **Code Generation > Check Pointers**

Linux

Eclipse: **Code Generation > Check Pointers**

OS X

Xcode: None

Alternate Options

None

See Also

check-pointers-undimensioned, Qcheck-pointers-undimensioned
compiler option

check-pointers-dangling, Qcheck-pointers-dangling
compiler option

check-pointers-dangling, Qcheck-pointers-dangling

Determines whether the compiler checks for dangling pointer references.

Syntax

Linux OS:

`-check-pointers-dangling=`*`keyword`*

macOS:

`None`

Windows OS:

`/Qcheck-pointers-dangling:`*`keyword`*

Arguments

keyword	Specifies what type of dangling pointer checking occurs. Possible values are:	
	`none`	Disables checking for dangling pointer references. This is the default.
	`heap`	Checks for dangling pointer references on the heap.
	`stack`	Checks for dangling pointer references on the stack.
	`all`	Checks for dangling pointer references on the heap and the stack.

Default

`-check-pointers-dangling=none` or `/Qcheck-pointers-dangling:none`	No checking occurs for dangling pointer references.

Description

This option determines whether the compiler checks for dangling pointer references.

To use this option, you must also specify the `[Q]check-pointers` option.

This pointer checker feature requires installation of another product. For more information, see Feature Requirements.

IDE Equivalent

Windows

Visual Studio: **Code Generation > Check Dangling Pointers**

Linux

Eclipse: **Code Generation > Check Dangling Pointers**

OS X

Xcode: None

Alternate Options

None

See Also

check-pointers, Qcheck-pointers
compiler option

check-pointers-mpx, Qcheck-pointers-mpx

Determines whether the compiler checks bounds for memory access through pointers on processors that support Intel® Memory Protection Extensions (Intel® MPX).

Syntax

Linux OS:

`-check-pointers-mpx=`*`keyword`*

macOS:

`None`

Windows OS:

`/Qcheck-pointers-mpx:`*`keyword`*

Arguments

keyword	Specifies what type of bounds checking occurs. Possible values are:

`none`	Disables bounds checking. This is the default.
`rw`	Checks bounds for reads and writes through pointers.
`write`	Checks bounds for only writes through pointers.

Default

`-check-pointers-mpx=none` or `/Qcheck-pointers-mpx:none`	No bounds checking occurs for memory access through pointers on processors that support Intel® MPX.

Description

This option determines whether the compiler checks bounds for memory access through pointers on processors that support Intel® MPX. It enables checking of all indirect accesses through pointers, and all array accesses.

The compiler may optimize these checks away when it can determine that an access is safe.

If you specify option `[Q]check-pointers` along with option `[Q]check-pointers-mpx`, option `[Q]check-pointers-mpx` takes precedence.

If you specify `[Q]check-pointers-mpx`, you cannot specify option `[Q]check-pointers-dangling`.

NOTE
This feature requires supporting hardware, OS, and library support. Intel® MPX bounds exceptions are hardware exceptions that are handled by the OS and run-time library, similar to the way that a null pointer exception is handled. Pointer Checker detailed reports and report control functions are not enabled with Intel® MPX, because these require overriding the OS exception handling.

For more details, see the document titled: Intel® Memory Protection Extensions Enabling Guide.

This pointer checker feature requires installation of another product. For more information, see Feature Requirements.

IDE Equivalent

Visual Studio

Visual Studio: **Code Generation > Check Pointers**

Eclipse

Eclipse: **Code Generation > Check Pointers**

Xcode

Xcode: None

Alternate Options

None

See Also

check-pointers, Qcheck-pointers

compiler option

check-pointers-undimensioned, Qcheck-pointers-undimensioned
compiler option

check-pointers-narrowing, Qcheck-pointers-narrowing

Determines whether the compiler enables or disables the narrowing of pointers to structure fields.

Syntax

Linux OS:

`-check-pointers-narrowing`

`-no-check-pointers-narrowing`

macOS:

None

Windows OS:

`/Qcheck-pointers-narrowing`

`/Qcheck-pointers-narrowing-`

Arguments

None

Default

`-check-pointers-narrowing` or `/Qcheck-pointers-narrowing`	The compiler enables the narrowing of pointers to structure fields.

Description

This option determines whether the compiler enables or disables the narrowing of pointers to structure fields. Narrowing restricts a field pointer so that it can only legally point to that field.

To use this option, you must also specify the `[Q]check-pointers` option.

Disabling this feature can improve Pointer Checker compatibility with non-ANSI compliant code.

To disable the narrowing of pointers to structure fields, specify the negative form of the option (see Syntax above).

This pointer checker feature requires installation of another product. For more information, see Feature Requirements.

IDE Equivalent

None

Alternate Options

None

See Also

check-pointers, Qcheck-pointers
compiler option

check-pointers-undimensioned, Qcheck-pointers-undimensioned

Determines whether the compiler checks bounds for memory access through arrays that are declared without dimensions.

Syntax

Linux OS:

`-check-pointers-undimensioned`

`-no-check-pointers-undimensioned`

macOS:

`None`

Windows OS:

`/Qcheck-pointers-undimensioned`

`/Qcheck-pointers-undimensioned-`

Arguments

None

Default

`-check-pointers-undimensioned` or `/Qcheck-pointers-undimensioned`	Bounds checking occurs for memory access through arrays that are declared without dimensions. This checking occurs for both dimensioned and undimensioned arrays.

Description

This option determines whether the compiler checks bounds for memory access through arrays that are declared without dimensions.

To use this option, you must also specify the `[Q]check-pointers` option.

This pointer checker feature requires installation of another product. For more information, see Feature Requirements.

The default setting, `[Q]check-pointers-undimensioned`, can cause link time errors for multiple definitions for non-standard code and it can cause linker warnings for undefined symbols when linking library code that has not been compiled with pointer checking enabled. In both of these cases, the symbols will contain the string cp_array_end.

To prevent these issues, disable the checking of undimensioned arrays, by specifying the negative form of the option (see Syntax above).

Note that even if you specify the negative form of the option, dimensioned arrays are always checked.

IDE Equivalent

Windows

Visual Studio: **Code Generation > Turn off Checking for Undimensioned Arrays**

Linux

Eclipse: **Code Generation > Turn off Checking for Undimensioned Arrays**

OS X

Xcode: None

Alternate Options

None

check-pointers, Qcheck-pointers
compiler option

falign-functions, Qfnalign

Tells the compiler to align functions on an optimal byte boundary.

Syntax

Linux OS:

`-falign-functions[=n]`

`-fno-align-functions`

macOS:

`-falign-functions[=n]`

`-fno-align-functions`

Windows OS:

`/Qfnalign[:n]`

`/Qfnalign-`

Arguments

n	Is an optional positive integer initialization expression indicating the number of bytes for the minimum alignment boundary. It tells the compiler to align functions on a power-of-2 byte boundary. If you do not specify *n*, the compiler aligns the start of functions on 16-byte boundaries. The *n* must be a positive integer less than or equal to 4096. If you specify a value that is not a power of 2, *n* will be rounded up to the nearest power of 2. For example, if 23 is specified for *n*, functions will be aligned on 32 byte boundaries.

Default

`-fno-align-functions` or `/Qfnalign-`	The compiler aligns functions on 2-byte boundaries. This is the same as specifying `-falign-functions=2` (Linux* and macOS) or `/Qfnalign:2` (Windows*).

Description

This option tells the compiler to align functions on an optimal byte boundary. If you do not specify *n*, the compiler aligns the start of functions on 16-byte boundaries.

IDE Equivalent

None

Alternate Options

None

falign-loops, Qalign-loops

Aligns loops to a power-of-two byte boundary.

Syntax

Linux OS:

`-falign-loops[=n]`

`-fno-align-loops`

macOS:

`-falign-loops[=n]`

`-fno-align-loops`

Windows OS:

`/Qalign-loops[:n]`

`/Qalign-loops-`

Arguments

n	Is the optional number of bytes for the minimum alignment boundary. It must be a power of 2 between 1 and 4096, such as 1, 2, 4, 8, 16, 32, 64, 128, and so on. If you specify 1 for *n*, no alignment is performed; this is the same as specifying the negative form of the option. If you do not specify *n*, the default alignment is 16 bytes.

Default

`-fno-align-loops` or `/Qalign-loops-`	No special loop alignment is performed.

Description

This option aligns loops to a power-of-two boundary. This alignment may improve performance.

It can be affected by the pragma code_align and attribute code_align.

If code is compiled with the `-falign-loops=m` (Linux* and macOS) or `/Qalign-loops:m` (Windows*) option and a code_align:n pragma precedes a loop, the loop is aligned on a max (m, n) byte boundary. If a function is modified by a code_align:k pragma and a code_align:n pragma precedes a loop, then both the function and the loop are aligned on a max (k, n) byte boundary.

IDE Equivalent

None

Alternate Options

None

See Also

falign-functions, Qfnalign compiler option

falign-stack

Tells the compiler the stack alignment to use on entry to routines. This is a deprecated option that may be removed in a future release.

Architecture Restrictions

Only available on IA-32 architecture. IA-32 support is deprecated and will be removed in a future release.

Syntax

Linux OS:

`-falign-stack=`*`mode`*

macOS:

None

Windows OS:

None

Arguments

mode	Is the method to use for stack alignment. Possible values are:	
	`assume-4-byte`	Tells the compiler to assume the stack is aligned on 4-byte boundaries. The compiler can dynamically adjust the stack to 16-byte alignment if needed.
	`maintain-16-byte`	Tells the compiler to not assume any specific stack alignment, but attempt to maintain alignment in case the stack is already aligned. The compiler can dynamically align the stack if needed. This setting is compatible with gcc.
	`assume-16-byte`	Tells the compiler to assume the stack is aligned on 16-byte boundaries and to continue to maintain 16-byte alignment. This setting is compatible with gcc.

Default

`-falign-stack=assume-16-byte`	The compiler assumes the stack is aligned on 16-byte boundaries and continues to maintain 16-byte alignment.

Description

This option tells the compiler the stack alignment to use on entry to routines.

This is a deprecated option that may be removed in a future release. There is no replacement option.

IDE Equivalent

None

Alternate Options

None

fcommon

Determines whether the compiler treats common symbols as global definitions.

Syntax

Linux OS:

`-fcommon`

`-fno-common`

macOS:

`-fcommon`

`-fno-common`

Windows OS:

None

Arguments

None

Default

`-fcommon` The compiler does not treat common symbols as global definitions.

Description

This option determines whether the compiler treats common symbols as global definitions and to allocate memory for each symbol at compile time.

Option `-fno-common` tells the compiler to treat common symbols as global definitions. When using this option, you can only have a common variable declared in one module; otherwise, a link time error will occur for multiple defined symbols.

Normally, a file-scope declaration with no initializer and without the `extern` or `static` keyword "int i;" is represented as a common symbol. Such a symbol is treated as an external reference. However, if no other compilation unit has a global definition for the name, the linker allocates memory for it.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Data > Allow gprel Addressing of Common Data Variables**

OS X

Xcode: **Data > Allow gprel Addressing of Common Data Variables**

Alternate Options

None

fextend-arguments, Qextend-arguments

Controls how scalar integer arguments are extended in calls to unprototyped and varargs functions.

Syntax

Linux OS and macOS:

`-fextend-arguments=`*n*

Windows OS:

`/Qextend-arguments:`*n*

Arguments

n	Specifies the extension for the integer parameters. Possible values are:	
	`32`	Causes unprototyped integer parameters to be extended to 32 bits.
	`64`	Causes unprototyped integer parameters to be extended to 64 bits. This value is only available on Intel® 64 architecture.

Default

`-fextend-arguments=32` or `/Qextend-arguments:32`	Unprototyped integer parameters are extended to 32 bits.

Description

This option controls how scalar integer arguments are extended in calls to unprototyped and varargs functions.

IDE Equivalent

None

Alternate Options

None

fkeep-static-consts, Qkeep-static-consts

Tells the compiler to preserve allocation of variables that are not referenced in the source.

Syntax

Linux OS:

`-fkeep-static-consts`

`-fno-keep-static-consts`

macOS:

`-fkeep-static-consts`

`-fno-keep-static-consts`

Windows OS:

`/Qkeep-static-consts`

`/Qkeep-static-consts-`

Arguments

None

Default

`-fno-keep-static-consts` or `/Qkeep-static-consts-`	If a variable is never referenced in a routine, the variable is discarded unless optimizations are disabled by option `-O0` (Linux* and macOS) or `/Od` (Windows*).

Description

This option tells the compiler to preserve allocation of variables that are not referenced in the source.

The negated form can be useful when optimizations are enabled to reduce the memory usage of static data.

IDE Equivalent

None

Alternate Options

None

fmath-errno

Tells the compiler that errno can be reliably tested after calls to standard math library functions.

Syntax

Linux OS:

`-fmath-errno`

`-fno-math-errno`

macOS:

`-fmath-errno`

`-fno-math-errno`

Windows OS:

`None`

Arguments

None

Default

`-fno-math-errno`	The compiler assumes that the program does not test `errno` after calls to standard math library functions.

Description

This option tells the compiler to assume that the program tests `errno` after calls to math library functions. This restricts optimization because it causes the compiler to treat most math functions as having side effects.

Option `-fno-math-errno` tells the compiler to assume that the program does not test `errno` after calls to math library functions. This frequently allows the compiler to generate faster code. Floating-point code that relies on IEEE exceptions instead of `errno` to detect errors can safely use this option to improve performance.

IDE Equivalent

None

Alternate Options

None

fminshared

Specifies that a compilation unit is a component of a main program and should not be linked as part of a shareable object.

Syntax

Linux OS:

`-fminshared`

macOS:

`-fminshared`

Windows OS:

None

Arguments

None

Default

OFF	Source files are compiled together to form a single object file.

Description

This option specifies that a compilation unit is a component of a main program and should not be linked as part of a shareable object.

This option allows the compiler to optimize references to defined symbols without special visibility settings. To ensure that external and common symbol references are optimized, you need to specify visibility hidden or protected by using the `-fvisibility`, `-fvisibility-hidden`, or `-fvisibility-protected` option.

Also, the compiler does not need to generate position-independent code for the main program. It can use absolute addressing, which may reduce the size of the global offset table (GOT) and may reduce memory traffic.

IDE Equivalent

None

Alternate Options

None

See Also

`fvisibility` compiler option

fmudflap

Tells the compiler to instrument risky pointer operations to prevent buffer overflows and invalid heap use. This is a deprecated option that may be removed in a future release.

Syntax

Linux OS:

`-fmudflap`

macOS:

`None`

Windows OS:

`None`

Arguments

None

Default

OFF	The compiler does not instrument risky pointer operations.

Description

Tells the compiler to instrument risky pointer operations to prevent buffer overflows and invalid heap use. It requires gcc 4.0 or newer.

This is a deprecated option that may be removed in a future release. There is no replacement option. You can consider using the Pointer Checker options (such as option `check-pointers`).

When using option `fmudflap`, you must specify linker option `-lmudflap` in the link command line to resolve references to the `libmudflap` library.

IDE Equivalent

None

Alternate Options

None

fpack-struct

Specifies that structure members should be packed together.

Syntax

Linux OS:

`-fpack-struct`

macOS:

`-fpack-struct`

Windows OS:

None

Arguments

None

Default

OFF

Description

Specifies that structure members should be packed together.

> **NOTE**
> Using this option may result in code that is not usable with standard (system) c and C++ libraries.

IDE Equivalent

None

Alternate Options

Linux and macOS: `-Zp1`

Windows: None

fpascal-strings

Tells the compiler to allow for Pascal-style string literals.

Architecture Restrictions

Only available on IA-32 architecture

Syntax

Linux OS:

`-fpascal-strings`

macOS:

`None`

Windows OS:

`None`

Arguments

None

Default

OFF	The compiler does not allow for Pascal-style string literals.

Description

Tells the compiler to allow for Pascal-style string literals.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: None

OS X

Xcode: **Data > Recognize Pascal Strings**

Alternate Options

None

fpic

Determines whether the compiler generates position-independent code.

Syntax

Linux OS:

`-fpic`

`-fno-pic`

macOS:

`-fpic`

`-fno-pic`

Windows OS:

`None`

Arguments

None

Default

`-fno-pic`	The compiler does not generate position-independent code.

Description

This option determines whether the compiler generates position-independent code.

Option `-fpic` specifies full symbol preemption. Global symbol definitions as well as global symbol references get default (that is, preemptable) visibility unless explicitly specified otherwise.

Option `-fpic` must be used when building shared objects.

This option can also be specified as `-fPIC`.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Code Generation > Generate Position Independent Code**

OS X

Xcode: None

Alternate Options

None

fpie

Tells the compiler to generate position-independent code. The generated code can only be linked into executables.

Syntax

Linux OS:

`-fpie`

macOS:

`None`

Windows OS:

`None`

Arguments

None

Default

OFF	The compiler does not generate position-independent code for an executable-only object.

Description

This option tells the compiler to generate position-independent code. It is similar to `-fpic`, but code generated by `-fpie` can only be linked into an executable.

Because the object is linked into an executable, this option causes better optimization of some symbol references.

To ensure that run-time libraries are set up properly for the executable, you should also specify option `-pie` to the compiler driver on the link command line.

Option `-fpie` can also be specified as `-fPIE`.

IDE Equivalent

None

Alternate Options

None

See Also

fpic compiler option
pie compiler option

freg-struct-return

Tells the compiler to return struct and union values in registers when possible.

Architecture Restrictions

Only available on IA-32 architecture

Syntax

Linux OS:

`-freg-struct-return`

macOS:

`None`

Windows OS:

`None`

Arguments

None

Default

OFF

Description

This option tells the compiler to return `struct` and `union` values in registers when possible.

IDE Equivalent

None

Alternate Options

None

fstack-protector

Enables or disables stack overflow security checks for certain (or all) routines.

Syntax

Linux OS:

`-fstack-protector[-`*`keyword`*`]`

`-fno-stack-protector[-`*`keyword`*`]`

macOS:

`-fstack-protector[-`*`keyword`*`]`

`-fno-stack-protector[-`*`keyword`*`]`

Windows OS:

None

Arguments

keyword	Possible values are:	
	`strong`	When option `-fstack-protector-strong` is specified, it enables stack overflow security checks for routines with any type of buffer.
	`all`	When option `-fstack-protector-all` is specified, it enables stack overflow security checks for every routine.

If no `-keyword` is specified, option `-fstack-protector` enables stack overflow security checks for routines with a string buffer.

Default

`-fno-stack-protector`, `-fno-stack-protector-strong`	No stack overflow security checks are enabled for the relevant routines.
`-fno-stack-protector-all`	No stack overflow security checks are enabled for any routines.

Description

This option enables or disables stack overflow security checks for certain (or all) routines. A stack overflow occurs when a program stores more data in a variable on the execution stack than is allocated to the variable. Writing past the end of a string buffer or using an index for an array that is larger than the array bound could cause a stack overflow and security violations.

The `-fstack-protector` options are provided for compatibility with gcc. They use the gcc/glibc implementation when possible. If the gcc/glibc implementation is not available, they use the Intel implementation.

For an Intel-specific version of this feature, see option `-fstack-security-check`.

IDE Equivalent

None

Alternate Options

None

See Also

`fstack-security-check` compiler option
`GS` compiler option

fstack-security-check

Determines whether the compiler generates code that detects some buffer overruns.

Syntax

Linux OS:

`-fstack-security-check`

`-fno-stack-security-check`

macOS:

`-fstack-security-check`

`-fno-stack-security-check`

Windows OS:

None

Arguments

None

Default

`-fno-stack-security-check`	The compiler does not detect buffer overruns.

Description

This option determines whether the compiler generates code that detects some buffer overruns that overwrite the return address. This is a common technique for exploiting code that does not enforce buffer size restrictions.

This option always uses an Intel implementation.

For a gcc-compliant version of this feature, see option `fstack-protector`.

IDE Equivalent

None

Alternate Options

Linux and macOS: None

Windows: `/GS`

See Also

`fstack-protector` compiler option
`GS` compiler option

fvisibility

Specifies the default visibility for global symbols or the visibility for symbols in a file.

Syntax

Linux OS:

`-fvisibility=`*keyword*

`-fvisibility-`*keyword*`=`*filename*

macOS:

`-fvisibility=`*keyword*

`-fvisibility-`*keyword*`=`*filename*

Windows OS:

None

Arguments

keyword	Specifies the visibility setting. Possible values are:	
	`default`	Sets visibility to default.
	`extern`	Sets visibility to extern.
	`hidden`	Sets visibility to hidden.
	`internal`	Sets visibility to internal.
	`protected`	Sets visibility to protected. This value is not available on macOS systems.
filename	Is the pathname of a file containing the list of symbols whose visibility you want to set. The symbols must be separated by whitespace (spaces, tabs, or newlines).	

Default

-fvisibility=default	The compiler sets visibility of symbols to default.

Description

This option specifies the default visibility for global symbols (syntax `-fvisibility=`*keyword*) or the visibility for symbols in a file (syntax `-fvisibility-`*keyword*`=`*filename*).

Visibility specified by `-fvisibility-`*keyword*`=`*filename* overrides visibility specified by `-fvisibility=`*keyword* for symbols specified in a file.

Option	Description
`-fvisibility=default` `-fvisibility-default=`*filename*	Sets visibility of symbols to default. This means other components can reference the symbol, and the symbol definition can be overridden (preempted) by a definition of the same name in another component.

Option	Description
`-fvisibility=extern` `-fvisibility-extern=`*filename*	Sets visibility of symbols to extern. This means the symbol is treated as though it is defined in another component. It also means that the symbol can be overridden by a definition of the same name in another component.
`-fvisibility=hidden` `-fvisibility-hidden=`*filename*	Sets visibility of symbols to hidden. This means that other components cannot directly reference the symbol. However, its address may be passed to other components indirectly.
`-fvisibility=internal` `-fvisibility-internal=`*filename*	Sets visibility of symbols to internal. This means that the symbol cannot be referenced outside its defining component, either directly or indirectly. The affected functions can never be called from another module, including through function pointers.
`-fvisibility=protected` `-fvisibility-protected=`*filename*	Sets visibility of symbols to protected. This means other components can reference the symbol, but it cannot be overridden by a definition of the same name in another component. This value is not available on macOS systems.

If an `-fvisibility` option is specified more than once on the command line, the last specification takes precedence over any others.

If a symbol appears in more than one visibility *filename*, the setting with the least visibility takes precedence.

The following shows the precedence of the visibility settings (from greatest to least visibility):

- `extern`
- `default`
- `protected`
- `hidden`
- `internal`

Note that `extern` visibility only applies to functions. If a variable symbol is specified as `extern`, it is assumed to be `default`.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Data > Default Symbol Visibility**

OS X

Xcode: **Data > Default Symbol Visibility**

Alternate Options

None

Example

A file named `prot.txt` contains symbols a, b, c, d, and e. Consider the following:

```
-fvisibility-protected=prot.txt
```

This option sets `protected` visibility for all the symbols in the file. It has the same effect as specifying `fvisibility=protected` in the declaration for each of the symbols.

fvisibility-inlines-hidden

Causes inline member functions (those defined in the class declaration) to be marked hidden.

Architecture Restrictions

Only available on IA-32 architecture

Syntax

Linux OS:

`-fvisibility-inlines-hidden`

macOS:

None

Windows OS:

None

Arguments

None

Default

OFF	The compiler does not cause inline member functions to be marked hidden.

Description

Causes inline member functions (those defined in the class declaration) to be marked hidden. This option is particularly useful for templates.

IDE Equivalent

None

Alternate Options

None

fzero-initialized-in-bss, Qzero-initialized-in-bss

Determines whether the compiler places in the DATA section any variables explicitly initialized with zeros.

Syntax

Linux OS:

`-fzero-initialized-in-bss`

`-fno-zero-initialized-in-bss`

macOS:

`-fzero-initialized-in-bss`

`-fno-zero-initialized-in-bss`

Windows OS:

`/Qzero-initialized-in-bss`

`/Qzero-initialized-in-bss-`

Arguments

None

Default

`-fno-zero-initialized-in-bss` or `/Qzero-initialized-in-bss-`	Variables explicitly initialized with zeros are placed in the BSS section. This can save space in the resulting code.

Description

This option determines whether the compiler places in the DATA section any variables explicitly initialized with zeros.

If option `-fno-zero-initialized-in-bss` (Linux* and macOS) or `/Qzero-initialized-in-bss-` (Windows*) is specified, the compiler places in the DATA section any variables that are initialized to zero.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Data > Disable Placement of Zero-Initialized Variables in .bss - place in .data instead**

OS X

Xcode: **Data > Place Zero-Initialized Variables in .bss**

Alternate Options

None

GA

Enables faster access to certain thread-local storage (TLS) variables.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/GA`

Arguments

None

Default

OFF	Default access to TLS variables is in effect.

Description

This option enables faster access to certain thread-local storage (TLS) variables. When you compile your main executable (`.EXE`) program with this option, it allows faster access to TLS variables declared with the `__declspec(thread)` specification.

Note that if you use this option to compile `.DLL`s, you may get program errors.

IDE Equivalent

Windows

Visual Studio: **Optimization > Optimize for Windows Applications**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

Gs

Lets you control the threshold at which the stack checking routine is called or not called.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Gs[`*n*`]`

Arguments

n	Is the number of bytes that local variables and compiler temporaries can occupy before stack checking is activated. This is called the *threshold*.

Default

`/Gs`	Stack checking occurs for routines that require more than 4KB (4096 bytes) of stack space. This is also the default if you do not specify *n*.

Description

This option lets you control the threshold at which the stack checking routine is called or not called. If a routine's local stack allocation exceeds the threshold (*n*), the compiler inserts a __chkstk() call into the prologue of the routine.

IDE Equivalent

None

Alternate Options

None

GS

Determines whether the compiler generates code that detects some buffer overruns.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/GS[:`*`keyword`*`]`

`/GS-`

Arguments

`keyword` Specifies the level of stack protection heuristics used by the compiler. Possible values are:

`off`	Tells the compiler to ignore buffer overruns. This is the same as specifying `/GS-`.
`partial`	Tells the compiler to provide a stack protection level that is compatible with Microsoft* Visual Studio 2008.
`strong`	Tells the compiler to provide full stack security level checking. This setting is compatible with more recent Microsoft* Visual Studio stack protection heuristics. This is the same as specifying `/GS` with no keyword.

Default

`/GS-`	The compiler does not detect buffer overruns.

Description

This option determines whether the compiler generates code that detects some buffer overruns that overwrite a function's return address, exception handler address, or certain types of parameters.

This option has been added for Microsoft compatibility.

Following Visual Studio 2008, the Microsoft implementation of option `/GS` became more extensive (for example, more routines are protected). The performance of some programs may be impacted by the newer heuristics. In such cases, you may see better performance if you specify `/GS:partial`.

For more details about option `/GS`, see the Microsoft documentation.

IDE Equivalent

Visual Studio

Visual Studio: **Code Generation > Security Check**

Eclipse

Eclipse: None

Xcode

Xcode: None

Alternate Options

Linux and macOS: `-fstack-security-check`

Windows: None

GT

Enables fiber-safe thread-local storage of data.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/GT`

Arguments

None

Default

OFF	There is no fiber-safe thread-local storage.

Description

This option enables fiber-safe thread-local storage (TLS) of data.

IDE Equivalent

Windows

Visual Studio: **Optimization > Enable Fiber-safe Optimizations**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

homeparams

Tells the compiler to store parameters passed in registers to the stack.

Architecture Restrictions

Only available on Intel® 64 architecture

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/homeparams`

Arguments

None

Default

OFF	Register parameters are not written to the stack.

Description

This option tells the compiler to store parameters passed in registers to the stack.

IDE Equivalent

None

Alternate Options

None

malign-double

Determines whether double, long double, and long long types are naturally aligned. This option is equivalent to specifying option align.

Architecture Restrictions

Only available on IA-32 architecture

Syntax

Linux OS:

`-malign-double`

`-mno-align-double`

macOS:

None

Windows OS:

None

Arguments

None

Default

`-mno-align-double`	Types are aligned according to the gcc model, which means they are aligned to 4-byte boundaries.

Description

For details, see the align option.

IDE Equivalent

None

Alternate Options

None

malign-mac68k

Aligns structure fields on 2-byte boundaries (m68k compatible).

Syntax

Linux OS:

None

macOS:

`-malign-mac68k`

Windows OS:

`None`

Arguments

None

Default

OFF	The compiler does not align structure fields on 2-byte boundaries.

Description

This option aligns structure fields on 2-byte boundaries (m68k compatible).

IDE Equivalent

None

Alternate Options

None

malign-natural

Aligns larger types on natural size-based boundaries (overrides ABI).

Syntax

Linux OS:

`None`

macOS:

`-malign-natural`

Windows OS:

`None`

Arguments

None

Default

OFF	The compiler does not align larger types on natural size-based boundaries.

Description

This option aligns larger types on natural size-based boundaries (overrides ABI).

IDE Equivalent

None

Alternate Options

None

malign-power

Aligns based on ABI-specified alignment rules.

Syntax

Linux OS:

`None`

macOS:

`-malign-power`

Windows OS:

`None`

Arguments

None

Default

ON	The compiler aligns based on ABI-specified alignment rules.

Description

Aligns based on ABI-specified alignment rules.

IDE Equivalent

None

Alternate Options

None

mcmodel

Tells the compiler to use a specific memory model to generate code and store data.

Architecture Restrictions

Only available on Intel® 64 architecture

Syntax

Linux OS:

`-mcmodel=`*`mem_model`*

macOS:

`None`

Windows OS:

`None`

Arguments

mem_model	Is the memory model to use. Possible values are:

`small`	Tells the compiler to restrict code and data to the first 2GB of address space. All accesses of code and data can be done with Instruction Pointer (IP)-relative addressing.
`medium`	Tells the compiler to restrict code to the first 2GB; it places no memory restriction on data. Accesses of code can be done with IP-relative addressing, but accesses of data must be done with absolute addressing.
`large`	Places no memory restriction on code or data. All accesses of code and data must be done with absolute addressing.

Default

`-mcmodel=small`	On systems using Intel® 64 architecture, the compiler restricts code and data to the first 2GB of address space. Instruction Pointer (IP)-relative addressing can be used to access code and data.

Description

This option tells the compiler to use a specific memory model to generate code and store data. It can affect code size and performance. If your program has global and static data with a total size smaller than 2GB, `-mcmodel=small` is sufficient. Global and static data larger than 2GB requires`-mcmodel=medium` or `-mcmodel=large`. Allocation of memory larger than 2GB can be done with any setting of `-mcmodel`.

IP-relative addressing requires only 32 bits, whereas absolute addressing requires 64-bits. IP-relative addressing is somewhat faster. So, the `small` memory model has the least impact on performance.

NOTE
When you specify option `-mcmodel=medium` or `-mcmodel=large`, it sets option `-shared-intel`. This ensures that the correct dynamic versions of the Intel run-time libraries are used.

If you specify option `-static-intel` while `-mcmodel=medium` or `-mcmodel=large` is set, an error will be displayed.

IDE Equivalent

None

Alternate Options

None

Example

The following example shows how to compile using `-mcmodel`:

```
icl -shared-intel -mcmodel=medium -o prog prog.c
```

See Also

`shared-intel` compiler option
`fpic` compiler option

mdynamic-no-pic

Generates code that is not position-independent but has position-independent external references.

Syntax

Linux OS:

`None`

macOS:

`-mdynamic-no-pic`

Windows OS:

`None`

Arguments

None

Default

OFF	All references are generated as position independent.

Description

This option generates code that is not position-independent but has position-independent external references.

The generated code is suitable for building executables, but it is not suitable for building shared libraries.

This option may reduce code size and produce more efficient code. It overrides the `-fpic` compiler option.

IDE Equivalent

None

Alternate Options

None

See Also

`fpic` compiler option

mlong-double

Lets you override the default configuration of the long double data type.

Syntax

Linux OS:

`-mlong-double-`*n*

macOS:

`None`

Windows OS:

`None`

Arguments

n	Specifies the size of the long double data type. Possible values are:	
	`64`	Specifies that the size of the long double data type is 64 bits.
	`80`	Specifies that the size of the long double data type is 80 bits. This is the default.
	`128`	Specifies that the size of the long double data type is 128 bits.

Default

`-mlong-double-80` Specifies that the size of the long double data type is 80 bits.

Description

This option lets you override the default configuration of the long double data type.

When you specify `-mlong-double-64`, the size of the long double data type is 8 bytes and the macro __LONG_DOUBLE_64__ is defined.

When you specify `-mlong-double-80`, the size of the long double data type is 12 bytes on IA-32 architecture and 16 bytes on Intel® 64 architecture.

This option has no effect on floating-point significand precision. That must be specified by using the `-pc64` or `-pc80` option.

Note that this option has no effect when you pass arguments. When you pass arguments, the 64-bit long double data type is treated as the double data type and it is always 64-bit.

Remember to include the math.h and complex.h header files when you use this option.

The following restrictions apply to this option:

- __bultin_* functions using the long double type should not be used in the non-default mode with Intel compiler libraries.
- long double functions from the 'std' namespace should not be called from C++ sources when the non-default mode is set.

IDE Equivalent

Qlong-double

Changes the default size of the long double data type.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Qlong-double`

Arguments

None

Default

OFF	The default size of the long double data type is 64 bits.

Description

This option changes the default size of the long double data type to 80 bits.

However, the alignment requirement of the data type is 16 bytes, and its size must be a multiple of its alignment, so the size of a long double on Windows* is also 16 bytes. Only the lower 10 bytes (80 bits) of the 16 byte space will have valid data stored in it.

NOTE
Using the `Qlong-double` command-line option on Windows* platforms requires that any source code using `double extended precision` floating-point types (FP80) be carefully segregated from source code that was not written in a way that considers or supports their use. When this option is used, source code that makes assumptions or has requirements on the size or layout of an FP80 value may experience a variety of failures at compile time, link time, or run time.

The Microsoft* C Standard Library and Microsoft* C++ Standard Template Library do *not* support FP80 datatypes. In all circumstances where you want to use this option, please check with your library vendor to determine whether they support FP80 datatype formats.

For example, the Microsoft* compiler and Microsoft*-provided library routines (such as `printf` or `long double` math functions) do *not* provide support for 80-bit floating-point values and should not be called from code compiled with the `Qlong-double` command-line option.

Starting with the Microsoft Visual Studio 2019 version 16.10 release, you may get compilation errors when using options /std:c++latest together with /Qlong-double in programs that directly or indirectly include the <complex> header, <xutility> header, or the <cmath> header. To see an example of this, see the Example section below.

IDE Equivalent

None

Alternate Options

None

Example

In the Note above, we mention an issue with using the options /std:c++latest together with /Qlong-double in programs that directly or indirectly include the <complex>, <xutility>, or the <cmath> headers. The following shows an example of this issue:

```
#include <iostream>
#include <complex>

int main()
{long double ld2 = 1256789.98765432106L;int iNan = isnan(ld2);std::cout << "Hello World!\n"; }

ksh-3.2$ icl -c -EHsc -GR    -std:c++latest /Qlong-double /MD  test1.cpp

Qsfalign

Specifies stack alignment for functions. This is a deprecated option that may be removed in a future release.

Architecture Restrictions

Only available on IA-32 architecture. IA-32 support is deprecated and will be removed in a future release.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Qsfalign[`*n*`]`

Arguments

n	Is the byte size of aligned variables. Possible values are:	
	`8`	Specifies that alignment should occur for functions with 8-byte aligned variables. At this setting the compiler aligns the stack to 16 bytes if there is any 16-byte or 8-byte data on the stack. For 8-byte data, the compiler only aligns the stack if the alignment will produce a performance advantage.
	`16`	Specifies that alignment should occur for functions with 16-byte aligned variables. At this setting, the compiler only aligns the stack for 16-byte data. No attempt is made to align for 8-byte data.

Default

`/Qsfalign8`	Alignment occurs for functions with 8-byte aligned variables.

Description

This option specifies stack alignment for functions. It lets you disable the normal optimization that aligns a stack for 8-byte data.

This is a deprecated option that may be removed in a future release. There is no replacement option.

If you do not specify *n*, stack alignment occurs for all functions. If you specify `/Qsfalign-`, no stack alignment occurs for any function.

IDE Equivalent

None

Alternate Options

None

Compiler Diagnostic Options

This section contains descriptions for compiler options that pertain to compiler diagnostics.

diag, Qdiag

Controls the display of diagnostic information during compilation.

Syntax

Linux OS:

`-diag-`*`type`*`=`*`diag-list`*

macOS:

`-diag-`*`type`*`=`*`diag-list`*

Windows OS:

`/Qdiag-`*`type`*`:`*`diag-list`*

Arguments

type	Is an action to perform on diagnostics. Possible values are:	
	`enable`	Enables a diagnostic message or a group of messages. If you specify `-diag-enable=all` (Linux* and macOS) or `/Qdiag-enable:all` (Windows*), all diagnostic messages shown in *diag-list* are enabled.
	`disable`	Disables a diagnostic message or a group of messages. If you specify `-diag-disable=all` (Linux* and macOS) or `/Qdiag-disable:all` (Windows*), all diagnostic messages shown in *diag-list* are disabled.

`error`	Tells the compiler to change diagnostics to errors.
`warning`	Tells the compiler to change diagnostics to warnings.
`remark`	Tells the compiler to change diagnostics to remarks (comments).

diag-list

Is a diagnostic group or ID value. Possible values are:

`driver`	Specifies diagnostic messages issued by the compiler driver.
`port-linux`	Specifies diagnostic messages for language features that may cause errors when porting to Linux* systems. This diagnostic group is only available on Windows* systems.
`port-win`	Specifies diagnostic messages for GNU extensions that may cause errors when porting to Windows. This diagnostic group is only available on Linux and macOS systems.
`thread`	Specifies diagnostic messages that help in thread-enabling a program.
`vec`	Specifies diagnostic messages issued by the vectorizer.
`par`	Specifies diagnostic messages issued by the auto-parallelizer (parallel optimizer).
`openmp`	Specifies diagnostic messages issued by the OpenMP* parallelizer.
`warn`	Specifies diagnostic messages that have a "warning" severity level.
`error`	Specifies diagnostic messages that have an "error" severity level.
`remark`	Specifies diagnostic messages that are remarks or comments.
`cpu-dispatch`	Specifies the CPU dispatch remarks for diagnostic messages. These remarks are enabled by default.
`id[,id,...]`	Specifies the ID number of one or more messages. If you specify more than one message number, they must be separated by commas. There can be no intervening white space between each `id`.

`tag[,tag,...]`	Specifies the mnemonic name of one or more messages. If you specify more than one mnemonic name, they must be separated by commas. There can be no intervening white space between each `tag`.

The diagnostic messages generated can be affected by certain options, such as `[Q]x`, `/arch` (Windows) or `-m` (Linux and macOS).

Default

OFF	The compiler issues certain diagnostic messages by default.

Description

This option controls the display of diagnostic information during compilation. Diagnostic messages are output to stderr unless the `[Q]diag-file` option is specified.

To control the diagnostic information reported by the vectorizer, use options `[q or Q]opt-report` and `[q or Q]opt-report-phase`, phase `vec`.

To control the diagnostic information reported by the auto-parallelizer, use options `[q or Q]opt-report` and `[q or Q]opt-report-phase`, phase `par`.

IDE Equivalent

Visual Studio

Visual Studio: **Diagnostics > Disable Specific Diagnostics** (`/Qdiag-disable:id`)

Advanced > Disable Specific Warnings (`/Qdiag-disable`)

Eclipse

Eclipse: **Compilation Diagnostics > Disable Specific Diagnostics**

Xcode

Xcode: **Diagnostics > Disable Specific Diagnostics**

Alternate Options

enable vec	Linux and macOS: `-qopt-report`;
	`-qopt-report -qopt-report-phase=vec`
	
	Windows: `/Qopt-report`;
	`/Qopt-report /Qopt-report-phase:vec`

disable vec	Linux and macOS: `-qopt-report=0 -qopt-report-phase=vec` Windows: `/Qopt-report:0 /Qopt-report-phase:vec`

enable par	Linux and macOS: `-qopt-report`;
	`-qopt-report -qopt-report-phase=par`
	
	Windows: `/Qopt-report`;
	`/Qopt-report /Qopt-report-phase:par`

disable par	Linux and macOS: `-qopt-report=0 -qopt-report-phase=par` Windows: `/Qopt-report:0 /Qopt-report-phase:par`

Example

The following example shows how to enable diagnostic IDs 117, 230 and 450:

```
-diag-enable=117,230,450     ! Linux and macOSsystems
/Qdiag-enable:117,230,450    ! Windows systems
```

The following example shows how to change vectorizer diagnostic messages to warnings:

```
-diag-enable=vec -diag-warning=vec      ! Linux and macOSsystems
/Qdiag-enable:vec /Qdiag-warning:vec    ! Windows systems
```

Note that you need to enable the vectorizer diagnostics before you can change them to warnings.

The following example shows how to disable all auto-parallelizer diagnostic messages:

```
-diag-disable=par     ! Linux and macOSsystems
/Qdiag-disable:par    ! Windows systems
```

The following example shows how to change all diagnostic warnings and remarks to errors:

```
-diag-error=warn,remark    ! Linux and macOSsystems
/Qdiag-error:warn,remark   ! Windows systems
```

The following example shows how to get a list of *only* vectorization diagnostics:

```
-diag-dump -diag-disable=all -diag-enable=vec        ! Linux and macOSsystems
/Qdiag-dump /Qdiag-disable:all /Qdiag-enable:vec     ! Windows systems
```

See Also

`diag-dump, Qdiag-dump` compiler option

`diag-id-numbers, Qdiag-id-numbers` compiler option

`diag-file, Qdiag-file` compiler option

`qopt-report, Qopt-report` compiler option

`x, Qx` compiler option

diag-dump, Qdiag-dump

Tells the compiler to print all enabled diagnostic messages.

Syntax

Linux OS:

`-diag-dump`

macOS:

`-diag-dump`

Windows OS:

`/Qdiag-dump`

Arguments

None

Default

OFF	The compiler issues certain diagnostic messages by default.

Description

This option tells the compiler to print all enabled diagnostic messages. The diagnostic messages are output to `stdout`.

This option prints the enabled diagnostics from all possible diagnostics that the compiler can issue, including any default diagnostics.

If *diag-list* is specified for the `[Q]diag-enable` option, the print out will include the *diag-list* diagnostics.

IDE Equivalent

None

Alternate Options

None

Example

The following example adds vectorizer diagnostic messages to the printout of default diagnostics:

```
-diag-enable vec -diag-dump          ! Linux and macOS systems
/Qdiag-enable:vec /Qdiag-dump        ! Windows systems
```

See Also

`diag, Qdiag` compiler option

diag-enable=power, Qdiag-enable:power

Controls whether diagnostics are enabled for possibly inefficient code that may affect power consumption on IA-32 and Intel® 64 architectures.

Syntax

Linux OS and macOS:

`-diag-enable=power`

`-diag-disable=power`

Windows OS:

`/Qdiag-enable:power`

`/Qdiag-disable:power`

Arguments

None

Default

`-diag-disable=power` or `/Qdiag-disable:power`	Power consumption diagnostics are disabled.

Description

This option controls whether diagnostics are enabled for possibly inefficient code that may affect power consumption on IA-32 and Intel® 64 architectures.

If you specify option `-diag-enable=power` (Linux* and macOS) or `/Qdiag-enable:power` (Windows*), the compiler will detect various API calls with argument values in ranges known to be inefficient for power consumption. The diagnostic issued will point out the problem argument; for example, "power inefficient use of 'Sleep' with argument in range [0;10]".

IDE Equivalent

None

Alternate Options

None

diag-error-limit, Qdiag-error-limit

Specifies the maximum number of errors allowed before compilation stops.

Syntax

Linux OS:

`-diag-error-limit=`*n*

`-no-diag-error-limit`

macOS:

`-diag-error-limit=`*n*

`-no-diag-error-limit`

Windows OS:

`/Qdiag-error-limit:`*n*

`/Qdiag-error-limit-`

Arguments

n	Is the maximum number of error-level or fatal-level compiler errors allowed.

Default

30	A maximum of 30 error-level and fatal-level messages are allowed.

Description

This option specifies the maximum number of errors allowed before compilation stops. It indicates the maximum number of error-level or fatal-level compiler errors allowed for a file specified on the command line.

If you specify the negative form of the `[Q]diag-error-limit` option on the command line, there is no limit on the number of errors that are allowed.

If the maximum number of errors is reached, a warning message is issued and the next file (if any) on the command line is compiled.

IDE Equivalent

Visual Studio

Visual Studio: **Diagnostics > Error Limit**

Eclipse

Eclipse: **Compilation Diagnostics > Set Error Limit**

Xcode

Xcode: **Diagnostics > Error Limit**

Alternate Options

Linux and macOS: `-wn` (this is a deprecated option)

Windows: `/Qwn` (this is a deprecated option)

diag-file, Qdiag-file

Causes the results of diagnostic analysis to be output to a file.

Syntax

Linux OS:

`-diag-file[=`*`filename`*`]`

macOS:

None

Windows OS:

`/Qdiag-file[:`*`filename`*`]`

Arguments

filename	Is the name of the file for output.

Default

OFF	Diagnostic messages are output to stderr.

Description

This option causes the results of diagnostic analysis to be output to a file. The file is placed in the current working directory.

You can include a file extension in *filename*. For example, if *file.txt* is specified, the name of the output file is *file.txt*. If you do not provide a file extension, the name of the file is *filename.diag*.

If *filename* is not specified, the name of the file is *name-of-the-first-source-file.diag*. This is also the name of the file if the name specified for file conflicts with a source file name provided in the command line.

NOTE
If you specify the `[Q]diag-file` option and you also specify the `[Q]diag-file-append` option, the last option specified on the command line takes precedence.

IDE Equivalent

Windows

Visual Studio: **Diagnostics > Diagnostics File**

Diagnostics > Emit Diagnostics to File

Linux

Eclipse: **Compilation Diagnostics > Diagnostics File**

OS X

Xcode: **Diagnostics > Diagnostics File, Diagnostics > Emit Diagnostics to File**

Alternate Options

None

Example

The following example shows how to cause diagnostic analysis to be output to a file named *my_diagnostics.diag*:

```
-diag-file=my_diagnostics       ! Linux systems
/Qdiag-file:my_diagnostics      ! Windows systems
```

See Also

`diag-file-append, Qdiag-file-append` compiler option

diag-file-append, Qdiag-file-append

Causes the results of diagnostic analysis to be appended to a file.

Syntax

Linux OS:

`-diag-file-append[=`*`filename`*`]`

macOS:

`None`

Windows OS:

`/Qdiag-file-append[:`*`filename`*`]`

Arguments

filename	Is the name of the file to be appended to. It can include a path.

Default

OFF	Diagnostic messages are output to `stderr`.

Description

This option causes the results of diagnostic analysis to be appended to a file. If you do not specify a path, the driver will look for *filename* in the current working directory.

If *filename* is not found, then a new file with that name is created in the current working directory. If the name specified for file conflicts with a source file name provided in the command line, the name of the file is *name-of-the-first-source-file.diag*.

> **NOTE**
> If you specify the `[Q]diag-file-append` option and you also specify the `[Q]diag-file` option, the last option specified on the command line takes precedence.

IDE Equivalent

None

Alternate Options

None

Example

The following example shows how to cause diagnostic analysis to be appended to a file named *my_diagnostics.txt*:

```
-diag-file-append=my_diagnostics.txt       ! Linux systems
/Qdiag-file-append:my_diagnostics.txt      ! Windows systems
```

See Also

`diag-file, Qdiag-file` compiler option

diag-id-numbers, Qdiag-id-numbers

Determines whether the compiler displays diagnostic messages by using their ID number values.

Syntax

Linux OS:

`-diag-id-numbers`

`-no-diag-id-numbers`

macOS:

`-diag-id-numbers`

`-no-diag-id-numbers`

Windows OS:

`/Qdiag-id-numbers`

`/Qdiag-id-numbers-`

Arguments

None

Default

`-diag-id-numbers` or `/Qdiag-id-numbers`	The compiler displays diagnostic messages by using their ID number values.

Description

This option determines whether the compiler displays diagnostic messages by using their ID number values. If you specify the negative form of the `[Q]diag-id-numbers` option, mnemonic names are output for driver diagnostics only.

IDE Equivalent

None

Alternate Options

None

See Also

`diag, Qdiag` compiler option

diag-once, Qdiag-once

Tells the compiler to issue one or more diagnostic messages only once.

Syntax

Linux OS:

`-diag-once`*`id`*`[,`*`id`*`,...]`

macOS:

`-diag-once`*`id`*`[,`*`id`*`,...]`

Windows OS:

`/Qdiag-once:`*`id`*`[,`*`id`*`,...]`

Arguments

id	Is the ID number of the diagnostic message. If you specify more than one message number, they must be separated by commas. There can be no intervening white space between each *id*.

Default

OFF	The compiler issues certain diagnostic messages by default.

Description

This option tells the compiler to issue one or more diagnostic messages only once.

IDE Equivalent

None

Alternate Options

Linux: `-wo` (this is a deprecated option)

Windows: `/Qwo` (this is a deprecated option)

fnon-call-exceptions

Allows trapping instructions to throw C++ exceptions.

Syntax

Linux OS and macOS:

`-fnon-call-exceptions`

`-fno-non-call-exceptions`

Windows OS:

`None`

Arguments

None

Default

`-fno-non-call-exceptions` C++ exceptions are not thrown from trapping instructions.

Description

This option allows trapping instructions to throw C++ exceptions. It allows hardware signals generated by trapping instructions to be converted into C++ exceptions and caught using the standard C++ exception handling mechanism. Examples of such signals are SIGFPE (floating-point exception) and SIGSEGV (segmentation violation).

You must write a signal handler that catches the signal and throws a C++ exception. After that, any occurrence of that signal within a C++ try block can be caught by a C++ catch handler of the same type as the C++ exception thrown within the signal handler.

Only signals generated by trapping instructions (that is, memory access instructions and floating-point instructions) can be caught. Signals that can occur at any time, such as SIGALRM, cannot be caught in this manner.

IDE Equivalent

None

Alternate Options

None

traceback

Tells the compiler to generate extra information in the object file to provide source file traceback information when a severe error occurs at run time.

Syntax

Linux OS:

`-traceback`

`-notraceback`

macOS:

`-traceback`

`-notraceback`

Windows OS:

`/traceback`

`/notraceback`

Arguments

None

Default

`notraceback`	No extra information is generated in the object file to produce traceback information.

Description

This option tells the compiler to generate extra information in the object file to provide source file traceback information when a severe error occurs at run time. This is intended for use with C code that is to be linked into a Fortran program.

When the severe error occurs, source file, routine name, and line number correlation information is displayed along with call stack hexadecimal addresses (program counter trace).

Note that when a severe error occurs, advanced users can also locate the cause of the error using a map file and the hexadecimal addresses of the stack displayed when the error occurs.

This option increases the size of the executable program, but has no impact on run-time execution speeds.

It functions independently of the debug option.

On Windows* systems, `traceback` sets the `/Oy-` option, which forces the compiler to use EBP as the stack frame pointer.

On Windows* systems, the linker places the traceback information in the executable image, in a section named ".trace". To see which sections are in an image, use the command:

```
link -dump -summary your_app_name.exe
```

To see more detailed information, use the command:

```
link -dump -headers your_app_name.exe
```

On Linux* systems, to display the section headers in the image (including the header for the .trace section, if any), use the command:

```
objdump -h your_app_name.exe
```

On macOS systems, to display the section headers in the image, use the command:

```
otool -l your_app_name.exe
```

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Runtime > Generate Traceback Information**

OS X

Xcode: **Runtime > Generate Traceback Information**

Alternate Options

None

w

Disables all warning messages.

Syntax

Linux OS:

`-w`

macOS:

`-w`

Windows OS:

`/w`

Arguments

None

Default

OFF	Default warning messages are enabled.

Description

This option disables all warning messages.

IDE Equivalent

Windows

Visual Studio: **General > Warning Level**

Linux

Eclipse: **General > Warning Level**

OS X

Xcode: **General > Warning Level**

Alternate Options

Linux and macOS: `-w0`

Windows: `/W0`

w, W

Specifies the level of diagnostic messages to be generated by the compiler.

Syntax

Linux OS:

`-wn`

macOS:

`-wn`

Windows OS:

`/Wn`

Arguments

n	Is the level of diagnostic messages to be generated. Possible values are:	
	`0`	Enables diagnostics for errors. Disables diagnostics for warnings.
	`1`	Enables diagnostics for warnings and errors.
	`2`	Enables diagnostics for warnings and errors. On Linux* and macOS systems, additional warnings are enabled. On Windows* systems, this setting is equivalent to level 1 (*n* = 1).
	`3`	Enables diagnostics for remarks, warnings, and errors. Additional warnings are also enabled above level 2 (*n* = 2). This level is recommended for production purposes.
	`4`	Enables diagnostics for all level 3 (*n* = 3) warnings plus informational warnings and remarks, which in most cases can be safely ignored. This value is only available on Windows* systems.
	`5`	Enables diagnostics for all remarks, warnings, and errors. This setting produces the most diagnostic messages. This value is only available on Windows* systems.

Default

n=1	The compiler displays diagnostics for warnings and errors.

Description

This option specifies the level of diagnostic messages to be generated by the compiler.

On Windows systems, option /W4 is equivalent to option /Wall.

The `-wn`, `/Wn`, and `Wall` options can override each other. The last option specified on the command line takes precedence.

IDE Equivalent

Windows

Visual Studio: **General > Warning Level**

Linux

Eclipse: **General > Warning Level**

OS X

Xcode: **General > Warning Level**

Alternate Options

None

See Also

Wall compiler option

Wabi

Determines whether a warning is issued if generated code is not C++ ABI compliant.

Syntax

Linux OS:

`-Wabi`

`-Wno-abi`

macOS:

`-Wabi`

`-Wno-abi`

Windows OS:

None

Arguments

None

Default

`-Wno-abi`	No warning is issued when generated code is not C++ ABI compliant.

Description

This option determines whether a warning is issued if generated code is not C++ ABI compliant.

IDE Equivalent

None

Alternate Options

None

Wall

Enables warning and error diagnostics.

Syntax

Linux OS:

`-Wall`

macOS:

`-Wall`

Windows OS:

`/Wall`

Arguments

None

Default

OFF	Only default warning diagnostics are enabled.

Description

This option enables many warning and error diagnostics.

On Windows* systems, this option is equivalent to the `/W4` option. It enables diagnostics for all level 3 warnings plus informational warnings and remarks.

However, on Linux* and macOS systems, this option is similar to gcc option `-Wall`. It displays all errors and some of the warnings that are typically reported by gcc option `-Wall`. If you want to display all warnings, specify the `-w2` or `-w3` option. If you want to display remarks and comments, specify the `-Wremarks` option.

The `Wall`, `-w`*n*, and `/W`*n* options can override each other. The last option specified on the command line takes precedence.

IDE Equivalent

None

Alternate Options

None

See Also

diag, Qdiag compiler option
Wremarks compiler option
w, W compiler option

Wbrief

Tells the compiler to display a shorter form of diagnostic output.

Syntax

Linux OS and macOS:

`-Wbrief`

Windows OS:

`/WL`

Arguments

None

Default

OFF	The compiler displays its normal diagnostic output.

Description

This option tells the compiler to display a shorter form of diagnostic output. In this form, the original source line is not displayed and the error message text is not wrapped when too long to fit on a single line.

IDE Equivalent

None

Alternate Options

Linux and macOS: None

Windows: `/WL`

Wcheck

Tells the compiler to perform compile-time code checking for certain code.

Syntax

Linux OS and macOS:

`-Wcheck`

Windows OS:

`/Wcheck`

Arguments

None

Default

OFF	No compile-time code checking is performed.

Description

This option tells the compiler to perform compile-time code checking for certain code. It specifies to check for code that exhibits non-portable behavior, represents a possible unintended code sequence, or possibly affects operation of the program because of a quiet change in the ANSI C Standard.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Compilation Diagnostics > Allow Usage Messages**

OS X

Xcode: **Diagnostics > Allow Usage Messages**

Alternate Options

None

Wcheck-unicode-security

Determines whether the compiler performs source code checking for Unicode vulnerabilities.

Syntax

Linux OS:

`-Wcheck-unicode-security`

`-Wno-check-unicode-security`

macOS:

`-Wcheck-unicode-security`

`-Wno-check-unicode-security`

Windows OS:

`/Wcheck-unicode-security`

`/Wno-check-unicode-security`

Arguments

None

Default

`Wno-check-unicode-security`	The compiler does not perform source code checking for Unicode vulnerabilities.

Description

This option determines whether the compiler performs source code checking for Unicode vulnerabilities.

Option `Wcheck-unicode-security` enables Unicode checking. The compiler will detect and warn about Unicode constructs that can be exploited by using bi-directional formatting codes, zero-width characters in strings, and use of zero-width characters and homoglyphs in identifiers.

Option `Wno-check-unicode-security` disables Unicode checking.

IDE Equivalent

Windows

Visual Studio: **C/C++ > Diagnostics [Intel C++] > Check Unicode Security**

Linux

Eclipse: **Intel C++ Compiler Classic > Compilation Diagnostics > Check Unicode Security**

Alternate Options

None

Wcomment

Determines whether a warning is issued when / appears in the middle of a /* */ comment.*

Syntax

Linux OS:

`-Wcomment`

`-Wno-comment`

macOS:

`-Wcomment`

`-Wno-comment`

Windows OS:

None

Arguments

None

Default

`-Wno-comment`	No warning is issued when /* appears in the middle of a /* */ comment.

Description

This option determines whether a warning is issued when /* appears in the middle of a /* */ comment.

IDE Equivalent

None

Alternate Options

None

Wcontext-limit, Qcontext-limit

Set the maximum number of template instantiation contexts shown in diagnostic.

Syntax

Linux OS and macOS:

`-Wcontext-limit=`*n*

Windows OS:

`/Qcontext-limit:`*n*

Arguments

n	Number of template instantiation contexts.

Default

OFF

Description

Set maximum number of template instantiation contexts shown in diagnostic.

IDE Equivalent

None

Alternate Options

None

wd, Qwd

Disables a soft diagnostic. This is a deprecated option that may be removed in a future release.

Syntax

Linux OS and macOS:

`-wdn[,n]...`

Windows OS:

`/Qwdn[,n]...`

Arguments

n	Is the number of the diagnostic to disable.

Default

OFF	The compiler returns soft diagnostics as usual.

Description

This option disables the soft diagnostic that corresponds to the specified number.

This is a deprecated option that may be removed in a future release. The replacement option is `[Q]diag-disable`.

If you specify more than one *n*, each *n* must be separated by a comma.

IDE Equivalent

Windows

Visual Studio: **Advanced > Disable Specific Warnings**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

Linux and macOS: `-diag-disable`

Windows: `/Qdiag-disable`

Wdeprecated

Determines whether warnings are issued for deprecated C++ headers.

Syntax

Linux OS:

`-Wdeprecated`

`-Wno-deprecated`

macOS:

`-Wdeprecated`

`-Wno-deprecated`

Windows OS:

`None`

Arguments

None

Default

`-Wdeprecated`	The compiler issues warnings for deprecated C++ headers.

Description

This option determines whether warnings are issued for deprecated C++ headers. It has no effect in C compilation mode.

Option `-Wdeprecated` enables these warnings by defining the __DEPRECATED macro for preprocessor.

To disable warnings for deprecated C++ headers, specify `-Wno-deprecated`.

IDE Equivalent

None

Alternate Options

None

we, Qwe

Changes a soft diagnostic to an error. This is a deprecated option that may be removed in a future release.

Syntax

Linux OS and macOS:

`-we`*`Ln[,Ln,...]`*

Windows OS:

`/QweLn[,Ln,...]`

Arguments

Ln	Is the number of the diagnostic to be changed.

Default

OFF	The compiler returns soft diagnostics as usual.

Description

This option overrides the severity of the soft diagnostic that corresponds to the specified number and changes it to an error.

This is a deprecated option that may be removed in a future release. The replacement option is `[Q]diag-error`.

Soft diagnostics are diagnostic messages that don't prevent the production of an object file; for example, warnings and remarks.

If you specify more than one *Ln*, each *Ln* must be separated by a comma.

IDE Equivalent

None

Alternate Options

Linux and macOS: `-diag-error`

Windows: `/Qdiag-error`

Weffc++, Qeffc++

Enables warnings based on certain C++ programming guidelines.

Syntax

Linux OS:

`-Weffc++`

macOS:

`-Weffc++`

Windows OS:

`/Qeffc++`

Arguments

None

Default

OFF	Diagnostics are not enabled.

Description

This option enables warnings based on certain programming guidelines developed by Scott Meyers in his books on effective C++ programming. With this option, the compiler emits warnings for these guidelines:

- Use `const` and `inline` rather than `#define`. Note that you will only get this in user code, not system header code.
- Use `<iostream>` rather than `<stdio.h>`.
- Use `new` and `delete` rather than `malloc` and `free`.
- Use C++ style comments in preference to C style comments. C comments in system headers are not diagnosed.
- Use `delete` on pointer members in destructors. The compiler diagnoses any pointer that does not have a `delete`.
- Make sure you have a user copy constructor and assignment operator in classes containing pointers.
- Use initialization rather than assignment to members in constructors.
- Make sure the initialization list ordering matches the declartion list ordering in constructors.
- Make sure base classes have virtual destructors.
- Make sure `operator=` returns `*this`.
- Make sure prefix forms of increment and decrement return a `const` object.
- Never overload operators `&&`, `||`, and `,`.

> **NOTE**
> The warnings generated by this compiler option are based on the following books from Scott Meyers:
>
> - Effective C++ Second Edition - 50 Specific Ways to Improve Your Programs and Designs
> - More Effective C++ - 35 New Ways to Improve Your Programs and Designs

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Compilation Diagnostics > Enable Warnings for Style Guideline Violations**

OS X

Xcode: **Diagnostics > Report Effective C++ Violations**

Alternate Options

None

Werror, WX

Changes all warnings to errors.

Syntax

Linux OS:

`-Werror`

macOS:

`-Werror`

Windows OS:

`/WX`

Arguments

None

Default

OFF	The compiler returns diagnostics as usual.

Description

This option changes all warnings to errors.

IDE Equivalent

Windows

Visual Studio: **General > Treat Warnings As Errors**

Linux

Eclipse: **Compilation Diagnostics > Treat Warnings As Errors**

OS X

Xcode: **Diagnostics > Treat Warnings As Errors**

Alternate Options

Linux and macOS: `-diag-error warn`

Windows: `/Qdiag-error:warn`

Werror-all

Causes all warnings and currently enabled remarks to be reported as errors.

Syntax

Linux OS:

`-Werror-all`

macOS:

`-Werror-all`

Windows OS:

`/Werror-all`

Arguments

None

Default

OFF	The compiler returns diagnostics as usual.

Description

This option causes all warnings and currently enabled remarks to be reported as errors.

To enable display of remarks, specify option `-Wremarks`.

IDE Equivalent

None

Alternate Options

Linux and macOS: `-diag-error warn, remark`

Windows: `/Qdiag-error:warn, remark`

See Also

diag, Qdiag
compiler option

Wremarks
compiler option

Wextra-tokens

Determines whether warnings are issued about extra tokens at the end of preprocessor directives.

Syntax

Linux OS:

`-Wextra-tokens`

`-Wno-extra-tokens`

macOS:

`-Wextra-tokens`

`-Wno-extra-tokens`

Windows OS:

None

Arguments

None

Default

`-Wno-extra-tokens`	The compiler does not warn about extra tokens at the end of preprocessor directives.

Description

This option determines whether warnings are issued about extra tokens at the end of preprocessor directives.

IDE Equivalent

None

Alternate Options

None

Wformat

Determines whether argument checking is enabled for calls to printf, scanf, and so forth.

Syntax

Linux OS:

`-Wformat`

`-Wno-format`

macOS:

`-Wformat`

`-Wno-format`

Windows OS:

None

Arguments

None

Default

`-Wno-format`	Argument checking is not enabled for calls to `printf`, `scanf`, and so forth.

Description

This option determines whether argument checking is enabled for calls to `printf`, `scanf`, and so forth.

IDE Equivalent

None

Alternate Options

None

Wformat-security

Determines whether the compiler issues a warning when the use of format functions may cause security problems.

Syntax

Linux OS:

`-Wformat-security`

`-Wno-format-security`

macOS:

`-Wformat-security`

`-Wno-format-security`

Windows OS:

`None`

Arguments

None

Default

`-Wno-format-security`	No warning is issued when the use of format functions may cause security problems.

Description

This option determines whether the compiler issues a warning when the use of format functions may cause security problems.

When `-Wformat-security` is specified, it warns about uses of format functions where the format string is not a string literal and there are no format arguments.

IDE Equivalent

None

Alternate Options

None

Wic-pointer

Determines whether warnings are issued for conversions between pointers to distinct scalar types with the same representation.

Syntax

Linux OS and macOS:

`-Wic-pointer`

`-Wno-ic-pointer`

Windows OS:

`None`

Arguments

None

Default

`-Wic-pointer`	The compiler issues warnings for conversions between pointers to distinct scalar types with the same representation.

Description

This option determines whether warnings are issued for conversions between pointers to distinct scalar types with the same representation.

For example, consider the following:

```
void f(int *p) { long *q = p; }
```

In this case, by default, the compiler issues a warning because of the conversion from pointer to `int` to pointer to `long`.

However, if you specify `-Wno-ic-pointer`, and `long` and `int` values have the same representation on the target platform, the warning will not be issued.

IDE Equivalent

None

Alternate Options

None

Winline

Warns when a function that is declared as inline is not inlined.

Syntax

Linux OS:

`-Winline`

macOS:

`-Winline`

Windows OS:

None

Arguments

None

Default

OFF	No warning is produced when a function that is declared as inline is not inlined.

Description

This option warns when a function that is declared as inline is not inlined.

To see diagnostic messages, including a message about why a particular function was not inlined, you should generate an optimization report by specifying option `-qopt-report=5`.

IDE Equivalent

None

Alternate Options

None

See Also

`qopt-report, Qopt-report` compiler option

WL

Tells the compiler to display a shorter form of diagnostic output.

Syntax

Linux OS and macOS:

`See Wbrief.`

Windows OS:

`/WL`

Arguments

None

Default

OFF	The compiler displays its normal diagnostic output.

Description

This option tells the compiler to display a shorter form of diagnostic output. In this form, the original source line is not displayed and the error message text is not wrapped when too long to fit on a single line.

IDE Equivalent

None

Alternate Options

Linux and macOS: `-Wbrief`

Windows: None

Wmain

Determines whether a warning is issued if the return type of main is not expected.

Syntax

Linux OS:

`-Wmain`

`-Wno-main`

macOS:

`-Wmain`

`-Wno-main`

Windows OS:

`None`

Arguments

None

Default

`-Wno-main`	No warning is issued if the return type of `main` is not expected.

Description

This option determines whether a warning is issued if the return type of `main` is not expected.

IDE Equivalent

None

Alternate Options

None

Wmissing-declarations

Determines whether warnings are issued for global functions and variables without prior declaration.

Syntax

Linux OS:

`-Wmissing-declarations`

`-Wno-missing-declarations`

macOS:

`-Wmissing-declarations`

`-Wno-missing-declarations`

Windows OS:

`None`

Arguments

None

Default

`-Wno-missing-declarations`	No warnings are issued for global functions and variables without prior declaration.

Description

This option determines whether warnings are issued for global functions and variables without prior declaration.

IDE Equivalent

None

Alternate Options

None

Wmissing-prototypes

Determines whether warnings are issued for missing prototypes.

Syntax

Linux OS:

`-Wmissing-prototypes`

`-Wno-missing-prototypes`

macOS:

`-Wmissing-prototypes`

`-Wno-missing-prototypes`

Windows OS:

`None`

Arguments

None

Default

`-Wno-missing-prototypes`	No warnings are issued for missing prototypes.

Description

Determines whether warnings are issued for missing prototypes.

If `-Wmissing-prototypes` is specified, it tells the compiler to detect global functions that are defined without a previous prototype declaration.

IDE Equivalent

None

Alternate Options

None

wn, Qwn

Controls the number of errors displayed before compilation stops. This is a deprecated option that may be removed in a future release.

Syntax

Linux OS and macOS:

`-wn`*n*

Windows OS:

`/Qwn`*n*

Arguments

n	Is the number of errors to display.

Default

100	The compiler displays a maximum of 100 errors before aborting compilation.

Description

This option controls the number of errors displayed before compilation stops.

This is a deprecated option that may be removed in a future release. The replacement option is `[Q]diag-error-limit`.

IDE Equivalent

Windows

Visual Studio: **Diagnostics > Error Limit**

Linux

Eclipse: **Compilation Diagnostics > Set Error Limit**

OS X

Xcode: **Diagnostics > Error Limit**

Alternate Options

Linux and macOS: `-diag-error-limit`

Windows: `/Qdiag-error-limit`

Wnon-virtual-dtor

Tells the compiler to issue a warning when a class appears to be polymorphic, yet it declares a non-virtual one.

Syntax

Linux OS and macOS:

`-Wnon-virtual-dtor`

Windows OS:

`None`

Arguments

None

Default

OFF	The compiler does not issue a warning.

Description

Tells the compiler to issue a warning when a class appears to be polymorphic, yet it declares a non-virtual one. This option is supported in C++ only.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: None

OS X

Xcode: **Diagnostics > Report Non-Virtual Destructor**

Alternate Options

None

wo, Qwo

Tells the compiler to issue one or more diagnostic messages only once. This is a deprecated option that may be removed in a future release.

Syntax

Linux OS and macOS:

`-wo`*`Ln[,Ln,...]`*

Windows OS:

`/Qwo`*`Ln[,Ln,...]`*

Arguments

Ln	Is the number of the diagnostic.

Default

OFF

Description

Specifies the ID number of one or more messages. If you specify more than one *Ln*, each *Ln* must be separated by a comma.

This is a deprecated option that may be removed in a future release. The replacement option is `[Q]diag-once id`.

IDE Equivalent

None

Alternate Options

Linux and macOS: `-diag-once id`

Windows: `/Qdiag-once:id`

Wp64

Tells the compiler to display diagnostics for 64-bit porting.

Syntax

Linux OS and macOS:

`-Wp64`

Windows OS:

`/Wp64`

Arguments

None

Default

OFF	The compiler does not display diagnostics for 64-bit porting.

Description

This option tells the compiler to display diagnostics for 64-bit porting.

IDE Equivalent

Windows

Visual Studio: **General > Detect 64-bit Portability Issues**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

Wpch-messages

Determines whether the compiler shows precompiled header (PCH) informational messages.

Syntax

Linux OS and macOS:

`-Wpch-messages`

`-Wno-pch-messages`

Windows OS:

`/Wpch-messages`

`-Wpch-messages-`

Arguments

None

Default

`Wpch-messages`	The compiler shows precompiled header (PCH) informational messages.

Description

This option determines whether the compiler shows precompiled header (PCH) informational messages. By default, these messages are displayed.

To suppress the display of the PCH informational messages, specify `-Wno-pch-messages` (Linux* and macOS) or `/Wpch-messages-` (Windows*).

IDE Equivalent

Windows

Visual Studio: **Precompiled Headers [Intel C++] > Disable Precompiled Header Messages**

Linux

Eclipse: **Precompiled Headers > Disable Precompiled Header Messages**

OS X

Xcode: **Precompiled Headers > Disable Precompiled Header Messages**

Alternate Options

None

Wpointer-arith

Determines whether warnings are issued for questionable pointer arithmetic.

Syntax

Linux OS:

`-Wpointer-arith`

`-Wno-pointer-arith`

macOS:

`-Wpointer-arith`

`-Wno-pointer-arith`

Windows OS:

`None`

Arguments

None

Default

`-Wno-pointer-arith`	No warnings are issued for questionable pointer arithmetic.

Description

Determines whether warnings are issued for questionable pointer arithmetic.

IDE Equivalent

None

Alternate Options

None

Wport

Tells the compiler to issue portability diagnostics.

Syntax

Linux OS and macOS:

`None`

Windows OS:

`/Wport`

Arguments

None

Default

OFF	The compiler issues default diagnostics.

Description

This option tells the compiler to issue portability diagnostics.

IDE Equivalent

None

Alternate Options

None

wr, Qwr

Changes a soft diagnostic to an remark. This is a deprecated option that may be removed in a future release.

Syntax

Linux OS and macOS:

`-wr`*`Ln[,Ln,...]`*

Windows OS:

`/QwrLn[,Ln,...]`

Arguments

Ln	Is the number of the diagnostic to be changed.

Default

OFF	The compiler returns soft diagnostics as usual.

Description

This option overrides the severity of the soft diagnostic that corresponds to the specified number and changes it to a remark.

This is a deprecated option that may be removed in a future release. The replacement option is `[Q]diag-remark`.

Soft diagnostics are diagnostic messages that don't prevent the production of an object file; for example, warnings and remarks.

If you specify more than one *Ln*, each *Ln* must be separated by a comma.

IDE Equivalent

None

Alternate Options

Linux and macOS: `-diag-remark`

Windows: `/Qdiag-remark`

Wremarks

Tells the compiler to display remarks and comments.

Syntax

Linux OS and macOS:

`-Wremarks`

Windows OS:

`None`

Arguments

None

Default

OFF	Default warning messages are enabled.

Description

This option tells the compiler to display remarks and comments.

If you want to display warnings and errors, specify the `-Wall`, `-wn`, or `/Wn` option.

IDE Equivalent

None

Alternate Options

None

See Also

diag, Qdiag compiler option
Wall compiler option
w, W compiler option

Wreorder

Tells the compiler to issue a warning when the order of member initializers does not match the order in which they must be executed.

Syntax

Linux OS:

`-Wreorder`

macOS:

`-Wreorder`

Windows OS:

`None`

Arguments

None

Default

OFF	The compiler does not issue a warning.

Description

This option tells the compiler to issue a warning when the order of member initializers does not match the order in which they must be executed. This option is supported for C++ only.

IDE Equivalent

None

Alternate Options

None

Wreturn-type

Determines whether warnings are issued when a function is declared without a return type, when the definition of a function returning void contains a return statement with an expression, or when the closing brace of a function returning non-void is reached.

Syntax

Linux OS:

`-Wreturn-type`

`-Wno-return-type`

macOS:

`-Wreturn-type`

`-Wno-return-type`

Windows OS:

`None`

Arguments

None

Default

ON for one condition	A warning is issued when the closing brace of a function returning non-void is reached.

Description

This option determines whether warnings are issued for the following:

- When a function is declared without a return type
- When the definition of a function returning void contains a return statement with an expression
- When the closing brace of a function returning non-void is reached

Specify `-Wno-return-type` if you do not want to see warnings about the above diagnostics.

IDE Equivalent

None

Alternate Options

None

Wshadow

Determines whether a warning is issued when a variable declaration hides a previous declaration.

Syntax

Linux OS:

`-Wshadow`

`-Wno-shadow`

macOS:

`-Wshadow`

`-Wno-shadow`

Windows OS:

`None`

Arguments

None

Default

`-Wno-shadow`	No warning is issued when a variable declaration hides a previous declaration.

Description

This option determines whether a warning is issued when a variable declaration hides a previous declaration. Same as `-ww1599`.

IDE Equivalent

None

Alternate Options

None

Wsign-compare

Determines whether warnings are issued when a comparison between signed and unsigned values could produce an incorrect result when the signed value is converted to unsigned.

Syntax

Linux OS:

`-Wsign-compare`

`-Wno-sign-compare`

macOS:

`-Wsign-compare`

`-Wno-sign-compare`

Windows OS:

`None`

Arguments

None

Default

`-Wno-sign-compare`	The compiler does not issue these warnings

Description

This option determines whether warnings are issued when a comparison between signed and unsigned values could produce an incorrect result when the signed value is converted to unsigned.

On Linux* systems, this option is provided for compatibility with gcc.

IDE Equivalent

None

Alternate Options

None

Wstrict-aliasing

Determines whether warnings are issued for code that might violate the optimizer's strict aliasing rules.

Syntax

Linux OS:

`-Wstrict-aliasing`

`-Wno-strict-aliasing`

macOS:

`-Wstrict-aliasing`

`-Wno-strict-aliasing`

Windows OS:

None

Arguments

None

Default

`-Wno-strict-aliasing`	No warnings are issued for code that might violate the optimizer's strict aliasing rules.

Description

This option determines whether warnings are issued for code that might violate the optimizer's strict aliasing rules. These warnings will only be issued if you also specify option `-ansi-alias` or option `-fstrict-aliasing`.

IDE Equivalent

None

Alternate Options

None

See Also

ansi-alias, Qansi-alias
compiler option

Wstrict-prototypes

Determines whether warnings are issued for functions declared or defined without specified argument types.

Syntax

Linux OS:

`-Wstrict-prototypes`

`-Wno-strict-prototypes`

macOS:

`-Wstrict-prototypes`

`-Wno-strict-prototypes`

Windows OS:

None

Arguments

None

Default

`-Wno-strict-prototypes`	No warnings are issued for functions declared or defined without specified argument types.

Description

This option determines whether warnings are issued for functions declared or defined without specified argument types.

IDE Equivalent

None

Alternate Options

None

Wtrigraphs

Determines whether warnings are issued if any trigraphs are encountered that might change the meaning of the program.

Syntax

Linux OS:

`-Wtrigraphs`

`-Wno-trigraphs`

macOS:

`-Wtrigraphs`

`-Wno-trigraphs`

Windows OS:

`None`

Arguments

None

Default

`-Wno-trigraphs`	No warnings are issued if any trigraphs are encountered that might change the meaning of the program.

Description

This option determines whether warnings are issued if any trigraphs are encountered that might change the meaning of the program.

IDE Equivalent

None

Alternate Options

None

Wuninitialized

Determines whether a warning is issued if a variable is used before being initialized.

Syntax

Linux OS:

`-Wuninitialized`

`-Wno-uninitialized`

macOS:

`-Wuninitialized`

`-Wno-uninitialized`

Windows OS:

`None`

Arguments

None

Default

`-Wno-uninitialized`	No warning is issued if a variable is used before being initialized.

Description

This option determines whether a warning is issued if a variable is used before being initialized. Equivalent to `-ww592` and `-wd592`.

IDE Equivalent

None

Alternate Options

`-ww592` and `-wd592`

Wunknown-pragmas

Determines whether a warning is issued if an unknown #pragma directive is used.

Syntax

Linux OS:

`-Wunknown-pragmas`

`-Wno-unknown-pragmas`

macOS:

`-Wunknown-pragmas`

`-Wno-unknown-pragmas`

Windows OS:

`None`

Arguments

None

Default

`-Wunknown-pragmas`	A warning is issued if an unknown `#pragma` directive is used.

Description

This option determines whether a warning is issued if an unknown `#pragma` directive is used.

IDE Equivalent

None

Alternate Options

None

Wunused-function

Determines whether a warning is issued if a declared function is not used.

Syntax

Linux OS:

`-Wunused-function`

`-Wno-unused-function`

macOS:

`-Wunused-function`

`-Wno-unused-function`

Windows OS:

`None`

Arguments

None

Default

`-Wno-unused-function`	No warning is issued if a declared function is not used.

Description

This option determines whether a warning is issued if a declared function is not used.

IDE Equivalent

None

Alternate Options

None

Wunused-variable

Determines whether a warning is issued if a local or non-constant static variable is unused after being declared.

Syntax

Linux OS:

`-Wunused-variable`

`-Wno-unused-variable`

macOS:

`-Wunused-variable`

`-Wno-unused-variable`

Windows OS:

`None`

Arguments

None

Default

`-Wno-unused-variable`	No warning is issued if a local or non-constant static variable is unused after being declared.

Description

This option determines whether a warning is issued if a local or non-constant static variable is unused after being declared.

IDE Equivalent

None

Alternate Options

None

ww, Qww

Changes a soft diagnostic to an warning. This is a deprecated option that may be removed in a future release.

Syntax

Linux OS and macOS:

`-wwLn[,Ln,...]`

Windows OS:

`/QwwLn[,Ln,...]`

Arguments

Ln	Is the number of the diagnostic to be changed.

Default

OFF	The compiler returns soft diagnostics as usual.

Description

This option overrides the severity of the soft diagnostic that corresponds to the specified number and changes it to an warning.

This is a deprecated option that may be removed in a future release. The replacement option is `[Q]diag-warning`.

Soft diagnostics are diagnostic messages that don't prevent the production of an object file; for example, warnings and remarks.

If you specify more than one *Ln*, each *Ln* must be separated by a comma.

IDE Equivalent

None

Alternate Options

Linux and macOS: `-diag-warning`

Windows: `/Qdiag-warning`

Wwrite-strings

*Issues a diagnostic message if const char * is converted to (non-const) char *.*

Syntax

Linux OS:

`-Wwrite-strings`

macOS:

`-Wwrite-strings`

Windows OS:

`None`

Arguments

None

Default

OFF	No diagnostic message is issued if const char * is converted to (non-const) char*.

Description

This option issues a diagnostic message if const char* is converted to (non-const) char *.

IDE Equivalent

None

Alternate Options

None

Compatibility Options

This section contains descriptions for compiler options that pertain to language compatibility.

clang-name

Specifies the name of the Clang compiler that should be used to set up the environment for C compilations.

Syntax

Linux OS and macOS:

`-clang-name=`*name*

Windows OS:

`None`

Arguments

name	Is the name of the Clang compiler to use. It can include the path where the Clang compiler is located.

Default

OFF	The compiler uses the PATH setting to find the Clang compiler and resolve environment settings.

Description

This option specifies the name of the Clang compiler that should be used to set up the environment for C compilations. If you do not specify a path, the compiler will search the PATH settings for the compiler name you provide.

This option is helpful when you are referencing a non-standard Clang installation.

The C++ equivalent to option `-clang-name` is `-clangxx-name`.

NOTE
This option applies to the Intel compiler running in a CLANG environment. It does not apply to the Intel CLANG-based compiler.

IDE Equivalent

None

Alternate Options

None

Example

If the following option is specified, the compiler looks for the Clang compiler named `foobar` in the PATH setting:

```
-clang-name=foobar
```

If the following option is specified, the compiler looks for the Clang compiler named `foobar` in the path specified:

```
-clang-name=/a/b/foobar
```

See Also

`clangxx-name` compiler option

clangxx-name

Specifies the name of the Clang++ compiler that should be used to set up the environment for C++ compilations.

Syntax

Linux OS and macOS:

`-clangxx-name=`*`name`*

Windows OS:

`None`

Arguments

name	Is the name of the Clang++ compiler to use. It can include the path where the Clang++ compiler is located.

Default

OFF	The compiler uses the PATH setting to find the Clang++ compiler and resolve environment settings.

Description

This option specifies the name of the Clang++ compiler that should be used to set up the environment for C ++ compilations. If you do not specify a path, the compiler will search the PATH settings for the compiler name you provide.

The C equivalent to option `-clangxx-name` is `-clang-name`.

> **NOTE**
> This option applies to the Intel compiler running in a CLANG environment. It does not apply to the Intel CLANG-based compiler.

IDE Equivalent

None

Alternate Options

None

Example

If the following option is specified, the compiler looks for the Clang++ compiler named `foobar` in the PATH setting:

```
-clangxx-name=foobar
```

If the following option is specified, the compiler looks for the Clang++ compiler named `foobar` in the path specified:

```
-clangxx-name=/a/b/foobar
```

See Also

`clang-name` compiler option

fabi-version

Instructs the compiler to select a specific ABI implementation.

Syntax

Linux OS:

`-fabi-version=`*n*

macOS:

`-fabi-version=`*n*

Windows OS:

None

Arguments

n	Is the ABI implementation. Possible values are:	
	0	Requests the latest ABI implementation.
	1	Requests the ABI implementation used in gcc 3.2 and gcc 3.3.
	2	Requests the ABI implementation used in gcc 3.4 and higher.

Default

Varies	The compiler uses the ABI implementation that corresponds to the installed version of gcc.

Description

This option tells the compiler to select a specific ABI implementation. This option is compatible with gcc option `-fabi-version`. If you have multiple versions of gcc installed, the compiler may change the value of *n* depending on which gcc is detected in your path.

NOTE
gcc 3.2 and 3.3 are not fully ABI-compliant, but gcc 3.4 is highly ABI-compliant.

Caution
Do not mix different values for `-fabi-version` in one link.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Preprocessor > gcc Compatibility Options**

OS X

Xcode: None

Alternate Options

None

fms-dialect

Enables support for a language dialect that is compatible with Microsoft Windows, while maintaining link compatibility with GCC*.*

Syntax

Linux OS:

`-fms-dialect[=ver]`

macOS:

`None`

Windows OS:

`None`

Arguments

ver	Indicates that the language dialect should be compatible with a certain version of Microsoft Visual Studio*. Possible values are: `14.2` — Specifies the dialect should be compatible with Microsoft Visual Studio 2019. `14.1` — Specifies the dialect should be compatible with Microsoft Visual Studio 2017. **NOTE** Support for Microsoft Visual Studio 2017 is deprecated as of the Intel® oneAPI 2022.1 release, and will be removed in a future release.

Default

OFF	The compiler does not support a language dialect that is compatible with Microsoft Windows.

Description

This option enables support for a limited language dialect that is compatible with Microsoft Windows, while maintaining link compatibility with GCC. It allows portability of code written on Windows that uses Microsoft extensions or language features. The code will be compiled with syntax and semantics similar to that used by the Microsoft Windows compiler, while continuing to produce object files that are link-compatible with the object files and libraries produced by the GCC compiler and/or by the Intel Compiler without this option.

The `-fms-dialect` option is intended to be used as an aid in porting code written on Windows. It is not intended to enable an all-encompassing capability for porting all such code written on Windows seamlessly. For example, even with this option enabled, there remains a need to support GCC-compatible syntax and semantics for some language constructs in order to generate object files that are link-time compatible with those produced by the GCC compiler and/or by the Intel compiler without this option.

`Qgcc-dialect` compiler option

gcc-name

Lets you specify the name of the GCC compiler that should be used to set up the environment for C compilations.

Syntax

Linux OS:

`-gcc-name=name`

macOS:

None

Windows OS:

None

Arguments

name	Is the name of the GCC compiler to use. It can include the path where the GCC compiler is located.

Default

OFF	The compiler uses the PATH setting to find the GCC compiler and resolve environment settings.

Description

This option lets you specify the name of the GCC compiler that should be used to set up the environment for C compilations. If you do not specify a path, the compiler will search the PATH settings for the compiler name you provide.

This option is helpful when you are referencing a non-standard GCC installation, or you have multiple GCC installations on your system. The compiler will match GCC version values to the GCC compiler you specify.

The C++ equivalent to option `-gcc-name` is `-gxx-name`.

IDE Equivalent

Visual Studio

Visual Studio: None

Eclipse

Eclipse: **Preprocessor > Nonstandard gcc Installation**

Xcode

Xcode: None

Alternate Options

None

Example

If the following option is specified, the compiler looks for the GCC compiler named `foobar` in the PATH setting:

```
-gcc-name=foobar
```

If the following option is specified, the compiler looks for the GCC compiler named `foobar` in the path specified:

```
-gcc-name=/a/b/foobar
```

See Also

`gxx-name` compiler option

gnu-prefix

Lets you specify a prefix that will be added to the names of gnu utilities called from the compiler.

Syntax

Linux OS:

`-gnu-prefix=`*`prefix`*

macOS:

None

Windows OS:

None

Arguments

prefix	Is a string that prepends the name of gnu tools called from the compiler. The value depends on the gnu toolchain used for a particular operating system. For example, for Wind River* Linux 6.x, the *prefix* value will be `x86_64-wrs-linux-`. You must append a hyphen to *prefix* only if the toolchain prefix ends with a hyphen. You can specify a short name or a pathname: • short name: `-gnu-prefix=`*prefix* In this case, the compiler calls *prefix<gnu_utility>* instead of *<gnu_utility>*. The utility with this name should be in the PATH environment variable. • pathname: `-gnu-prefix=/directory_name/`*prefix* In this case, the compiler calls `/directory_name/`*prefix<gnu_utility>*. The utility with this name will be invoked by its full pathname.

Default

OFF	The compiler calls gnu utilities by their short names, and looks for them in the path specified by the PATH environment variable.

Description

This option lets you specify a prefix that will be added to the names of gnu utilities called from the compiler. This option is available for Linux*-targeted compilers but the host may be either Windows* or Linux*.

If you specify option `-gnu-prefix` with option `-gcc-name` (or `-gxx-name`), the following occurs:

- If a name specified in `-gcc-name` (or `-gxx-name`) contains a full path to a binary then option `-gnu-prefix` has no effect on the specified name; other binutils will have the prefix.
- Otherwise, option `-gnu-prefix` is applied to the name specified in `-gcc-name` (or `-gxx-name`).

The above approach provides flexibility to specify an alternative gcc name outside of the default toolchain. At the same time, if a short name is provided in option `-gcc-name`, it is assumed to be a part of the default toolchain and a prefix will be added.

Instead of using option `-gnu-prefix`, you can create symlinks for the short names of gnu utilities in the toolchain and add them to the PATH. For example, `ld--> i686-wrs-linux-gnu-ld`.

NOTE
Even though this option is not supported for a Windows-to-Windows native compiler, it is supported for a Windows-host to Linux-target compiler.

IDE Equivalent

None

Alternate Options

None

Example

Consider that you are setting up the compiler to produce an application for a Wind River* Linux 6.

Assume that your gnu cross toolchain for the target operating system is located in the following directory:

```
/WRL/60/x86_64-linux/usr/bin/x86_64-wrs-linux
```

and gnu utilities in the toolchain have *prefix*`x86_64-wrs-linux-`.

Assume your sysroot for the target operating system is located in the following directory:

```
/WRL/60/qemux86-64
```

To compile your application for Wind River* Linux 6, you must enter the following commands:

```
export PATH=/WRL/60/x86_64-linux/usr/bin/x86_64-wrs-linux:PATH
icc --sysroot/WRL/60/qemux86-64 -gnu-prefix=x86_64-wrs-linux- app.c
```

The following examples show what happens when you specify both `-gcc-name` and `-gnu-prefix`.

Example 1:

```
Command line: -gcc-name=foobar -gnu-prefix=em64t-
Actual gcc name used in the compiler: em64t-foobar
ld name used in the icc: em64t-ld
```

Example 2:

```
Command line: -gcc-name=/a/b/foobar -gnu-prefix=em64t-
Actual gcc name used in the compiler: /a/b/foobar
ld name used in the icc: em64t-ld
```

`gxx-name` compiler option

`sysroot` compiler option

gxx-name

Lets you specify the name of the g++ compiler that should be used to set up the environment for C++ compilations.

Syntax

Linux OS:

`-gxx-name=`*`name`*

macOS:

None

Windows OS:

None

Arguments

name	Is the name of the g++ compiler to use. It can include the path where the g++ compiler is located.

Default

OFF	The compiler uses the PATH setting to find the g++ compiler and resolve environment settings.

Description

This option lets you specify the name of the g++ compiler that should be used to set up the environment for C++ compilations. If you do not specify a path, the compiler will search the PATH settings for the compiler name you provide.

This option is helpful if you have multiple gcc++ installations on your system. The compiler will match gcc++ version values to the gcc++ compiler you specify.

The C equivalent to option `-gxx-name` is `-gcc-name`.

> **NOTE** When compiling a C++ file with `icpc`, g++ is used to get the environment.

IDE Equivalent

None

Alternate Options

None

Example

If the following option is specified, the compiler looks for the g++ compiler named `foobar` in the PATH setting:

```
-gxx-name=foobar
```

If the following option is specified, the compiler looks for the g++ compiler named `foobar` in the path specified:

```
-gxx-name=/a/b/foobar
```

`gcc-name` compiler option

Qgcc-dialect

Enables support for a limited gcc-compatible dialect on Windows.*

Syntax

Linux OS and macOS:

`None`

Windows OS:

`/Qgcc-dialect:`*`ver`*

Arguments

ver	Indicates the version of the gcc compiler that the limited language dialect should be compatible with. It must be a three-digit number with a value of 440 or higher. The number will be normalized to reflect the gcc compiler version numbering scheme. For example, if you specify 450, it indicates gcc version 4.5.0.

Default

OFF	The compiler does not support a language dialect that is compatible with the gcc compiler.

Description

This option enables support for a limited gcc-compatible dialect on Windows*. It allows portability of code written for the gcc compiler.

This option enables a limited gnu-compatible compiler dialect on Windows. The code will be compiled with syntax and semantics similar to that used by gcc, while continuing to produce object files that are link-compatible with the object files and libraries on Windows (that is, object files and libraries produced by the Microsoft compiler and/or by the Intel compiler without this option).

The `/Qgcc-dialect` option is intended to be used as an aid in porting code written for the gcc compiler. It is not intended to enable an all-encompassing capability for porting all such code written for the gcc compiler seamlessly. For example, even with this option enabled, there remains a need to support Windows-compatible syntax and semantics for some language constructs in order to generate object files that are link-time compatible with those produced by the Windows compiler and/or by the Intel compiler without this option.

compiler option

Qms

Tells the compiler to emulate Microsoft compatibility bugs.*

Syntax

Linux OS and macOS:

`None`

Windows OS:

`/Qms`*n*

Arguments

n	Possible values are:	
	`0`	Instructs the compiler to disable some Microsoft* compatibility bugs. It tells the compiler to emulate the fewest number of Microsoft compatibility bugs.
	`1`	Instructs the compiler to enable most Microsoft compatibility bugs. It tells the compiler to emulate more Microsoft compatibility bugs than `/Qms0`.
	`2`	Instructs the compiler to generate code that is Microsoft compatible. The compiler emulates the largest number of Microsoft compatibility bugs.

Default

`/Qms1`	The compiler emulates most Microsoft* compatibility bugs.

Description

This option tells the compiler to emulate Microsoft* compatibility bugs.

Caution
When using `/Qms0`, your program may not compile if it depends on Microsoft headers with compatibility bugs that are disabled with this option. Use `/Qms1` if your compilation fails.

IDE Equivalent

None

Alternate Options

None

Qvc

Specifies compatibility with Microsoft Visual C++ (MSVC) or Microsoft Visual Studio*.*

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Qvc14.2`

`/Qvc14.1`

Arguments

None

Default

varies	When the compiler is installed, it detects which version of Microsoft Visual Studio is on your system. `Qvc` defaults to the form of the option that is compatible with that version. When multiple versions of Microsoft Visual Studio are installed, the compiler installation lets you select which version you want to use. In this case, `Qvc` defaults to the version you choose.

Description

This option specifies compatibility with MSVC or Microsoft Visual Studio.

Option	Description
`/Qvc14.2`	Specifies compatibility with Microsoft Visual Studio 2019.
`/Qvc14.1`	Specifies compatibility with Microsoft Visual Studio 2017.

NOTE
Support for Microsoft Visual Studio 2017 is deprecated as of the Intel® oneAPI 2022.1 release, and will be removed in a future release.

IDE Equivalent

None

Alternate Options

None

stdlib

Lets you select the C++ library to be used for linking.

Syntax

Linux OS:

None

macOS:

-stdlib[=*keyword*]

Windows OS:

None

Arguments

keyword	Is the function information to include. Possible values are:	
	libc++	Links using the libc++ library.
	libstdc++	Links using the GNU libstdc++ library.

Default

-stdlib=libc++	The compiler links using the libc++ library.

Description

This option lets you select the C++ library to be used for linking. This option is processed by the command that initiates linking, adding library names explicitly to the link command.

Currently, if you do not specify this option, the libc++ headers and library are used.

> **NOTE**
> The IDE provides another possible setting for option -stdlib, which lets you choose the compiler default rather than a specific library.

IDE Equivalent

Visual Studio

Visual Studio: None

Eclipse

Eclipse: None

Xcode

Xcode: **Language > C++ standard library > libstdc++**

Language > C++ standard library > libc++

Language > C++ standard library > compiler-default

Alternate Options

None

vmv

Enables pointers to members of any inheritance type.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/vmv`

Arguments

None

Default

OFF	The compiler uses default rules to represent pointers to members.

Description

This option enables pointers to members of any inheritance type. To use this option, you must also specify option `/vmg`.

IDE Equivalent

None

Alternate Options

None

Linking or Linker Options

This section contains descriptions for compiler options that pertain to linking or to the linker.

Bdynamic

Enables dynamic linking of libraries at run time.

Syntax

Linux OS:

`-Bdynamic`

macOS:

`None`

Windows OS:

`None`

Arguments

None

Default

OFF	Limited dynamic linking occurs.

Description

This option enables dynamic linking of libraries at run time. Smaller executables are created than with static linking.

This option is placed in the linker command line corresponding to its location on the user command line. It controls the linking behavior of any library that is passed using the command line.

All libraries on the command line following option `-Bdynamic` are linked dynamically until the end of the command line or until a `-Bstatic` option is encountered. The `-Bstatic` option enables static linking of libraries.

IDE Equivalent

None

Alternate Options

None

See Also

`Bstatic` compiler option

Bstatic

Enables static linking of a user's library.

Syntax

Linux OS:

`-Bstatic`

macOS:

`None`

Windows OS:

`None`

Arguments

None

Default

OFF	Default static linking occurs.

Description

This option enables static linking of a user's library.

This option is placed in the linker command line corresponding to its location on the user command line. It controls the linking behavior of any library that is passed using the command line.

All libraries on the command line following option `-Bstatic` are linked statically until the end of the command line or until a `-Bdynamic` option is encountered. The `-Bdynamic` option enables dynamic linking of libraries.

IDE Equivalent

None

Alternate Options

None

See Also

`Bdynamic` compiler option

Bsymbolic

Binds references to all global symbols in a program to the definitions within a user's shared library.

Syntax

Linux OS:

`-Bsymbolic`

macOS:

`None`

Windows OS:

`None`

Arguments

None

Default

OFF	When a program is linked to a shared library, it can override the definition within the shared library.

Description

This option binds references to all global symbols in a program to the definitions within a user's shared library.

This option is only meaningful on Executable Linkage Format (ELF) platforms that support shared libraries.

Caution
This option can have unintended side-effects of disabling symbol preemption in the shared library.

IDE Equivalent

None

Alternate Options

None

See Also

`Bsymbolic-functions` compiler option

Bsymbolic-functions

Binds references to all global function symbols in a program to the definitions within a user's shared library.

Syntax

Linux OS:

`-Bsymbolic-functions`

macOS:

`None`

Windows OS:

`None`

Arguments

None

Default

OFF	When a program is linked to a shared library, it can override the definition within the shared library.

Description

This option binds references to all global function symbols in a program to the definitions within a user's shared library.

This option is only meaningful on Executable Linkage Format (ELF) platforms that support shared libraries.

> **Caution**
> This option can have unintended side-effects of disabling symbol preemption in the shared library.

IDE Equivalent

None

Alternate Options

None

`Bsymbolic` compiler option

cxxlib

Determines whether the compiler links using the C++ run-time libraries and header files provided by gcc.

Syntax

Linux OS:

`-cxxlib[=dir]`

`-cxxlib-nostd`

`-no-cxxlib`

macOS:

None

Windows OS:

None

Arguments

dir	Is an optional top-level location for the gcc binaries and libraries.

Default

C++: `-cxxlib` C: `-no-cxxlib`	For C++, the compiler uses the run-time libraries and headers provided by gcc. For C, the compiler uses the default run-time libraries and headers and does not link to any additional C++ run-time libraries and headers. However, if you specify compiler option `-std=gnu++98`, the default is `-cxxlib`.

Description

This option determines whether the compiler links using the C++ run-time libraries and header files provided by gcc.

If you specify *dir* for `cxxlib`, the compiler uses `dir/bin/gcc` to setup the environment.

Option `-cxxlib=`*dir* can be used with option `-gcc-name=`*name* to specify the location `dir/bin/name`.

Option `-cxxlib-nostd` prevents the compiler from linking with the standard C++ library.

IDE Equivalent

Visual Studio

Visual Studio: None

Eclipse

Eclipse: **Preprocessor > gcc Compatibility Options**

Xcode

Xcode: None

Alternate Options

None

`gcc-name` compiler option

dynamic-linker

Specifies a dynamic linker other than the default.

Syntax

Linux OS:

`-dynamic-linker file`

macOS:

`None`

Windows OS:

`None`

Arguments

file	Is the name of the dynamic linker to be used.

Default

OFF	The default dynamic linker is used.

Description

This option lets you specify a dynamic linker other than the default.

IDE Equivalent

None

Alternate Options

None

dynamiclib

Invokes the libtool command to generate dynamic libraries.

Syntax

Linux OS:

`None`

macOS:

`-dynamiclib`

Windows OS:

`None`

Arguments

None

Default

OFF	The compiler produces an executable.

Description

This option invokes the `libtool` command to generate dynamic libraries.

When passed this option, the compiler uses the `libtool` command to produce a dynamic library instead of an executable when linking.

To build static libraries, you should specify option `-staticlib` or `libtool -static <objects>`.

IDE Equivalent

None

Alternate Options

None

See Also

staticlib compiler option

F (Windows*)

Specifies the stack reserve amount for the program.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Fn`

Arguments

n	Is the stack reserve amount. It can be specified as a decimal integer or as a hexadecimal constant by using a C-style convention (for example, /F0x1000).

Default

OFF	The stack size default is chosen by the operating system.

Description

This option specifies the stack reserve amount for the program. The amount (*n*) is passed to the linker.

Note that the linker property pages have their own option to do this.

IDE Equivalent

None

Alternate Options

None

F (macOS)

Adds a framework directory to the head of an include file search path.

Syntax

Linux OS:

`None`

macOS:

`-Fdir`

Windows OS:

`None`

Arguments

dir	Is the name for the framework directory.

Default

OFF	The compiler does not add a framework directory to the head of an include file search path.

Description

This option adds a framework directory to the head of an include file search path.

IDE Equivalent

None

Alternate Options

None

fixed

Causes the linker to create a program that can be loaded only at its preferred base address.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/fixed`

Arguments

None

Default

OFF	The compiler uses default methods to load programs.

Description

This option is passed to the linker, causing it to create a program that can be loaded only at its preferred base address.

IDE Equivalent

None

Alternate Options

None

Fm

Tells the linker to generate a link map file. This is a deprecated option that may be removed in a future release.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Fm[filename|dir]`

Arguments

filename	Is the name for the link map file.
dir	Is the directory where the link map file should be placed. It can include *file*.

Default

OFF	No link map is generated.

Description

This option tells the linker to generate a link map.

This is a deprecated option that may be removed in a future release. There is no replacement option.

IDE Equivalent

None

Alternate Options

None

fuse-ld

Tells the compiler to use a different linker instead of the default linker (ld).

Syntax

Linux OS:

`-fuse-ld=`*`keyword`*

macOS:

`-fuse-ld=`*`keyword`*

Windows OS:

None

Arguments

keyword	Possible values are:	
	`bfd`	Tells the compiler to use the bfd linker.
	`gold`	Tells the compiler to use the gold linker.

Default

ld	The compiler uses the ld linker by default.

Description

This option tells the compiler to use a different linker instead of default linker (ld).

This option is provided for compatibility with gcc.

IDE Equivalent

None

Alternate Options

None

l

Tells the linker to search for a specified library when linking.

Syntax

Linux OS:

`-l`*`string`*

macOS:

`-l`*`string`*

Windows OS:

`None`

Arguments

string	Specifies the library (lib*string*) that the linker should search.

Default

OFF	The linker searches for standard libraries in standard directories.

Description

This option tells the linker to search for a specified library when linking.

When resolving references, the linker normally searches for libraries in several standard directories, in directories specified by the `L` option, then in the library specified by the `l` option.

The linker searches and processes libraries and object files in the order they are specified. So, you should specify this option following the last object file it applies to.

IDE Equivalent

None

Alternate Options

None

See Also

`L` compiler option

L

Tells the linker to search for libraries in a specified directory before searching the standard directories.

Syntax

Linux OS:

`-L`*`dir`*

macOS:

`-L`*`dir`*

Windows OS:

`None`

Arguments

dir	Is the name of the directory to search for libraries.

Default

OFF	The linker searches the standard directories for libraries.

Description

This option tells the linker to search for libraries in a specified directory before searching for them in the standard directories.

IDE Equivalent

None

Alternate Options

None

See Also

`l` compiler option

LD

Specifies that a program should be linked as a dynamic-link (DLL) library.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/LD`

`/LDd`

Arguments

None

Default

OFF	The program is not linked as a dynamic-link (DLL) library.

Description

This option specifies that a program should be linked as a dynamic-link (DLL) library instead of an executable (.exe) file. You can also specify `/LDd`, where *d* indicates a debug version.

IDE Equivalent

None

Alternate Options

None

link

Passes user-specified options directly to the linker at compile time.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/link`

Arguments

None

Default

OFF	No user-specified options are passed directly to the linker.

Description

This option passes user-specified options directly to the linker at compile time.

All options that appear following `/link` are passed directly to the linker.

IDE Equivalent

None

Alternate Options

None

`Xlinker` compiler option

MD

Tells the linker to search for unresolved references in a multithreaded, dynamic-link run-time library.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/MD`

`/MDd`

Arguments

None

Default

OFF	The linker searches for unresolved references in a multi-threaded, static run-time library.

Description

This option tells the linker to search for unresolved references in a multithreaded, dynamic-link (DLL) run-time library. You can also specify `/MDd`, where `d` indicates a debug version.

This option is processed by the compiler, which adds directives to the compiled object file that are processed by the linker.

IDE Equivalent

Visual Studio

Visual Studio: **Code Generation > Runtime Library**

Eclipse

Eclipse: None

Xcode

Xcode: None

Alternate Options

None

MT

Tells the linker to search for unresolved references in a multithreaded, static run-time library.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/MT`

`/MTd`

Arguments

None

Default

`/MT`	The linker searches for unresolved references in a multithreaded, static run-time library.

Description

This option tells the linker to search for unresolved references in a multithreaded, static run-time library. You can also specify `/MTd`, where `d` indicates a debug version.

This option is processed by the compiler, which adds directives to the compiled object file that are processed by the linker.

nostdlib compiler option

no-intel-lib, Qno-intel-lib

Disables linking to specified Intel® libraries, or to all Intel® libraries.

Syntax

Linux OS:

`-no-intel-lib[=`*`library`*`]`

macOS:

`None`

Windows OS:

`/Qno-intel-lib[:library]`

Arguments

library	Indicates which Intel® library should *not* be linked. Possible values are:	
	`libirc`	Disables linking to the Intel® C/C++ library.
	`libimf`	Disables linking to the Intel® C++ Compiler Classic Math library. This value is only available for Linux*.
	`libsvml`	Disables linking to the Intel® Short Vector Math library.
	`libirng`	Disables linking to the Random Number Generator library.
	`libipgo`	Disables linking to the Profile-Guided Optimization library.

If you specify more than one *library*, they must be separated by commas.

If *library* is omitted, the compiler will not link to any of the Intel® libraries shown above.

Default

OFF	If this option is not specified, the compiler uses default heuristics for linking to libraries.

Description

This option disables linking to specified Intel® libraries, or to all Intel® libraries.

IDE Equivalent

None

Alternate Options

None

nostartfiles

Prevents the compiler from using standard startup files when linking.

Syntax

Linux OS:

`-nostartfiles`

macOS:

`-nostartfiles`

Windows OS:

`None`

Arguments

None

Default

OFF	The compiler uses standard startup files when linking.

Description

This option prevents the compiler from using standard startup files when linking.

IDE Equivalent

None

Alternate Options

None

`nostdlib` compiler option

nostdlib

Prevents the compiler from using standard libraries and startup files when linking.

Syntax

Linux OS:

`-nostdlib`

macOS:

`-nostdlib`

Windows OS:

`None`

Arguments

None

Default

OFF	The compiler uses standard startup files and standard libraries when linking.

Description

This option prevents the compiler from using standard libraries and startup files when linking. On Linux* systems, it is provided for GNU compatibility.

This option is not related to option `-stdlib`.

IDE Equivalent

None

Alternate Options

None

See Also

`nodefaultlibs` compiler option

`nostartfiles` compiler option

pie

Determines whether the compiler generates position-independent code that will be linked into an executable.

Syntax

Linux OS:

`-pie`

`-no-pie`

macOS:

`-pie`

`-no-pie`

Windows OS:

`None`

Arguments

None

Default

varies	On Linux* and on macOS versions less than 10.7, the default is -no-pie. On macOS 10.7 or greater, the default is -pie.

Description

This option determines whether the compiler generates position-independent code that will be linked into an executable. To enable generation of position-independent code that will be linked into an executable, specify `-pie`.

To disable generation of position-independent code that will be linked into an executable, specify `-no-pie`.

IDE Equivalent

`fpic` compiler option

pthread

Tells the compiler to use pthreads library for multithreading support.

Syntax

Linux OS:

`-pthread`

macOS:

`-pthread`

Windows OS:

`None`

Arguments

None

Default

OFF	The compiler does not use pthreads library for multithreading support.

Description

Tells the compiler to use pthreads library for multithreading support.

IDE Equivalent

None

Alternate Options

None

shared

Tells the compiler to produce a dynamic shared object instead of an executable.

Syntax

Linux OS:

`-shared`

macOS:

`None`

Windows OS:

`None`

Arguments

None

Default

OFF	The compiler produces an executable.

Description

This option tells the compiler to produce a dynamic shared object (DSO) instead of an executable. This includes linking in all libraries dynamically and passing `-shared` to the linker.

You must specify option `fpic` for the compilation of each object file you want to include in the shared library.

IDE Equivalent

None

Alternate Options

None

shared-intel

Causes Intel-provided libraries to be linked in dynamically.

Syntax

Linux OS:

`-shared-intel`

macOS:

`-shared-intel`

Windows OS:

None

Arguments

None

Default

OFF	Intel® libraries are linked in statically, with the exception of Intel's OpenMP* runtime support library, which is linked in dynamically unless you specify option `-qopenmp-link=static`.

Description

This option causes Intel-provided libraries to be linked in dynamically. It is the opposite of `-static-intel`.

This option is processed by the icc or icpc command that initiates linking, adding library names explicitly to the link command.

If you specify option `-mcmodel=medium` or `-mcmodel=large`, it sets option `-shared-intel`.

> **NOTE**
> On macOS systems, when you set "Intel Runtime Libraries" to "Dynamic", you must also set the DYLD_LIBRARY_PATH environment variable within Xcode* or an error will be displayed.

IDE Equivalent

Visual Studio

Visual Studio: None

Eclipse

Eclipse: None

Xcode

Xcode: **Runtime > Intel Runtime Libraries**

Alternate Options

None

See Also

`static-intel` compiler option
`qopenmp-link` compiler option

shared-libgcc

Links the GNU libgcc library dynamically.

Syntax

Linux OS:

`-shared-libgcc`

macOS:

`None`

Windows OS:

`None`

Arguments

None

Default

`-shared-libgcc`	The compiler links the `libgcc` library dynamically.

Description

This option links the GNU `libgcc` library dynamically. It is the opposite of option `static-libgcc`.

This option is processed by the icc or icpc command that initiates linking, adding library names explicitly to the link command.

This option is useful when you want to override the default behavior of the `static` option, which causes all libraries to be linked statically.

IDE Equivalent

None

Alternate Options

None

See Also

static-libgcc compiler option

static

Prevents linking with shared libraries.

Syntax

Linux OS:

`-static`

macOS:

None

Windows OS:

None

Arguments

None

Default

OFF	The compiler links with shared libraries except as otherwise specified by `-static-intel` or its default.

Description

This option prevents linking with shared libraries. It causes the executable to link all libraries statically.

> **NOTE**
> This option does not cause static linking of libraries for which no static version is available, such as the OpenMP run-time libraries on Windows*. These libraries can only be linked dynamically.

IDE Equivalent

Visual Studio

Visual Studio: None

Eclipse

Eclipse: **Libraries > Link with static libraries**

Xcode

Xcode: None

Alternate Options

None

See Also

`static-intel` compiler option

static-intel

Causes Intel-provided libraries to be linked in statically.

Syntax

Linux OS:

`-static-intel`

macOS:

`-static-intel`

Windows OS:

`None`

Arguments

None

Default

ON	Intel® libraries are linked in statically, with the exception of Intel's OpenMP* runtime support library, which is linked in dynamically unless you specify option `-qopenmp-link=static`.

Description

This option causes Intel-provided libraries to be linked in statically with certain exceptions (see the Default above). It is the opposite of `-shared-intel`.

This option is processed by the icc or icpc command that initiates linking, adding library names explicitly to the link command.

If you specify option `-static-intel` while option `-mcmodel=medium` or `-mcmodel=large` is set, an error will be displayed.

If you specify option `-static-intel` and any of the Intel-provided libraries have no static version, a diagnostic will be displayed.

IDE Equivalent

Visual Studio

Visual Studio: None

Eclipse

Eclipse: None

Xcode

Xcode: **Runtime > Intel Runtime Libraries**

Alternate Options

None

`shared-intel` compiler option

`qopenmp-link` compiler option

static-libgcc

Links the GNU libgcc library statically.

Syntax

Linux OS:

`-static-libgcc`

macOS:

None

Windows OS:

None

Arguments

None

Default

OFF	The compiler links the GNU `libgcc` library dynamically.

Description

This option links the GNU `libgcc` library statically. It is the opposite of option `-shared-libgcc`.

This option is processed by the icc or icpc command that initiates linking, adding library names explicitly to the link command.

This option is useful when you want to override the default behavior, which causes the library to be linked dynamically.

> **NOTE**
> If you want to use traceback, you must also link to the static version of the `libgcc` library. This library enables printing of backtrace information.

IDE Equivalent

None

Alternate Options

None

See Also

`shared-libgcc` compiler option
`static-libstdc++` compiler option

static-libstdc++

Links the GNU libstdc++ library statically.

Syntax

Linux OS:

`-static-libstdc++`

macOS:

`None`

Windows OS:

`None`

Arguments

None

Default

OFF	The compiler links the GNU `libstdc++` library dynamically.

Description

This option links the GNU `libstdc++` library statically.

This option is processed by the icc or icpc command that initiates linking, adding library names explicitly to the link command.

This option is useful when you want to override the default behavior, which causes the library to be linked dynamically.

IDE Equivalent

None

Alternate Options

None

See Also

`static-libgcc` compiler option

staticlib

Invokes the libtool command to generate static libraries.

Syntax

Linux OS:

`None`

macOS:

`-staticlib`

Windows OS:

`None`

Arguments

None

Default

OFF	The compiler produces an executable.

Description

This option invokes the `libtool` command to generate static libraries. This option is processed by the command that initiates linking, adding library names explicitly to the link command.

When passed this option, the compiler uses the `libtool` command to produce a static library instead of an executable when linking.

To build dynamic libraries, you should specify option `-dynamiclib` or `libtool -dynamic <objects>`.

IDE Equivalent

None

Alternate Options

None

See Also

dynamiclib compiler option

T

Tells the linker to read link commands from a file.

Syntax

Linux OS:

`-T`*`filename`*

macOS:

None

Windows OS:

None

Arguments

filename	Is the name of the file.

Default

OFF	The linker does not read link commands from a file.

Description

This option tells the linker to read link commands from a file.

IDE Equivalent

None

Alternate Options

None

u (Linux*)

Tells the compiler the specified symbol is undefined.

Syntax

Linux OS:

`-u` *`symbol`*

macOS:

`-u` *`symbol`*

Windows OS:

`None`

Arguments

None

Default

OFF	Standard rules are in effect for variables.

Description

This option tells the compiler the specified *symbol* is undefined.

IDE Equivalent

None

Alternate Options

None

v

Specifies that driver tool commands should be displayed and executed.

Syntax

Linux OS:

`-v [`*`filename`*`]`

macOS:

`-v [`*`filename`*`]`

Windows OS:

`None`

Arguments

filename	Is the name of a source file to be compiled. A space must appear before the file name.

Default

OFF	No tool commands are shown.

Description

This option specifies that driver tool commands should be displayed and executed.

If you use this option without specifying a source file name, the compiler displays only the version of the compiler.

IDE Equivalent

None

Alternate Options

None

See Also

`dryrun` compiler option

Wa

Passes options to the assembler for processing.

Syntax

Linux OS:

`-Wa,`*`option1`*`[,`*`option2`*`,...]`

macOS:

`-Wa,`*`option1`*`[,`*`option2`*`,...]`

Windows OS:

`None`

Arguments

option	Is an assembler option. This option is not processed by the driver and is directly passed to the assembler.

Default

OFF	No options are passed to the assembler.

Description

This option passes one or more options to the assembler for processing. If the assembler is not invoked, these options are ignored.

IDE Equivalent

None

Alternate Options

None

Wl

Passes options to the linker for processing.

Syntax

Linux OS:

`-Wl,`*`option1`*`[,`*`option2`*`,...]`

macOS:

`-Wl,`*`option1`*`[,`*`option2`*`,...]`

Windows OS:

`None`

Arguments

option	Is a linker option. This option is not processed by the driver and is directly passed to the linker.

Default

OFF	No options are passed to the linker.

Description

This option passes one or more options to the linker for processing. If the linker is not invoked, these options are ignored.

This option is equivalent to specifying option `-Qoption,link,`*options*.

IDE Equivalent

None

Alternate Options

None

See Also

`Qoption` compiler option

Wp

Passes options to the preprocessor.

Syntax

Linux OS:

`-Wp,`*`option1`*`[,`*`option2`*`,...]`

macOS:

`-Wp,`*`option1`*`[,`*`option2`*`,...]`

Windows OS:

`None`

Arguments

option	Is a preprocessor option. This option is not processed by the driver and is directly passed to the preprocessor.

Default

OFF	No options are passed to the preprocessor.

Description

This option passes one or more options to the preprocessor. If the preprocessor is not invoked, these options are ignored.

This option is equivalent to specifying option `-Qoption,`*cpp, options*.

IDE Equivalent

None

Alternate Options

None

See Also

`Qoption` compiler option

Xlinker

Passes a linker option directly to the linker.

Syntax

Linux OS:

`-Xlinker` *option*

macOS:

`-Xlinker` *option*

Windows OS:

`None`

Arguments

option	Is a linker option.

Default

OFF	No options are passed directly to the linker.

Description

This option passes a linker option directly to the linker. If `-Xlinker -shared` is specified, only `-shared` is passed to the linker and no special work is done to ensure proper linkage for generating a shared object. `-Xlinker` just takes whatever arguments are supplied and passes them directly to the linker.

If you want to pass compound options to the linker, for example "`-L $HOME/lib`", you must use the following method:

```
-Xlinker -L -Xlinker $HOME/lib
```

IDE Equivalent

Visual Studio: None

`link` compiler option

Zl

Causes library names to be omitted from the object file.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Zl`

Arguments

None

Default

OFF	Default or specified library names are included in the object file.

Description

This option causes library names to be omitted from the object file.

IDE Equivalent

Windows

Visual Studio: **Advanced > Omit Default Library Names**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

Miscellaneous Options

This section contains descriptions for compiler options that do not pertain to a specific category.

bigobj

Increases the number of sections that an object file can contain.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/bigobj`

Arguments

None

Default

OFF	An object file can hold up to 65,536 (2**16) addressable sections.

Description

This option increases the number of sections that an object file can contain. It increases the address capacity to 4,294,967,296(2**32).

This option may be helpful for .obj files that can hold more sections, such as machine generated code or code that makes heavy use of template libraries.

IDE Equivalent

None

Alternate Options

None

dryrun

Specifies that driver tool commands should be shown but not executed.

Syntax

Linux OS:

`-dryrun`

macOS:

`-dryrun`

Windows OS:

`None`

Arguments

None

Default

OFF	No tool commands are shown, but they are executed.

Description

This option specifies that driver tool commands should be shown but not executed.

IDE Equivalent

None

Alternate Options

None

See Also

`v` compiler option

dumpmachine

Displays the target machine and operating system configuration.

Syntax

Linux OS:

`-dumpmachine`

macOS:

`-dumpmachine`

Windows OS:

`None`

Arguments

None

Default

OFF	The compiler does not display target machine or operating system information.

Description

This option displays the target machine and operating system configuration. No compilation is performed.

IDE Equivalent

None

Alternate Options

None

See Also

`dumpversion` compiler option

dumpversion

Displays the version number of the compiler.

Syntax

Linux OS:

`-dumpversion`

macOS:

`-dumpversion`

Windows OS:

`None`

Arguments

None

Default

OFF	The compiler does not display the compiler version number.

Description

This option displays the version number of the compiler. It does not compile your source files.

IDE Equivalent

None

Alternate Options

None

Example

Consider the following command:

```
icc -dumpversion
```

If the above is specified when using version 19.1 of the compiler, the compiler displays "19.1".

See Also

`dumpmachine` compiler option

global-hoist, Qglobal-hoist

Enables certain optimizations that can move memory loads to a point earlier in the program execution than where they appear in the source.

Syntax

Linux OS:

`-global-hoist`

`-no-global-hoist`

macOS:

`-global-hoist`

`-no-global-hoist`

Windows OS:

`/Qglobal-hoist`

`/Qglobal-hoist-`

Arguments

None

Default

`-global-hoist` or `/Qglobal-hoist`	Certain optimizations are enabled that can move memory loads.

Description

This option enables certain optimizations that can move memory loads to a point earlier in the program execution than where they appear in the source. In most cases, these optimizations are safe and can improve performance.

The negative form of the option is useful for some applications, such as those that use shared or dynamically mapped memory, which can fail if a load is moved too early in the execution stream (for example, before the memory is mapped).

IDE Equivalent

None

Alternate Options

None

help

Displays all supported compiler options or supported compiler options within a specified category of options.

Syntax

Linux OS:

`-help[`*`category`*`]`

macOS:

`-help[`*`category`*`]`

Windows OS:

`/help[category]`

Arguments

category

Is a category or class of options to display. Possible values are:

`advanced`	Displays advanced optimization options that allow fine tuning of compilation or allow control over advanced features of the compiler.
`codegen`	Displays Code Generation options.
`compatibility`	Displays options affecting language compatibility.
`component`	Displays options for component control.
`data`	Displays options related to interpretation of data in programs or the storage of data.
`deprecated`	Displays options that have been deprecated.
`diagnostics`	Displays options that affect diagnostic messages displayed by the compiler.
`float`	Displays options that affect floating-point operations.
`help`	Displays all the available help categories.
`inline`	Displays options that affect inlining.
`ipo`	Displays Interprocedural Optimization (IPO) options
`language`	Displays options affecting the behavior of the compiler language features.
`link`	Displays linking or linker options.
`misc`	Displays miscellaneous options that do not fit within other categories.
`openmp`	Displays OpenMP and parallel processing options.
`opt`	Displays options that help you optimize code.
`output`	Displays options that provide control over compiler output.
`pgo`	Displays Profile Guided Optimization (PGO) options.
`preproc`	Displays options that affect preprocessing operations.
`reports`	Displays options for optimization reports.

Default

OFF	No list is displayed unless this compiler option is specified.

Description

This option displays all supported compiler options or supported compiler options within a specified category of options. If you specify *category*, it will display all available (supported) compiler options in the specified category.

On Linux* systems, this option can also be specified as `--help`.

IDE Equivalent

None

Alternate Options

Linux and macOS: None

Windows: `/?`

intel-freestanding

Lets you compile in the absence of a gcc environment.

Syntax

Linux OS:

`-intel-freestanding[=`*ver*`]`

macOS:

`None`

Windows OS:

`None`

Arguments

ver	Is a three-digit number that is used to determine the gcc version that the compiler should be compatible with for compilation. It also sets the corresponding GNUC macros. The number will be normalized to reflect the gcc compiler version numbering scheme. For example, if you specify 493, it indicates the compiler should be compatible with gcc version 4.9.3.

Default

OFF	The compiler uses default heuristics when choosing the gcc environment.

Description

This option lets you compile in the absence of a gcc environment. It disables any external compiler calls (such as calls to gcc) that the compiler driver normally performs by default.

This option also removes any default search locations for header and library files. So, for successful compilation and linking, you must provide these search locations.

This option does not affect ld, as, or cpp. They will be used for compilation as needed.

NOTE
This option does not imply option `-nostdinc -nostdlib`. If you want to assure a clean environment for compilation (including removal of Intel-specific header locations and libs), you should specify `-nostdinc` and/or `-nostdlib`.

NOTE
This option is supported for any Linux-target compiler, including a Windows-host to Linux-target compiler.

IDE Equivalent

None

Alternate Options

None

See Also

intel-freestanding-target-os compiler option
nostdlib compiler option
nostdinc compiler option, which is an alternate option for option X

intel-freestanding-target-os

Lets you specify the target operating system for compilation.

Syntax

Linux OS:

`-intel-freestanding-target-os=`*os*

macOS:

None

Windows OS:

None

Arguments

os	Is the target operating system for the Linux compiler. Currently, the only possible value is `linux`.

Default

OFF	The installed gcc determines the target operating system.

Description

This option lets you specify the target operating system for compilation. It sets option `-intel-freestanding`.

NOTE
This option is supported for any Linux-target compiler, including a Windows-host to Linux-target compiler.

IDE Equivalent

None

Alternate Options

None

See Also

intel-freestanding compiler option

MP-force

Disables the default heuristics used when compiler option /MP is specified. This lets you control the number of processes spawned.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/MP-force`

Arguments

None

Default

OFF	Default heuristics are used when option `/MP` is specified.

Description

This option disables the default heuristics used when compiler option `/MP:`*n* is specified. You must specify it when you specify option `/MP:`*n*.

Option `/MP:`*n* sets the maximum number of processes that can be used to compile large numbers of source files at the same time. However, default heuristics may cause the number of processes to be less than specified.

Option `/MP-force` ensures that *n* will be the maximum number of processes spawned regardless of other heuristics which may limit the number of processes.

IDE Equivalent

None

Alternate Options

None

See Also

`multiple-processes, MP` compiler option

multibyte-chars, Qmultibyte-chars

Determines whether multi-byte characters are supported.

Syntax

Linux OS:

`-multibyte-chars`

`-no-multibyte-chars`

macOS:

`-multibyte-chars`

`-no-multibyte-chars`

Windows OS:

`/Qmultibyte-chars`

`/Qmultibyte-chars-`

Arguments

None

Default

`-multibyte-chars` or `/Qmultibyte-chars`	Multi-byte characters are supported.

Description

This option determines whether multi-byte characters are supported.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **Language > Support Multibyte Characters in Source**

OS X

Xcode: **Language > Support Multibyte Characters in Source**

Alternate Options

None

multiple-processes, MP

Creates multiple processes that can be used to compile large numbers of source files at the same time.

Syntax

Linux OS:

`-multiple-processes[=`*n*`]`

macOS:

`-multiple-processes[=`*n*`]`

Windows OS:

`/MP[:`*n*`]`

Arguments

n	Is the maximum number of processes that the compiler should create.

Default

OFF	A single process is used to compile source files.

Description

This option creates multiple processes that can be used to compile large numbers of source files at the same time. It can improve performance by reducing the time it takes to compile source files on the command line.

This option causes the compiler to create one or more copies of itself, each in a separate process. These copies simultaneously compile the source files.

If *n* is not specified for this option, the default value is as follows:

- On Windows* systems, the value is based on the setting of the NUMBER_OF_PROCESSORS environment variable.
- On Linux* and macOS systems, the value is 2.

This option applies to compilations, but not to linking or link-time code generation.

To override default heuristics, specify option `/MP-force`. It ensures that *n* will be the maximum number of processes created regardless of other heuristics that may limit the number of processes.

IDE Equivalent

Windows

Visual Studio: **General > Multi-processor Compilation**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

See Also

`MP-force` compiler option

nologo

Tells the compiler to not display compiler version information.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/nologo`

Arguments

None

Default

OFF

Description

Tells the compiler to not display compiler version information.

IDE Equivalent

Windows

Visual Studio: **General > Suppress Startup Banner**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

print-sysroot

Prints the target sysroot directory that is used during compilation.

Syntax

Linux OS:

`-print-sysroot`

macOS:

`None`

Windows OS:

None

Arguments

None

Default

OFF	Nothing is printed.

Description

This option prints the target sysroot directory that is used during compilation.

This is the target sysroot directory that is specified in an environment file or in option `--sysroot`. This option is only effective if a target sysroot has been specified.

This option is provided for compatibility with gcc.

> **NOTE**
> Even though this option is not supported for a Windows-to-Windows native compiler, it is supported for a Windows-host to Linux-target compiler.

IDE Equivalent

None

Alternate Options

None

See Also

`sysroot` compiler option

save-temps, Qsave-temps

Tells the compiler to save intermediate files created during compilation.

Syntax

Linux OS:

`-save-temps`

`-no-save-temps`

macOS:

`-save-temps`

`-no-save-temps`

Windows OS:

`/Qsave-temps`

`/Qsave-temps-`

Arguments

None

Default

Linux* and macOS systems: `-no-save-temps` Windows* systems: .obj files are saved	On Linux and macOS systems, the compiler deletes intermediate files after compilation is completed. On Windows systems, the compiler saves only intermediate object files after compilation is completed.

Description

This option tells the compiler to save intermediate files created during compilation. The names of the files saved are based on the name of the source file; the files are saved in the current working directory.

If option `[Q]save-temps` is specified, the following occurs:

- The object .o file (Linux and macOS) or .obj file (Windows) is saved.
- The assembler .s file (Linux and macOS) or .asm file (Windows) is saved if you specified the `[Q]use-asm` option.

If `-no-save-temps` is specified on Linux or macOS systems, the following occurs:

- The .o file is put into `/tmp` and deleted after calling `ld`.
- The preprocessed file is not saved after it has been used by the compiler.

If `/Qsave-temps-` is specified on Windows systems, the following occurs:

- The .obj file is not saved after the linker step.
- The preprocessed file is not saved after it has been used by the compiler.

NOTE
This option only saves intermediate files that are normally created during compilation.

IDE Equivalent

None

Alternate Options

None

Example

If you compile program `my_foo.c` on a Linux or macOS system and you specify option `-save-temps` and option `-use-asm`, the compilation will produce files `my_foo.o` and `my_foo.s`.

If you compile program `my_foo.c` on a Windows system and you specify option `/Qsave-temps` and option `/Quse-asm`, the compilation will produce files `my_foo.o` and `my_foo.asm`.

showIncludes

Tells the compiler to display a list of the include files.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/showIncludes`

Arguments

None

Default

OFF	The compiler does not display a list of the include files.

Description

This option tells the compiler to display a list of the include files. Nested include files (files that are included from the files that you include) are also displayed.

IDE Equivalent

Windows

Visual Studio: **Advanced > Show Includes**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

None

sox

Tells the compiler to save the compilation options and version number in the executable file. It also lets you choose whether to include lists of certain functions.

Syntax

Linux OS:

`-sox[=`*`keyword`*`[,`*`keyword`*`]]`

`-no-sox`

macOS:

`None`

Windows OS:

None

Arguments

keyword	Is the function information to include. Possible values are:	
	`inline`	Includes a list of the functions that were inlined in each object.
	`profile`	Includes a list of the functions that were compiled with the `-prof-use` option and for which the .dpi file had profile information, and an indication for each as to whether the profile information was USED (matched) or IGNORED (mismatched).

Default

`-no-sox`	The compiler does not save these informational strings in the object file.

Description

This option tells the compiler to save the compilation options and version number in the executable file. It also lets you choose whether to include lists of certain functions. The information is embedded as a string in each object file or assembly output.

If you specify option `sox` with no *keyword*, the compiler saves the compiler options and version number used in the compilation of the objects that make up the executable.

When you specify this option, the size of the executable on disk is increased slightly. Each *keyword* you specify increases the size of the executable. When you link the object files into an executable file, the linker places each of the information strings into the header of the executable. It is then possible to use a tool, such as a strings utility, to determine what options were used to build the executable file.

IDE Equivalent

None

Alternate Options

None

Example

The following commands are equivalent:

```
-sox=profile -sox=inline
-sox=profile,inline
```

You can use the negative form of the option to disable and reset the option. For example:

```
-sox=profile -no-sox -sox=inline      ! This means -sox=inline
```

See Also

`prof-use, Qprof-use` compiler option

sysroot

Specifies the root directory where headers and libraries are located.

Syntax

Linux OS:

`--sysroot=`*`dir`*

macOS:

`None`

Windows OS:

`None`

Arguments

dir	Specifies the local directory that contains copies of target libraries in the corresponding subdirectories.

Default

Off	The compiler uses default settings to search for headers and libraries.

Description

This option specifies the root directory where headers and libraries are located.

For example, if the headers and libraries are normally located in `/usr/include` and `/usr/lib` respectively, `--sysroot=/mydir` will cause the compiler to search in `/mydir/usr/include` and `/mydir/usr/lib` for the headers and libraries.

This option is provided for compatibility with gcc.

> **NOTE**
> Even though this option is not supported for a Windows-to-Windows native compiler, it is supported for a Windows-host to Linux-target compiler.

IDE Equivalent

None

Alternate Options

None

Tc

Tells the compiler to process a file as a C source file.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Tc`*`filename`*

Arguments

filename	Is the file name to be processed as a C source file.

Default

OFF	The compiler uses default rules for determining whether a file is a C source file.

Description

This option tells the compiler to process a file as a C source file.

IDE Equivalent

None

Alternate Options

None

See Also

`TC` compiler option
`Tp` compiler option

TC

Tells the compiler to process all source or unrecognized file types as C source files.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/TC`

Arguments

None

Default

OFF	The compiler uses default rules for determining whether a file is a C source file.

Description

This option tells the compiler to process all source or unrecognized file types as C source files.

IDE Equivalent

Windows

Visual Studio: **Advanced > Compile As**

Linux

Eclipse: None

OS X

Xcode: None

Alternate Options

`TP` compiler option

`Tc` compiler option

Tp

Tells the compiler to process a file as a C++ source file.

Syntax

Linux OS:

`None`

macOS:

`None`

Windows OS:

`/Tp`*`filename`*

Arguments

filename	Is the file name to be processed as a C++ source file.

Default

OFF	The compiler uses default rules for determining whether a file is a C++ source file.

Description

This option tells the compiler to process a file as a C++ source file.

IDE Equivalent

None

Alternate Options

None

See Also

`TP` compiler option

`Tc` compiler option

V

Displays the compiler version information.

Syntax

Linux OS:

`-V`

macOS:

`-V`

Windows OS:

`/QV`

Arguments

None

Default

OFF	The compiler version information is not displayed.

Description

This option displays the startup banner, which contains the following compiler information:

- The name of the compiler and its applicable architecture
- The major and minor version of the compiler, the update number, and the package number(for example, Version 12.1.0.047)
- The specific build and build date (for example, Build <builddate>)
- The copyright date of the software

This option can be placed anywhere on the command line.

IDE Equivalent

Windows

Visual Studio: None

Linux

Eclipse: **General > Show Startup Banner**

OS X

Xcode: **General > Show Startup Banner**

Alternate Options

None

version

Tells the compiler to display GCC-style version information.

Syntax

Linux OS:

`--version`

macOS:

`--version`

Windows OS:

None

Arguments

None

Default

OFF

Description

Tells the compiler to display GCC-style version information.

IDE Equivalent

None

Alternate Options

None

watch

Tells the compiler to display certain information to the console output window.

Syntax

Linux OS:

`-watch[=`*keyword*`[, `*keyword*`...]]`

`-nowatch`

macOS:

`-watch[=`*keyword*`[, `*keyword*`...]]`

`-nowatch`

Windows OS:

`/watch[:`*keyword*`[, `*keyword*`...]]`

`/nowatch`

Arguments

keyword	Determines what information is displayed. Possible values are:	
	`none`	Disables `cmd` and `source`.

`[no]cmd`	Determines whether driver tool commands are displayed and executed.
`[no]source`	Determines whether the name of the file being compiled is displayed.
`all`	Enables `cmd` and `source`.

Default

`nowatch`	Pass information and source file names are not displayed to the console output window.

Description

Tells the compiler to display processing information (pass information and source file names) to the console output window.

Option `watch` *`keyword`*	**Description**
`none`	Tells the compiler to not display pass information and source file names to the console output window. This is the same as specifying `nowatch`.
`cmd`	Tells the compiler to display and execute driver tool commands.
`source`	Tells the compiler to display the name of the file being compiled.
`all`	Tells the compiler to display pass information and source file names to the console output window. This is the same as specifying `watch` with no *keyword*. For heterogeneous compilation, the tool commands for the host and the offload compilations will be displayed.

IDE Equivalent

None

Alternate Options

`watch cmd`	Linux and macOS: `-v` Windows: None

`v` compiler option

Deprecated and Removed Compiler Options

This topic lists deprecated and removed compiler options and suggests replacement options, if any are available.

For more information on compiler options, see the detailed descriptions of the individual option descriptions in this section.

Deprecated Options

Occasionally, compiler options are marked as "deprecated." Deprecated options are still supported in the current release, but are planned to be unsupported in future releases.

The following two tables list options that are currently deprecated.

Note that deprecated options are not limited to these lists.

Deprecated Linux* and macOSOptions	Suggested Replacement
axS	axSSE4.1
axT	Linux*: axSSSE3 macOS: axSSSE3
fmudflap	None; consider using the Pointer Checker options (such as option check pointers)
Kc++	x c++
march=pentiumii	None
march=pentiumiii	march=pentium3
mcpu	mtune
msse	Linux* only: mia32
prof-gen-sampling	None
prof-use-sampling	None
rcd	None
use-asm	None
wd	diag-disable
we	diag-error
wn	diag-error-limit
wo	diag-once id[,id,...]
wr	diag-remark
ww	diag-warning
xH	xSSE4.2
xS	xSSE4.1
xT	Linux*: xSSSE3 macOS: xSSSE3

Deprecated Windows* Options	Suggested Replacement
arch:SSE	arch:IA32
Fr	FR
Ge	Gs0
GX	EHsc
GZ	RTC1
H	None

Deprecated Windows* Options	Suggested Replacement
QaxS	QaxSSE4.1
QaxT	QaxSSSE3
QIfist	Qrcd
Qrcd	None
Qsox	None
Quse-asm	None
Qwd	Qdiag-disable
Qwe	Qdiag-error
Qwn	Qdiag-error-limit:<n>
Qwo	Qdiag-once
Qwr	Qdiag-remark
Qww	Qdiag-warning
QxH	QxSSE4.2
QxS	QxSSE4.1
QxT	QxSSSE3
Yd	Z7, Zi, or Zl
Ze	None
Zg	None

Removed Options

Some compiler options are no longer supported and have been removed. If you use one of these options, the compiler issues a warning, ignores the option, and then proceeds with compilation.

The following two tables list options that are no longer supported.

Note that removed options are not limited to these lists.

Removed Linux* and macOSOptions	Suggested Replacement
A-	undef
0f_check	None
alias-args	fargument-alias
axB	axSSE2
axH	axSSE4.2
axi	None

Removed Linux* and macOSOptions	Suggested Replacement
axK	No exact replacement; upgrade to msse2
axM	None
axN	Linux*: axSSE2 macOS: None
axP	Linux*: axSSE3 macOS: None
axW	msse2
c99	std=c99
check-uninit	check=uninit
create-pch	pch-create
cxxlib-gcc[=dir]	cxxlib[=dir]
cxxlib-icc	None
export	None
export-dir	None
F	P
falign-stack=mode	None; this option is only removed on macOS
fdiv_check	None
fms-dialect (macOS only)	None
fms-dialect=11 fms-dialect=10 fms-dialect=9	None
fp	fno-omit-frame-pointer
fpstkchk	fp-stack-check
func-groups	prof-func-groups
fvisibility=internal	fvisibility=hidden
fwritable-strings	None
gcc-version	No exact replacement; use gcc-name
guide-profile	None
i-dynamic	shared-intel
i-static	static-intel
inline-debug-info	debug inline-debug-info

Removed Linux* and macOSOptions	Suggested Replacement
ipo-obj (and ipo_obj)	None
ipp-link=static-thread	None
Knopic, -KNOPIC	fpic
Kpic, -KPIC	fpic
mp	fp-model
no-alias-args	fargument-noalias
no-c99	std=c89
no-cpprt	no-cxxlib
nobss-init	no-bss-init
norestrict	no-restrict
Ob	inline-level
openmp	qopenmp
openmp-lib	qopenmp-lib
openmp-lib legacy	None
openmp-link and qopenmp-link	None
openmpP	qopenmp
openmp-profile	None
openmp-report	qopt-report-phase=openmp
openmpS	qopenmp-stubs
openmp-simd	qopenmp-simd
openmp-stubs	qopenmp-stubs
openmp-task	qopenmp-task
openmp-threadprivate	qopenmp-threadprivate
opt-args-in-regs	qopt-args-in-regs
opt-assume-safe-padding	qopt-assume-safe-padding
opt-block-factor	qopt-block-factor
opt-calloc	qopt-calloc
opt-class-analysis	qopt-class-analysis
opt-dynamic-align	qopt-dynamic-align
opt-gather-scatter-unroll	None

Removed Linux* and macOSOptions	Suggested Replacement
opt-jump-tables	qopt-jump-tables
opt-malloc-options	qopt-malloc-options
opt-matmul	qopt-matmul
opt-mem-layout-trans	qopt-mem-layout-trans
opt-multi-version-aggressive	qopt-multi-version-aggressive
opt-prefetch	qopt-prefetch
opt-prefetch-distance	qopt-prefetch-distance
opt-ra-region-strategy	qopt-ra-region-strategy
opt-report	qopt-report
opt-report-embed	qopt-report-embed
opt-report-file	qopt-report-file
opt-report-filter	qopt-report-filter
opt-report-format	qopt-report-format
opt-report-help	qopt-report-help
opt-report-level	qopt-report
opt-report-per-object	qopt-report-per-object
opt-report-phase	qopt-report-phase
opt-report-routine	qopt-report-routine
opt-streaming-cache-evict	None
opt-streaming-stores	qopt-streaming-stores
opt-subscript-in-range	qopt-subscript-in-range
par-report	qopt-report-phase=par
prefetch	qopt-prefetch
prof-format-32	None
prof-genx	prof-gen=srcpos
profile-functions	None
profile-loops	None
profile-loops-report	None
qoffload	None
qoffload-arch	None

Removed Linux* and macOSOptions	Suggested Replacement
qoffload-attribute-target	None
qoffload-option	None
qopenmp-offload	None
qopenmp-report	qopt-report-phase=openmp
qopenmp-task	None
qp	p
rct	None
shared-libcxa	shared-libgcc
ssp	None
static-libcxa	static-libgcc
std=c9x	std=c99
syntax	fsyntax-only
tcheck	None
tpp1	None
tpp2	mtune=itanium2
tpp5	None
tpp6	None
tpp7	mtune=pentium4
tprofile	None
use-pch	pch-use
vec-report	qopt-report-phase=vec
Wpragma-once	None
xB	xSSE2
xi	None
xK	No exact replacement; upgrade to msse2
xM	None
xN	Linux*: xSSE2 macOS: None
xO	-msse3
xP	Linux*: xSSE3 macOS: None

Removed Linux* and macOSOptions	Suggested Replacement
xSSE3_ATOM	xATOM_SSSE3
xSSSE3_ATOM	xATOM_SSSE3
xW	msse2

Removed Windows* Options	Suggested Replacement
debug:parallel	None
G5	None
G6 (or GB)	None
G7	None
Gf	GF
ML[d]	Upgrade to MT[d]
Og	O1, O2, or O3
Op	fp:precise
QA-	u
QaxB	QaxSSE2
QaxH	QaxSSE4.2
Qaxi	None

Product and Performance Information
Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex. Notice revision #20201201

Display Option Information

To display a list of all available compiler options, specify option `help` on the command line.

To display functional groupings of compiler options, specify a functional category for option `help`. For example, to display a list of options that affect diagnostic messages, enter one of the following commands:

Linux and macOS

```
-help diagnostics
```

Windows

```
/help diagnostics
```

For details on other categories you can specify, see help.

Alternate Compiler Options

This topic lists alternate names for compiler options and show the primary option name. Some of the alternate option names are deprecated and may be removed in future releases.

For more information on compiler options, see the detailed descriptions of the individual, primary options.

Some of these options are deprecated. For more information, see Deprecated and Removed Options.

Linux

Alternate Linux* and macOS Options	Primary Option Name
Code Generation:	
`-fp`	-fomit-frame-pointer
`-mcpu`	-mtune
Advanced Optimizations:	
`-fstrict-aliasing`	-ansi-alias

Alternate Linux* and macOS Options	Primary Option Name
`-funroll-loops`	-unroll
Profile Guided Optimization (PGO):	
`-qp`	-p (Linux* only)
OpenMP* and Parallel Processing Options:	
`-fopenmp`	-qopenmp
Output, Debug, Precompiled Header (PCH):	
`-fvar-tracking`	-debug variable-locations
`-fvar-tracking-assignments`	-debug semantic-stepping
Linking or Linker:	
`-i-dynamic`	-shared-intel
`-i-static`	-static-intel

Windows

Alternate Windows* Options	Primary Option Name
OpenMP* and Parallel Processing Options:	
`/openmp`	/Qopenmp
Floating Point:	
`/QIfist`	/Qrcd

Portability and GCC-compatible Warning Options

This section discusses portability options and GCC-compatible warning options.

Portability Options

A challenge in porting applications from one compiler to another is making sure that there is support for the compiler options you use to build your application. The Intel® compiler supports many of the options that are valid on other compilers you may be using.

The first table lists compiler options that are supported by the Intel® compiler and the GCC Compiler. Following this table, you will see information about GCC-compatible warning options.

The second table lists compiler options that are supported by the Intel® compiler and the Microsoft C++ Compiler .

Options that are unique to either compiler are not listed in this topic.

Linux

This table lists compiler options that are supported by both the Intel® compiler and the GCC Compiler.

The Intel® compiler recognizes many GCC-compatible warning options, but many are not documented.

In general, if a GCC-compatible option is accepted by the compiler, but not documented, the implementation of the option is the same as described in the GCC documentation.

To find the GCC documentation about GCC warning options, you can do any of the following:

- Enter the command:

```
man gcc
```

- Check the GCC website.
- Search the web for "gcc warning options".

Windows

This table lists compiler options that are supported by both the Intel® compiler and the Microsoft C++ Compiler.

Floating-Point Operations

This section contains information about floating-point operations, including IEEE floating-point operations, and it provides guidelines that can help you improve the performance of floating-point applications.

Programming Tradeoffs in Floating-Point Applications

In general, the programming objectives for floating-point applications fall into the following categories:

- **Accuracy:** The application produces results that are close to the correct result.
- **Reproducibility and portability:** The application produces consistent results across different runs, different sets of build options, different compilers, different platforms, and different architectures.
- **Performance:** The application produces fast, efficient code.

Based on the goal of an application, you will need to make tradeoffs among these objectives. For example, if you are developing a 3D graphics engine, performance may be the most important factor to consider, with reproducibility and accuracy as secondary concerns.

The compiler provides several options that allow you to tune your applications based on specific objectives. Broadly speaking, there are the floating-point specific options, such as the `-fp-model` (Linux* and macOS) or `/fp` (Windows*) option, and the fast-but-low-accuracy options, such as the `[Q]imf-max-error` option. The compiler optimizes and generates code differently when you specify these different compiler options. Select appropriate compiler options by carefully balancing your programming objectives and making tradeoffs among these objectives. Some of these options may influence the choice of math routines that are invoked.

Many routines in the *libirc*, *libm*, and *svml* library are more highly optimized for Intel microprocessors than for non-Intel microprocessors.

Use Floating-Point Options

Take the following code as an example:

```
float t0, t1, t2;
 ...
t0=t1+t2+4.0f+0.1f;
```

If you specify the `-fp-model extended` (Linux and macOS) or `/fp:extended` (Windows) option in favor of accuracy, the compiler generates the following assembly code:

```
fld       DWORD PTR _t1
fadd      DWORD PTR _t2
fadd      DWORD PTR _Cnst4.0
fadd      DWORD PTR _Cnst0.1
fstp      DWORD PTR _t0
```

This code maximizes accuracy because it utilizes the highest mantissa precision available on the target platform. The code performance might suffer when managing the x87 stack, and it might yield results that cannot be reproduced on other platforms that do not have an equivalent extended precision type.

If you specify the `-fp-model source` (Linux and macOS) or `/fp:source` (Windows) option in favor of reproducibility and portability, the compiler generates the following assembly code:

```
movss     xmm0, DWORD PTR _t1
addss     xmm0, DWORD PTR _t2
addss     xmm0, DWORD PTR _Cnst4.0
addss     xmm0, DWORD PTR _Cnst0.1
movss     DWORD PTR _t0, xmm0
```

This code maximizes portability by preserving the original order of the computation, and by using the IEEE single-precision type for all computations. It is not as accurate as the previous implementation, because the intermediate rounding error is greater compared to extended precision. It is not the highest performance implementation, because it does not take advantage of the opportunity to pre-compute `4.0f + 0.1f`.

If you specify the `-fp-model fast` (Linux and macOS) or `/fp:fast` (Windows) option in favor of performance, the compiler generates the following assembly code:

```
movss     xmm0, DWORD PTR _Cnst4.1
addss     xmm0, DWORD PTR _t1
addss     xmm0, DWORD PTR _t2
movss     DWORD PTR _t0, xmm0
```

This code maximizes performance using Intel® Streaming SIMD Extensions (Intel® SSE) instructions and pre-computing `4.0f + 0.1f`. It is not as accurate as the first implementation, due to the greater intermediate rounding error. It does not provide reproducible results like the second implementation, because it must reorder the addition to pre-compute `4.0f + 0.1f`. All compilers, on all platforms, at all optimization levels do not reorder the addition in the same way.

For many other applications, the considerations may be more complicated.

Use Fast-But-Low-Accuracy Options

The fast-but-low-accuracy options provide an easy way to control the accuracy of mathematical functions and utilize performance/accuracy tradeoffs offered by the Intel® oneAPI Math Kernel Library (oneMKL). You can specify accuracy, via a command line interface, for all math functions or a selected set of math functions at the level more precise than low, medium, or high.

You specify the accuracy requirements as a set of function attributes that the compiler uses for selecting an appropriate function implementation in the math libraries. Examples using the attribute, `max-error`, are presented here. For example, use the following option to specify the relative error of two ULPs for all single, double, long double, and quad precision functions:

```
-fimf-max-error=2
```

To specify twelve bits of accuracy for a `sin` function, use:

```
-fimf-accuracy-bits=12:sin
```

To specify relative error of ten ULPs for a `sin` function, and four ULPs for other math functions called in the source file you are compiling, use:

```
-fimf-max-error=10:sin-fimf-max-error=4
```

On Windows systems, the compiler defines the default value for the `max-error` attribute depending on the `/fp` option and `/Qfast-transcendentals` settings. In `/fp:fast` mode, or if fast but less accurate math functions are explicitly enabled by `/Qfast-transcendentals-`, then the compiler sets a `max-error=`*4.0* for the call. Otherwise, it sets a `max-error=`*0.6*.

Dispatching of Math Routines

The compiler optimizes calls to routines from the *libm* and *svml* libraries into direct CPU-specific calls, when the compilation configuration specifies the target CPU where the code is tuned, and if the set of instructions available for the code compilation is not narrower than the set of instructions available in the tuning target CPU.

For example:

- The code containing calls to the *exp()* library function and compiled with `-mtune=`*`corei7-avx`* (specifies tuning target CPU that supports Intel® Advanced Vector Extensions (Intel® AVX)) and `-QxCORE-AVX2/-march=`*`core-avx2`* (specifies Intel® Advanced Vector Extensions 2 (Intel® AVX2) instructions set) call the *exp()* routine that is optimized for processors with Intel® AVX support. This code provides the best performance for these processors.
- The same code, compiled with `-mtune=`*`core-avx2`* and `-QxAVX/-march=`*`corei7-avx`*, calls a library dispatch routine that picks the optimal CPU specific version of the *exp()* routine in runtime. Dispatching cannot be avoided because the instruction set does not allow the use of Intel® AVX2. Dynamic dispatching provides the best performance with the Intel® AVX2 CPU.

In the second example, if some portions of code extend the available instructions set by means of the `_allow_cpu_features()` or the `_may_i_use_cpu_feature()` intrinsic, then the compiler might produce direct calls to Intel® AVX2 specific versions of *exp()*.

The dispatching optimization applies to the *exp()* routine, and to the other math routines with CPU specific implementations in the libraries. The dispatching optimization can be disabled using the `-fimf-force-dynamic-target` (or `Qimf-force-dynamic-target`) option. This option specifies a list of math routines that are improved with a dynamic dispatcher.

fimf-max-error, Qimf-max-error compiler option

Floating-point Optimizations

Application performance is an important goal of the Intel® C++ Compiler, even at default optimization levels. A number of optimizations involve transformations that might affect the floating-point behavior of the application, such as evaluation of constant expressions at compile time, hoisting invariant expressions out of loops, or changes in the order of evaluation of expressions. These optimizations usually help the compiler to produce the most efficient code possible. However, the optimizations might be contrary to the floating-point requirements of the application.

Some optimizations are not consistent with strict interpretation of the ANSI or ISO standards for C and C++. Such optimizations can cause differences in rounding and small variations in floating-point results that may be more or less accurate than the ANSI-conformant result.

The Intel® C++ Compiler provides the `-fp-model` (Linux* and macOS) or `/fp` (Windows*) option, which allows you to control the optimizations performed when you build an application. The option allows you to specify the compiler rules for:

- **Value safety:** Whether the compiler may perform transformations that could affect the result. For example, in the SAFE mode, the compiler won't transform `x/x` to 1.0 because the value of `x` at runtime might be a zero or a NaN . The UNSAFE mode is the default.
- **Floating-point expression evaluation:** How the compiler should handle the rounding of intermediate expressions. For example, when double precision is specified, the compiler interprets the statement `t0=4.0f+0.1f+t1+t2;` as `t0=(float)(4.1+(double)t1+(double)t2);`
- **Floating-point contractions:** Whether the compiler should generate fused multiply-add (FMA) instructions on processors that support them. When enabled, the compiler may generate FMA instructions for combining multiply and add operations; when disabled, the compiler must generate separate multiply and add instructions with intermediate rounding.
- **Floating-point environment access:** Whether the compiler must account for the possibility that the program might access the floating-point environment, either by changing the default floating-point control settings or by reading the floating-point status flags. This is disabled by default. You can use the `-fp-model:strict` (Linux* and macOS) `/fp:strict` (Windows*) option to enable it.
- **Precise floating-point exceptions:** Whether the compiler should account for the possibility that floating-point operations might produce an exception. This is disabled by default. You can use `-fp-model:strict` (Linux* and macOS) or `/fp:strict` (Windows*); or `-fp-model:except` (Linux* and macOS) or `/fp:except` (Windows*) to enable it.

Consider the following example:

```
double a=1.5; int x=0; ...
  __try {
    int t0=a; //raises inexact
    x=1;
    a*=2;
  } __except(1) {
  printf("SEH Exception: x=%d\n", x);
}
```

Without precise floating-point exceptions, the result is `SEH Exception: x=1`; with precision floating-point exceptions, the result is `SEH Exception: x=0`.

The following table describes the impact of different keywords of the option on compiler rules and optimizations:

Keyword	Value Safety	Floating-Point Expression Evaluation	Floating-Point Contractions	Floating-Point Environment Access	Precise Floating-Point Exceptions

`precise`
`source`
`double`
`extended`
	Safe	Varies
		Source
		Double
		Extended
			Yes	No	No

`strict`	Safe	Varies	No	Yes	Yes
`consistent`	Safe	Varies	No	No	No
`fast=1` (default)	Unsafe	Unknown	Yes	No	No
`fast=2`	Very unsafe	Unknown	Yes	No	No
`except` `except-`	Unaffected Unaffected	Unaffected Unaffected	Unaffected Unaffected	Unaffected Unaffected	Yes No

NOTE
It is illegal to specify the `except` keyword in an unsafe safety mode.

Based on the objectives of an application, you can choose to use different sets of compiler options and keywords to enable or disable certain optimizations, so that you can get the desired result.

Using -fp-model (/fp) Option

Use the -fp-model, /fp Option

The `-fp-model` (Linux and macOS) or `/fp` (Windows) option allows you to control the optimizations on floating-point data. You can use this option to tune the performance, level of accuracy, or result consistency for floating-point applications across platforms and optimization levels.

For applications that do not require support for denormalized numbers, the `-fp-model` or `/fp` option can be combined with the `[Q]ftz` option to flush denormalized results to zero. This flush can improve runtime performance on processors based on all Intel® architectures.

You can use keywords to specify the semantics to be used. The keywords specified for this option may influence the choice of math routines that are invoked. Many routines in the *libirc*, *libm*, and *libsvml* libraries are more highly optimized for Intel microprocessors than for non-Intel microprocessors. Possible values of the keywords are as follows:

Keyword	Description
`precise`	Enables value-safe optimizations on floating-point data.
`fast[=1|2]`	Enables more aggressive optimizations on floating-point data.
`consistent`	Enables consistent, reproducible results for different optimization levels or between different processors of the same architecture. This setting is equivalent to the use of the following options: Windows: `/fp:precise /Qfma- /Qimf-arch-consistency:true` Linux and macOS: `-fp-model precise -no-fma -fimf-arch-consistency=true`
`strict`	Enables `precise` and `except` , disables contractions, and enables pragma `stdc fenv_access`.
`source`	Rounds intermediate results to source-defined precision and enables value-safe optimizations.
`double`	Rounds intermediate results to 53-bit (double) precision and enables value-safe optimizations.
`extended`	Rounds intermediate results to 64-bit (extended) precision and enables value-safe optimizations.
`[no-]except` (Linux and macOS) or `except[-]` (Windows)	Determines whether strict floating-point exception semantics are used.

The default value of the option is `-fp-model fast=1` or `/fp:fast=1`, which means that the compiler uses more aggressive optimizations on floating-point calculations.

NOTE
Using the default option keyword `-fp-model fast` or `/fp:fast`, you may get significant differences in your result depending on whether the compiler uses x87 or Intel® Streaming SIMD Extensions (Intel® SSE)/Intel® Advanced Vector Extensions (Intel® AVX) instructions to implement floating-point operations. Results are more consistent when the other option keywords are used.

Several examples are provided to illustrate the usage of the keywords. These examples show:

- A small example of source code.

NOTE
The same source code is considered in all the included examples.

- The semantics that are used to interpret floating-point calculations in the source code.
- One or more possible ways the compiler may interpret the source code.

NOTE
There are several ways that the compiler may interpret the code; we show just some of these possibilities.

-fp-model fast or /fp:fast

Example source code:

Example

```
float t0, t1, t2;
...
t0 = 4.0f + 0.1f + t1 + t2;
```

When this option is specified, the compiler applies the following semantics:

- Additions may be performed in any order.
- Intermediate expressions may use `single`, `double`, or `extended double` precision.
- The constant addition may be pre-computed, assuming the default rounding mode.

Using these semantics, some possible ways the compiler may interpret the original code are given below:

Example

```
float t0, t1, t2;
  ...
t0 = (float)((double)t1 + (double)t2) + 4.1f;
```

```
float t0, t1, t2;
  ...
t0 = (t1 + t2) + 4.1f;
```

```
float t0, t1, t2;
  ...
t0 = (t1 + 4.1f) + t2;
```

-fp-model extended or /fp:extended

This setting is equivalent to `-fp-model precise` on Linux operating systems based on the IA-32 architecture.

Example source code:

```
float t0, t1, t2;
  ...
t0 = 4.0f + 0.1f + t1 + t2;
```

When this option is specified, the compiler applies the following semantics:

- Additions are performed in program order
- Intermediate expressions use extended double precision
- The constant addition may be pre-computed, assuming the default rounding mode

Using these semantics, a possible way the compiler may interpret the original code is shown below:

```
float t0, t1, t2;
  ...
t0 = (float)(((long double)4.1 + (long double)t1) + (long double)t2);
```

-fp-model source or /fp:source

This setting is equivalent to `-fp-model precise` or `/fp:precise` on systems based on the Intel® 64 architecture.

Source code example

```
float t0, t1, t2;
...
t0 = 4.0f + 0.1f + t1 + t2;
```

When this option is specified, the compiler applies the following semantics:

- Additions are performed in program order.
- Intermediate expressions use the precision specified in the source code, that is, single precision.
- The constant addition may be pre-computed, assuming the default rounding mode.

Using these semantics, a possible way the compiler may interpret the original code is shown below:

Example

```
float t0, t1, t2;
  ...
t0 = ((4.1f + t1) + t2);
```

-fp-model double or /fp:double

This setting is equivalent to `-fp-model precise` or `/fp:precise` on Windows systems based on the IA-32 architecture.

Example source code:

```
float t0, t1, t2;
  ...
t0 = 4.0f + 0.1f + t1 + t2;
```

When this option is specified, the compiler applies the following semantics:

- Additions are performed in program order
- Intermediate expressions use double precision
- The constant addition may be pre-computed, assuming the default rounding mode

Using these semantics, a possible way the compiler may interpret the original code is shown below:

```
float t0, t1, t2;
  ...
t0 = (float)(((double)4.1 + (double)t1) + (double)t
```

-fp-model strict or /fp:strict

Source code example

```
float t0, t1, t2;
  ...
t0 = 4.0f + 0.1f + t1 + t2;
```

When this option is specified, the compiler applies the following semantics:

- Additions are performed in program order
- Expression evaluation matches expression evaluation under keyword `precise`.
- The constant addition is not pre-computed because there is no way to tell what rounding mode will be active when the program runs.

Using these semantics, a possible way the compiler may interpret the original code is shown below:

Example

```
float t0, t1, t2;
  ...
t0 = (float)((((long double)4.0f + (long double)0.1f) + (long double)t1) + (long double)t2);
```

Denormal Numbers

A normalized number is a number for which both the exponent (including bias) and the most significant bit of the mantissa are non-zero. For such numbers, all the bits of the mantissa contribute to the precision of the representation.

The smallest normalized single-precision floating-point number greater than zero is about 1.1754943^{-38}. Smaller numbers are possible, but those numbers must be represented with a zero exponent and a mantissa whose leading bit(s) are zero, which leads to a loss of precision. These numbers are called denormalized numbers or denormals(newer specifications refer to these as subnormal numbers).

Denormal computations use hardware and/or operating system resources to handle denormals; these can cost hundreds of clock cycles. Denormal computations take much longer to calculate than normal computations.

There are several ways to avoid denormals and increase the performance of your application:

- Scale the values into the normalized range.
- Use a higher precision data type with a larger range.
- Flush denormals to zero.

Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1: Basic Architecture

Institute of Electrical and Electronics Engineers, Inc*. (IEEE) web site for information about the current floating-point standards and recommendations

Floating-Point Environment

The floating-point environment is a collection of registers that control the behavior of the floating-point machine instructions and indicate the current floating-point status. The floating-point environment can include rounding mode controls, exception masks, flush-to-zero (`FTZ`) controls, exception status flags, and other floating-point related features.

For example, bit 15 of the `MXCSR` register enables the flush-to-zero mode, which controls the masked response to an single-instruction multiple-data (SIMD) floating-point underflow condition.

The floating-point environment affects most floating-point operations; therefore, correct configuration to meet your specific needs is important. For example, the exception mask bits define which exceptional conditions will be raised as exceptions by the processor. In general, the default floating-point environment is set by the operating system. You don't need to configure the floating-point environment unless the default floating-point environment does not suit your needs.

There are several methods available if you want to modify the default floating-point environment. For example, you can use inline assembly, compiler built-in functions, library functions, or command line options.

Changing the default floating-point environment affects runtime results only. This does not affect any calculations that are pre-computed at compile time.

If strict reproducibility and consistency are important do not change the floating point environment without also using either `-fp-model strict` (Linux* or macOS) or `/fp:strict` (Windows*) option or `pragma fenv_access`.

Set the FTZ and DAZ Flags

In Intel® processors, the flush-to-zero (`FTZ`) and denormals-are-zero (`DAZ`) flags in the `MXCSR` register are used to control floating-point calculations. Intel® Streaming SIMD Extensions (Intel® SSE) and Intel® Advanced Vector Extensions (Intel® AVX) instructions, including scalar and vector instructions, benefit from enabling the `FTZ` and `DAZ` flags. Floating-point computations using the Intel® SSE and Intel® AVX instructions are accelerated when the `FTZ` and `DAZ` flags are enabled. This improves the application's performance.

Use the `[Q]ftz` option to flush denormal results to zero when the application is in the gradual underflow mode. This option may improve performance if the denormal values are not critical to the application's behavior. The `[Q]ftz` option, when applied to the main program, sets the `FTZ` and the `DAZ` hardware flags. The negative forms of the `[Q]ftz` option (`-no-ftz` for Linux* and macOS*, and `/Qftz-` for Windows*) leave the flags as they are.

The following table describes how the compiler processes denormal values based on the status of the `FTZ` and `DAZ` flags:

Flag	When set to ON, the compiler...	When set to OFF, the compiler...	Supported on
`FTZ`	...sets denormal results from floating-point calculations to zero.	...does not change the denormal results.	Intel® 64 and some IA-32 architectures
`DAZ`	...treats denormal values used as input to floating-point instructions as zero.	...does not change the denormal instruction inputs.	Intel® 64 and some IA-32 architectures

- `FTZ` and `DAZ` are not supported on all IA-32 architectures. The `FTZ` flag is supported only on IA-32 architectures that support Intel® SSE instructions.
- On systems based on the IA-32 and Intel® 64 architectures, `FTZ` only applies to Intel® SSE and Intel® AVX instructions. If the application generates denormals using x87 instructions, `FTZ` does not apply.
- `DAZ` and `FTZ` flags are not compatible with the IEEE 754 standard, and should only be enabled when compliance to the IEEE standard is not required.

Options for `[Q]ftz` are performance options. Setting these options does not guarantee that all denormals in a program are flushed to zero. They only cause denormals generated at run-time to be flushed to zero.

On Intel® 64 and IA-32 systems, the compiler, by default, inserts code into the main routine to set the `FTZ` and `DAZ` flags. When the `[Q]ftz` option is used on IA-32 systems with the option `-msse2` or `/arch:sse2`, the compiler inserts code to that conditionally sets the `FTZ`/`DAZ` flags based on a run-time processor check. Using the negative form of `[Q]ftz` prevents the compiler from inserting any code that sets `FTZ` or `DAZ` flags.

When the `[Q]ftz` option is used in combination with an Intel® SSE-enabling option on systems based on the IA-32 architecture (for example, `-msse2` or `/arch:sse2`), the compiler inserts code in the main routine to set `FTZ` and `DAZ`. When the option `[Q]ftz` is used without an Intel® SSE-enabling option, the compiler inserts code that conditionally sets `FTZ` or `DAZ` based on a run-time processor check. The negative form of `[Q]ftz` prevents the compiler from inserting any code that might set `FTZ` or `DAZ`.

The `[Q]ftz` option only has an effect when the main program is being compiled. It sets the `FTZ`/`DAZ` mode for the process. The initial thread, and any subsequently created threads, operate in the `FTZ`/`DAZ` mode.

On systems based on Intel® 64 and IA-32 architectures, every optimization option `O` level, except `O0`, sets `[Q]ftz`.

If this option produces undesirable results of the numerical behavior of the program, turn the `FTZ`/`DAZ` mode off by using the negative form of `[Q]ftz` in the command line while still benefitting from the `O3` optimizations.

Manually set the `FTZ` flags with the following macros:

```
_MM_SET_FLUSH_ZERO_MODE(_MM_FLUSH_ZERO_ON)
```

Manually set the `DAZ` flags with the following macros:

```
_MM_SET_DENORMALS_ZERO_MODE(_MM_DENORMALS_ZERO_ON)
```

The prototypes for these macros are in `xmmintrin.h` (`FTZ`) and `pmmintrin.h` (`DAZ`).

Checking the Floating-point Stack State

On systems based on the IA-32 architecture, when an application calls a function that returns a floating-point value, the returned floating-point value is supposed to be on the top of the floating-point stack. If the return value is not used, the compiler must pop the value off of the floating-point stack in order to keep the floating-point stack in the correct state.

On systems based on Intel® 64 architecture, floating-point values are usually returned in the `xmm0` register. The floating-point stack is used only when the return value is a long double on Linux* and macOS systems.

If the application calls a function without defining or incorrectly defining the function's prototype, the compiler cannot determine if the function must return a floating-point value. Consequently, the return value is not popped off the floating-point stack if it is not used. This can cause the floating-point stack to overflow.

The overflow of the stack results in two undesirable situations:

- A `NaN` value gets involved in the floating-point calculations
- The program results become unpredictable; the point where the program starts making errors can be arbitrarily far away from the point of the actual error.

For systems based on the IA-32 and Intel® 64 architectures, the [Q]fp-stack-check option checks whether a program makes a correct call to a function that should return a floating-point value. If an incorrect call is detected, the option places a code that marks the incorrect call in the program. The [Q]fp-stack-check option marks the incorrect call and makes it easy to find the error.

> **NOTE**
> The [Q]fp-stack-check option causes significant code generation after every function/subroutine call to ensure that the floating-point stack is maintained in the correct state. Therefore, using this option slows down the program being compiled. Use the option only as a debugging aid to find floating point stack underflow/overflow problems, which can be otherwise hard to find.

Tuning Performance

This section describes several programming guidelines that can help you improve the performance of floating-point applications, including:

- Handling Floating-point Array Operations in a Loop Body
- Reducing the Impact of Denormal Exceptions
- Avoiding Mixed Data Type Arithmetic Expressions

- Using Efficient Data Types

Handling Floating-point Array Operations in a Loop Body

Following the guidelines below will help auto-vectorization of the loop.

- Statements within the loop body may contain float or double operations (typically on arrays). The following arithmetic operations are supported: addition, subtraction, multiplication, division, negation, square root, MAX, MIN, and mathematical functions such as SIN and COS.
- Writing to a single-precision scalar/array and a double scalar/array within the same loop decreases the chance of auto-vectorization due to the differences in the vector length (that is, the number of elements in the vector register) between float and double types. If auto-vectorization fails, try to avoid using mixed data types.

> **NOTE**
> The special `__m64`, `__m128`, and `__m256` datatypes are not vectorizable. The loop body cannot contain any function calls. Use of the Intel® Streaming SIMD Extensions (Intel® SSE) and Intel® Advanced Vector Extensions (Intel® AVX) intrinsics (for example, `mm_add_ps`) is not allowed.

Reducing the Impact of Denormal Exceptions

Denormalized floating-point values are those that are too small to be represented in the normal manner; that is, the mantissa cannot be left-justified. Denormal values require hardware or operating system interventions to handle the computation, so floating-point computations that result in denormal values may have an adverse impact on performance.

There are several ways to handle denormals to increase the performance of your application:

- Scale the values into the normalized range
- Use a higher precision data type with a larger range
- Flush denormals to zero

For example, you can translate them to normalized numbers by multiplying them using a large scalar number, doing the remaining computations in the normal space, then scaling back down to the denormal range. Consider using this method when the small denormal values benefit the program design.

Consider using a higher precision data type with a larger range; for example, by converting variables declared as `float` to be declared as `double`. Understand that making the change can potentially slow down your program. Storage requirements will increase, which will increase the amount of time for loading and storing data from memory. Higher precision data types can also decrease the potential throughput of Intel® Streaming SIMD Extensions (Intel® SSE) and Intel® Advanced Vector Extensions (Intel® AVX) operations.

If you change the type declaration of a variable, you might also need to change associated library calls, unless these are generic; ; for example, `cos()` instead of `cosf()`.. Another strategy that might result in increased performance is to increase the amount of precision of intermediate values using the `-fp-model [double|extended]` option. However, this strategy might not eliminate all denormal exceptions, so you must experiment with the performance of your application. You should verify that the gain in performance from eliminating denormals is greater than the overhead of using a data type with higher precision and greater dynamic range.

In many cases, denormal numbers can be treated safely as zero without adverse effects on program results. Depending on the target architecture, use flush-to-zero (`FTZ`) options.

IA-32 and Intel® 64 Architectures

IA-32 and Intel® 64 architectures take advantage of the `FTZ` (flush-to-zero) and `DAZ` (denormals-are-zero) capabilities of Intel® Streaming SIMD Extensions (Intel® SSE) instructions.

By default, the Intel® C++ Compiler inserts code into the main routine to enable `FTZ` and `DAZ` at optimization levels higher than `O0`. To enable `FTZ` and `DAZ` at `O0`, compile the source file containing main() PROGRAM using compiler option `[Q]ftz`. When the `[Q]ftz` option is used on IA-32-based systems with the option `-mia32` (Linux*) or `/arch:IA32` (Windows*), the compiler inserts code to conditionally enable `FTZ` and `DAZ` flags based on a run-time processor check. IA-32 is not available on macOS*.

NOTE
After using flush-to-zero, ensure that your program still gives correct results when treating denormal values as zero.

Avoiding Mixed Data Type Arithmetic Expressions

Avoid mixing integer and floating-point (float, double, or long double) data in the same computation. Expressing all numbers in a floating-point arithmetic expression (assignment statement) as floating-point values eliminates the need to convert data between fixed and floating-point formats. Expressing all numbers in an integer arithmetic expression as integer values also achieves this. This improves run-time performance.

For example, assuming that `I` and `J` are both int variables, expressing a constant number (2.0) as an integer value (2) eliminates the need to convert the data. The following examples demonstrate inefficient and efficient code.

Inefficient code:

```
int I, J;
  I = J / 2.0
;
```

Efficient code:

```
int I, J;
  I = J / 2;
```

Using Efficient Data Types

In cases where more than one data type can be used for a variable, consider selecting the data types based on the following hierarchy, listed from most to least efficient:

- char
- short
- int
- long
- long long
- float
- double
- long double

NOTE
In an arithmetic expression, you should avoid mixing integer and floating-point data.

You can use integer data types (*int*, *int long*, etc.) in loops to improve floating point performance. Convert the data type to integer data types, process the data, then convert the data to the old type.

IEEE Floating-point Operations

Understanding the IEEE Standard for Floating-point Arithmetic, IEEE 754-2008

This version of the compiler uses a close approximation to the IEEE Standard for Floating-point Arithmetic, version IEEE 754-2008, unless otherwise stated. This standard is common to many microcomputer-based systems due to the availability of fast processors that implement the required characteristics.

This section outlines the characteristics of the IEEE 754-2008 standard and its implementation in the compiler. Except as noted, the description refers to both the IEEE 754-2008 standard and the compiler implementation.

Floating-point Formats

This IEEE 754-2008 standard specifies formats and methods for Floating-point representation in computer systems, and recommends formats for data interchange. The exception conditions are defined, and the standard handling of these conditions is specified below. The binary counterpart Floating-point exception functions are described in ISO C99. The decimal Floating-point exception functions are defined in the `fenv.h` header file. The compiler supports decimal floating point types in C and C++. The decimal floating point formats are defined in the IEEE 754-2008 standard.

In C, these decimal floating types are supported:

- `_Decimal32`
- `_Decimal64`
- `_Decimal128`

In C++ for Windows and Linux, these decimal classes are supported:

- `decimal32`
- `decimal64`
- `decimal128`

NOTE To use this feature in C++ on Linux, GCC 4.5 or later is required.

The decimal Floating-point is not supported in C++ for macOS.

To ensure correct decimal Floating-point behavior, you must define `__STDC_WANT_DEC_FP__` before any standard headers are included. This is required for the declaration of decimal macros and library functions in order to ensure correct decimal Floating-point results at run-time.

Example: Linux

```
#include <iostream>
#define __STDC_WANT_DEC_FP__
#include <decimal/decimal>
typedef std::decimal::decimal32 _Decimal32;
typedef std::decimal::decimal64 _Decimal64;
typedef std::decimal::decimal128 _Decimal128;
#include <dfp754.h>

using namespace std;
using namespace std::decimal;

int main() {
```

```
    std::decimal::decimal32 d = 4.7df;
    std::cout << decimal_to_long_double(d) << std::endl;
    return 0;
}
```

Example: Windows

```
#include <iostream>
#define __STDC_WANT_DEC_FP__
#include <decimal>
#include <dfp754.h>

using namespace std;
using namespace std::decimal;

int main() {
    std::decimal::decimal32 d = 4.7df;
    std::cout << decimal_to_long_double(d) << std::endl;
    return 0;
}
```

Functions to Check Decimal Floating-point Status

Use these Floating-point exception functions to detect exceptions that occur during decimal Floating-point arithmetic:

Floating-point Functions

Function	Brief Description
`fe_dec_feclearexcept()`	Clears the supported Floating-point exceptions.
`fe_dec_fegetexceptflag`	Stores an implementation-defined representation of the states of the Floating-point status flags.
`fe_dec_feraiseexcept`	Raises the supported Floating-point exceptions.
`fe_dec_fesetexceptflag`	Sets the Floating-point status flags.
`fe_dec_fetestexcept()`	Determines which of a specified subset of the floating point exception flags are currently set.

Special Values

The following list provides a brief description of the special values that the Intel® C++ Compiler supports.

- **Signed Zero:** The sign of zero is the same as the sign of a nonzero number. Comparisons consider +0 to be equal to -0. A signed zero is useful in certain numerical analysis algorithms, but in most applications the sign of zero is invisible.
- **Denormalized Numbers:** Denormalized numbers (denormals) fill the gap between the smallest positive and the smallest negative normalized number, otherwise only (+/-) 0 occurs in the interval. Denormalized numbers extend the range of computable results by allowing for gradual underflow.

  Systems based on the IA-32 architecture support a Denormal Operand status flag. When this is set, at least one of the input operands to a Floating-point operation is a denormal. The Underflow status flag is set when a number loses precision and becomes a denormal.
- **Signed Infinity:** Infinities are the result of arithmetic in the limiting case of operands with arbitrarily large magnitude. They provide a way to continue when an overflow occurs. The sign of an infinity is simply the sign you obtain for a finite number in the same operation as the finite number approaches an infinite value.

By retrieving the status flags, you can differentiate between an infinity that results from an overflow and one that results from division by zero. The compiler treats infinity as signed by default. The output value of infinity is +Infinity or -Infinity.

- **Not a Number:** Not a Number (NaN) may result from an invalid operation. For example, `0/0` and `SQRT(-1)` result in NaN. In general, an operation involving a NaN produces another NaN. Because the fraction of a NaN is unspecified, there are many possible NaNs

  The compiler treats all NaNs identically, but there are two classes of NaNs:

  - Signaling NaNs: Have an initial mantissa bit of 0. They usually raise an invalid exception when used in an operation.
  - Quiet NaNs: Have an initial mantissa bit of 1.

  The floating-point hardware usually converts a signaling NaN into a quiet NaN during computational operations. An invalid exception is raised and the resulting Floating-point value is a quiet NaN.

Attributes

Attributes are a way to provide additional information about a declaration to the compiler. The C+11 attribute syntax is consistent with the C2x standard.

Use Attributes

The compiler supports three ways to add attributes to your program:

- **Gnu Syntax**

```
__attribute__((attribute_name(arguments)))
```

- **Microsoft Syntax**

```
__declspec(attribute_name(argument))
```

- **C++11 Standardized Attribute Syntax** (part of the C++11 language standard)

```
[[attribute_name(arguments)]]
```

```
[[attribute-namespace :: attribute_name(arguments)]]
```

Some attributes are available for both Intel® microprocessors and non-Intel microprocessors but they may perform additional optimizations for Intel® microprocessors than they perform for non-Intel microprocessors. Refer to the individual attribute name for a detailed description.

align

Directs the compiler to align the variable to a specified boundary and a specified offset.

Syntax

Windows* OS:

`__declspec(align(n[,off]))`

Linux* OS:

`__attribute__((aligned(n[,off])))`

`__attribute__((align(n[,off])))`

For portability on Linux* OS, you should use the syntax form `__attribute__((aligned(n[, off])))`. This form is compatible with the GNU compiler.

Arguments

n	Specifies the alignment. The compiler will align the variable to an *n*-byte boundary.
off	Optional. Specifies the offset. If this argument is omitted, the value is 0.

Description

This keyword directs the compiler to align the variable to an *n*-byte boundary with offset *off* within each *n*-byte boundary. The address of the variable is `address mod n=off`.

> **NOTE**
> If you require 8-byte alignment, we recommend you specify 16 for *n*, instead of 8. When 8 is used, the compiler interprets the value as a suggestion and you may not get the requested 8-byte alignment, depending on various heuristics.

align_value

Provides the ability to add a pointer alignment value to a pointer typedef declaration.

Syntax

Windows* OS:

```
__declspec(align_value(alignment))
```

Linux* OS:

```
__attribute__((align_value(alignment)))
```

Arguments

alignment	Specifies the alignment (8, 16, 32, 64, 128, 256,...) for what the pointer points to.

Description

This keyword can be added to a pointer typedef declaration to specify the alignment value of pointers declared for that pointer type.

This indicates to the compiler that the data referenced by the designated pointer is aligned by the indicated value, and the compiler can generate code based on that assumption. If this attribute is used incorrectly, and the data is not aligned to the designated value, the behavior is undefined.

avoid_false_share

Provides the ability to pad and/or align the defined variable such that it will not be subject to false cache line sharing with any other variable.

Syntax

Windows* OS:

```
__declspec(avoid_false_share(identifier))variable definition
```

Linux* OS:

`__attribute__((avoid_false_share(identifier)))variable definition`

Arguments

identifier	Specifies the string that will be used to identify one or more variables. Variables with the same identifier do not need protection from false sharing.
variable definition	Specifies the variable to be padded or aligned.

Description

This keyword indicates to the compiler that it should allocate the *variable* through padding and/or alignment such that it will not share the cache line with other variables unless they share the same *identifier*. This keyword must occur on a *variable definition* in function, global, or namespace scope. It is not permitted on a non-static class member or on a function argument.

If you specify an *identifier*, the *variable definition* does not need to be protected from false sharing with other variables that are similarly declared with the same identifier. If the *variable definition* is in function scope, the scope of the *identifier* is the current function. If the *variable definition* is in namespace or global scope, the scope of the *identifier* is the current compilation unit.

This keyword is supported for scalars and arrays and is not supported for structure fields, function arguments, functions, and references.

code_align

Specifies the byte alignment for a routine.

Syntax

Windows* OS:

`__declspec(code_align(n))`

Linux* OS, macOS:

`__attribute__((code_align(n)))`

Arguments

n	Optional. A positive integer indicating the number of bytes for the minimum desired alignment boundary. Its value must be a power of 2, between 1 and 4096, such as 1, 2, 4, 8, and so on. If you specify 1 for *n*, no alignment is performed. If you do not specify *n*, the default alignment is 16 bytes.

Description

This keyword must be placed on the routine to be aligned.

If anything inside the routine requires specific alignment *k*, the final routine alignment will be *max(n,k)*.

cpu_dispatch, cpu_specific attribute
Processor Targeting

concurrency_safe

Guides the compiler to parallelize more loops and straight-line code.

Syntax

Windows* OS:

`__declspec(concurrency_safe(clause))`

Linux* OS:

`__attribute__((concurrency_safe(clause)))`

Arguments

clause	Is one of the following: *cost(cycles)*: Specifies the execution cycles of the annotated function for the compiler to perform parallelization profitability analysis while compiling its enclosing loops or blocks. The value of `cycles` is a 2-byte unsigned integer (unsigned short); its maximal value is 2^16-1. If the cycle count is greater than 2^16-1, you should use *profitable*. *profitable*: Specifies that the loops or blocks that contain calls to the annotated function are profitable to parallelize.

Description

This keyword indicates to the compiler that there are no incorrect side-effects and no illegal (or improperly synchronized) memory access interferences among multiple invocations of the annotated function or between an invocation of this annotated function and other statements in the program, if they are executed concurrently.

For every function that is marked with this keyword, you must ensure that its side effects (if any) are acceptable (or expected), and the memory access interferences are properly synchronized.

const

Indicates that a function has no effect other than returning a value and that it uses only its arguments to generate that return value.

Syntax

Windows* OS:

`__declspec(const)`

Linux* OS:

`__attribute__((const))`

Arguments

None

Description

This keyword is equivalent to the gcc* attribute `const` and applies to function declarations.

cpu_dispatch, cpu_specific

Provides the ability to write one or more versions of a function that execute only on a list of targeted processors (cpu_dispatch). Provides the ability to declare that a version of a function is targeted at particular type(s) of processors (cpu_specific).

Syntax

Windows* OS:

`__declspec(cpu_dispatch(`*`cpuid, cpuid, ...`*`))`

`__declspec(cpu_specific(`*`cpuid`*`))`

Linux* OS:

`__attribute__((cpu_dispatch(`*`cpuid, cpuid, ...`*`)))`

`__attribute__((cpu_specific(`*`cpuid`*`)))`

Arguments

cpuid	Possible values are: `atom`: Intel® Atom™ processors with Intel® Supplemental Streaming SIMD Extensions 3 (Intel® SSSE3) `atom_sse4_2`: Intel® Atom™ processors with Intel® Streaming SIMD Extensions 4.2 (Intel® SSE4.2) `atom_sse4_2_movbe`: Intel® Atom™ processors with Intel® Streaming SIMD Extensions 4.2 (Intel® SSE4.2) with MOVBE instructions enabled `broadwell`: This is a synonym for `core_5th_gen_avx` `core_2nd_gen_avx`: 2nd generation Intel® Core™ processor family with support for Intel® Advanced Vector Extensions (Intel® AVX) `core_3rd_gen_avx`: 3rd generation Intel® Core™ processor family with support for Intel® Advanced Vector Extensions (Intel® AVX) including the RDRND instruction `core_4th_gen_avx`: 4th generation Intel® Core™ processor family with support for Intel® Advanced Vector Extensions 2 (Intel® AVX2) including the RDRND instruction

`core_4th_gen_avx_tsx`: 4th generation Intel® Core™ processor family with support for Intel® Advanced Vector Extensions 2 (Intel® AVX2) including the RDRND instruction, and support for Intel® Transactional Synchronization Extensions (Intel® TSX)

`core_5th_gen_avx`: 5th generation Intel® Core™ processor family with support for Intel® Advanced Vector Extensions 2 (Intel® AVX2) including the RDSEED and Multi-Precision Add-Carry Instruction Extensions (ADX) instructions

`core_5th_gen_avx_tsx`: 5th generation Intel® Core™ processor family with support for Intel® Advanced Vector Extensions 2 (Intel® AVX2) including the RDSEED and Multi-Precision Add-Carry Instruction Extensions (ADX) instructions, and support for Intel® Transactional Synchronization Extensions (Intel® TSX)

`core_aes_pclmulqdq`: Intel® Core™ processors with support for Advanced Encryption Standard (AES) instructions and carry-less multiplication instruction

`core_i7_sse4_2`: Intel® Core™ i7 processors with Intel® Streaming SIMD Extensions 4.2 (Intel® SSE4.2) instructions

`generic`: Other Intel processors for IA-32 or Intel® 64 architecture or compatible processors not provided by Intel Corporation

`haswell`: This is a synonym for `core_4th_gen_avx`

`pentium`: Intel® Pentium® processor

`pentium_4`: Intel® Pentium® 4 processors

`pentium_4_sse3`: Intel® Pentium® 4 processor with Intel® Streaming SIMD Extensions 3 (Intel® SSE3) instructions, Intel® Core™ Duo processors, Intel® Core™ Solo processors

`pentium_ii`: Intel® Pentium® II processors

`pentium_iii`: Intel® Pentium® III processors

`pentium_iii_no_xmm_regs`: Intel® Pentium® III processors with no XMM registers

`pentium_m`: Intel® Pentium® M processors

`pentium_mmx`: Intel® Pentium® processors with MMX™ technology

`pentium_pro`: Intel® Pentium® Pro processors

Description

Use the cpu_dispatch keyword to provide a list of targeted processors, along with an empty function body/ function stub.

Use the cpu_specific keyword to declare each function version targeted at particular type(s) of processors

These feature are available only for Intel processors based on IA-32 or Intel® 64 architecture. They are not available for non-Intel processors. Applications built using the manual processor dispatch feature may be more highly optimized for Intel processors than for non-Intel processors.

Processor Targeting

mpx

Directs the compiler to pass Intel® Memory Protection Extensions (Intel® MPX) bounds information along with any pointer-typed parameters.

Syntax

Windows* OS:

`__declspec(mpx)`

Arguments

None

Description

When a function declared with this keyword is called, any pointer-typed parameters passed to the function will also have Intel® MPX bounds information passed. If the called function returns a pointer-typed object, the compiler will expect the function to return Intel® MPX bounds information along with the pointer object. Similarly, if this keyword is applied to a function definition, the function will expect the caller to pass Intel® MPX bounds information along with any pointer-type parameters. If the function returns a pointer-typed object, Intel® MPX bounds information will be returned with the object.

> **NOTE**
> The usage of this attribute is intended for Windows code that contains hand-written Intel® MPX enhancements based on Intel® MPX inline assembly or calls to Intel® MPX intrinsics, and where the user does not wish to enable automatic Intel® MPX code generation.

target

Specifies a target for called functions or variables.

Syntax

Windows* OS:

`__declspec(target(`*`target-name`*`))`

Linux* OS:

`__attribute__((target(`*`target-name`*`)))`

Arguments

target-name	Specifies the target name. Possible values are: • arch=corei7 • arch=core2 • arch=atom • mmx • sse • sse2 • sse3 • ssse3

- `sse4`
- `sse4a`
- `sse4.1`
- `sse4.2`
- `popcnt`
- `aes`
- `pclmul`
- `avx`
- `avx2`
- `avx512f`

Description

This keyword specifies that the called function or variable is also available on the target. Only functions or variables marked with this attribute are available on the target, and only these functions can be called on the target.

vector

Provides the ability to vectorize user-defined functions and loops.

Syntax

Windows* OS:

`__declspec(vector(`*`clauses`*`))`

Linux* OS:

`__attribute__((vector(`*`clauses`*`)))`

Arguments

`clauses`	Is one of the following: `processor clause`, in the form *processor(cpuid)*. This clause creates a vector version of the function for the given target processor (*cpuid*). See cpu_dispatch, cpu_specific for a list of supported values. The default processor is determined by the implicit or explicit process- or architecture-specific flag in the compiler command line. `vector length clause`, in the form *vectorlength(n)*, where *n* is a vectorlength (vl) and must be an integer with the value 2, 4, 8, or 16. This clause tells the compiler that each routine invocation at the call site should execute the computation equivalent to *n* times the scalar function execution. `linear clause`, in the form *linear(param1:step1 [, param2:step2] …)*, where *param* is a scalar variable and *step* is a compile-time integer constant expression. This clause tells the compiler that for each consecutive invocation of the routine in a serial execution, the value of *param1* is incremented by *step1*, *param2* is incremented by *step2*, and so on. If more than one step is specified for a particular variable, a compile-time error occurs. Multiple linear clauses are merged as a union.

	`uniform clause`, in the form *uniform(param [, param,]…)*, where param is a formal parameter of the specified function. This clause tells the compiler that the values of the specified arguments can be broadcast to all iterations as a performance optimization. `mask clause`, in the form *[no]mask*. This clause tells the compiler to generate a masked vector version of the routine.

Description

This keyword combines with the `map` operation at the call site to provide the data parallel semantics. When multiple instances of the vector declaration are invoked in a parallel context, the execution order among them is not sequenced.

vector_variant

Specifies a vector variant function that corresponds to its original C/C++ scalar function. This vector variant function can be invoked under vector context at call sites.

Syntax

Windows* OS:

`__declspec(vector_variant(`*`clauses`*`))`

Linux* OS:

`__attribute__((vector_variant(`*`clauses`*`)))`

Arguments

`clauses`	Is the following: `implements` clause, in the form *implements (<function declarator>) [, <simd-clauses>])*, where *function declarator* is the original scalar function, and *simd-clauses* is one or more of the clauses allowed for the vector attribute. The *simd-clauses* are optional.

Description

This attribute provides a means for programmers to describe the association between the vector variant function and its corresponding scalar function. The compiler will use the vector variant to replace the scalar call for a vectorized loop.

The following are restrictions for this attribute:

- A vector variant function can have only one `vector_variant` annotation.
- A vector variant annotation can have only one `implements` clause.
- A vector variant annotation applies to only one vector variant function, which must not have both `mask` and `nomask` clauses specified. It can be specified with either `mask` or `nomask`; the default is `nomask`.
- A vector variant function should have the `__regcall` attribute.

If the user-defined vector variant function is a variant with `mask`, the `mask` argument should be the last argument.

Example

The following shows an example of a vector variant function:

```
#include <immintrin.h>
__declspec(noinline)
float MyAdd(float* a, int b) { return *a + b; }
__declspec(vector_variant(implements(MyAdd(float *a, int b)),
                          linear(a), vectorlength(8),
                          nomask, processor(core_2nd_gen_avx)))
__m256 __regcall MyAddVec(float* v_a, __m128i v_b, __m128i v_b2) {
  __m256i t96 = _mm256_castsi128_si256(v_b);
  __m256i tmp = _mm256_insertf128_si256(t96, v_b2, 1);
  __m256  t95 = _mm256_cvtepi32_ps(tmp);
  return _mm256_add_ps(*((__m256*)v_a), t95);
}
float x[2000], y[2000];
float foo(float y[]) {
#pragma omp simd
  for (int k=0; k< 2000; k++) {
    x[k] = MyAdd(&y[k], k);
  }
  return x[0] + x[1999];
```

If the return value contains more than one register, the following technique can be used for the correct definition of the function:

```
#include <immintrin.h>

typedef struct {
 __m256d r1;
 __m256d r2;
} __m256dx2;

__declspec(noinline)
double MyAdd(double* a, int b) { return *a + b; }

__declspec(vector_variant(implements(MyAdd(double *a, int b)),
                          linear(a), vectorlength(8),
                          nomask, processor(core_2nd_gen_avx)))
__m256dx2 __regcall MyAddVec(double* v_a, __m128i v_b, __m128i v_b2) {
  __m256d t1 = _mm256_cvtepi32_pd(v_b);
  __m256d t2 = _mm256_cvtepi32_pd(v_b2);
  __m256dx2 ret;
  ret.r1 = _mm256_mul_pd(t1,*((__m256d*)v_a));
  ret.r2 = _mm256_mul_pd(t2,*(((__m256d*)v_a)+1));
  return ret;
}

__declspec(align(32)) double x[2000], y[2000];
double foo(double* y) {
#pragma omp simd
  for (int k=0; k< 2000; k++) {
    x[k] = MyAdd(y, k);
    y++;
  }
  return x[0] + x[1999];
}
```

Intrinsics

This intrinsics section provides an introduction and information on Intel specific intrinsics. The Intel® Intrinsics Guide provides detailed information and a lookup tool for viewing the available Intel intrinsics.

The following is some general information:

- Intrinsics are assembly-coded functions that let you use C++ function calls and variables in place of assembly instructions.
- Intrinsics can be used only on the host.
- Intrinsics are expanded inline eliminating function call overhead. Providing the same benefit as using inline assembly, intrinsics improve code readability, assist instruction scheduling, and help reduce debugging.
- Intrinsics provide access to instructions that cannot be generated using the standard constructs of the C and C++ languages.

> **NOTE**
> When developing and debugging your program with the Intel® C++ Compiler Classic, compile your sources with `-D__INTEL_COMPILER_USE_INTRINSIC_PROTOTYPES` to take advantage of improved compile-time checking of the intrinsics functions. When done be sure to remove this option as it significantly increases compile time.

Availability of Intrinsics on Intel Processors

Not all Intel® processors support all intrinsics. For information on which intrinsics are supported on Intel® processors, visit the Product Specification, Processors page. The Processor Spec Finder tool links directly to all processor documentation and the datasheets list the features, including intrinsics, supported by each processor.

Details about Intrinsics

All instructions use the following features:

- Registers
- Data Types

Registers

Intel® processors provide special register sets for different instructions.

- Intel® MMX™ instructions use eight 64-bit registers (`mm0` to `mm7`) which are aliased on the floating-point stack registers.
- Intel® Streaming SIMD Extensions (Intel® SSE) and the Advanced Encryption Standard (AES) instructions use eight 128-bit registers (`xmm0` to `xmm7`).
- Intel® Advanced Vector Extensions (Intel® AVX) instructions use 256-bit registers which are extensions of the 128-bit SIMD registers.
- Intel® Advanced Vector Extensions 512 (Intel® AVX-512) instructions use 512-bit registers.

Because each of these registers can hold more than one data element, the processor can process more than one data element simultaneously. This processing capability is also known as single-instruction multiple data processing (SIMD).

For each computational and data manipulation instruction in the new extension sets, there is a corresponding C intrinsic that implements that instruction directly. This frees you from managing registers and assembly programming. Further, the compiler optimizes the instruction scheduling so that your executable runs faster.

Data Types

Intrinsic functions use new C data types as operands, representing the new registers that are used as the operands to these intrinsic functions.

The following table details for which instructions each of the new data types are available. A 'Yes' indicates that the data type is available for that group of intrinsics; an 'NA' indicates that the data type is not available for that group of intrinsics.

Data Types --> Technology	__m64	__m128	__m128d	__m128i	__m256	__m256d	__m256i	__m512	__m512d	__m512i

__m64 Data Type

The `__m64` data type is used to represent the contents of an MMX register, which is the register that is used by the MMX™ technology intrinsics. The `__m64` data type can hold eight 8-bit values, four 16-bit values, two 32-bit values, or one 64-bit value.

__m128 Data Types

The __m128 data type is used to represent the contents of a SSE register used by the Intel® Streaming SIMD Extensions (Intel® SSE) intrinsics.

Conventionally, the __m128 data type can hold four 32-bit floating-point values, while the __m128d data type can hold two 64-bit floating-point values, and the __m128i data type can hold sixteen 8-bit, eight 16-bit, four 32-bit, or two 64-bit integer values.

The compiler aligns __m128d and _m128i local and global data to 16-byte boundaries on the stack. To align integer, float, or double arrays, use the __declspec(align) statement.

Accessing __m128i Data

To access 8-bit data on IA-32 and Intel® 64 architecture-based systems, use the mm_extract intrinsics as follows:

```
#define _mm_extract_epi8(x, imm) \
((((imm) & 0x1) == 0) ?   \
_mm_extract_epi16((x), (imm) >> 1) & 0xff : \
_mm_extract_epi16(_mm_srli_epi16((x), 8), (imm) >> 1))
```

To access 16-bit data, use:

```
int _mm_extract_epi16(__m128i a, int imm)
```

To access 32-bit data, use:

```
#define _mm_extract_epi32(x, imm) \
_mm_cvtsi128_si32(_mm_srli_si128((x), 4 * (imm)))
```

To access 64-bit data (Intel® 64 architecture only), use:

```
#define _mm_extract_epi64(x, imm) \
_mm_cvtsi128_si64(_mm_srli_si128((x), 8 * (imm)))
```

__m256 Data Types

The __m256 data type is used to represent the contents of the extended SSE register - the YMM register, used by the Intel® AVX intrinsics.

The __m256 data type can hold eight 32-bit floating-point values, while the __m256d data type can hold four 64-bit double precision floating-point values, and the __m256i data type can hold thirty-two 8-bit, sixteen 16-bit, eight 32-bit, or four 64-bit integer values. See Details for Intel® AVX Intrinsics for more information.

__m512 Data Types

The __m512 data type is used to represent the contents of the extended SSE register - the ZMM register, used by the Intel® AVX-512 intrinsics.

The __m512 data type can hold sixteen 32-bit floating-point values, while the __m512d data type can hold eight 64-bit double precision floating-point values, and the __m512i data type can hold sixty-four 8-bit, thirty-two 16-bit, sixteen 32-bit, or eight 64-bit integer values. See Overview: Intrinsics for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) Instructions for more information.

Data Types Usage Guidelines

These data types are not basic ANSI C data types. You must observe the following usage restrictions:

- Use data types as objects in aggregates, such as unions, to access the byte elements and structures.

See Also

__declspec(align) declaration

Naming and Usage Syntax

Most intrinsic names use the following notational convention:

```
_mm_<intrin_op>_<suffix>
```

The following table explains each item in the syntax.

<intrin_op>	Indicates the basic operation of the intrinsic; for example, add for addition and sub for subtraction.
<suffix>	Denotes the type of data the instruction operates on. The first one or two letters of each suffix denote whether the data is packed (p), extended packed (ep), or scalar (s). The remaining letters and numbers denote the type, with notation as follows: • s single-precision floating point • d double-precision floating point • i128 signed 128-bit integer • i64 signed 64-bit integer • u64 unsigned 64-bit integer • i32 signed 32-bit integer • u32 unsigned 32-bit integer • i16 signed 16-bit integer • u16 unsigned 16-bit integer • i8 signed 8-bit integer • u8 unsigned 8-bit integer

A number appended to a variable name indicates the element of a packed object. For example, r0 is the lowest word of r. Some intrinsics are "composites" because they require more than one instruction to implement them.

The packed values are represented in right-to-left order, with the lowest value being used for scalar operations. Consider the following example operation:

```
double a[2] = {1.0, 2.0};
__m128d t = _mm_load_pd(a);
```

The result is the same as either of the following:

```
__m128d t = _mm_set_pd(2.0, 1.0);
__m128d t = _mm_setr_pd(1.0, 2.0);
```

In other words, the xmm register that holds the value t appears as follows:

The "scalar" element is 1.0. Due to the nature of the instruction, some intrinsics require their arguments to be immediates (constant integer literals).

Intrinsics for All Intel® Architectures

Most of the intrinsics documented in this section function for all supported Intel® architectures.

Some of the intrinsics documented in this section function across a subset of Intel® architectures.

Integer Arithmetic Intrinsics

The following table lists and describes integer arithmetic intrinsics that you can use across Intel® architectures.

Intrinsic Syntax	Description
Intrinsics for all Supported Intel® Architectures	
`int abs(int)`	Returns the absolute value of an integer.
`long labs(long)`	Returns the absolute value of a long integer.
`unsigned long _lrotl(unsigned long` *value*`, int` *shift*`)`	Implements 64-bit left rotate of *value* by *shift* positions.
`unsigned long _lrotr(unsigned long` *value*`, int` *shift*`)`	Implements 64-bit right rotate of *value* by *shift* positions.
`unsigned int _rotl(unsigned int` *value*`, int` *shift*`)`	Implements 32-bit left rotate of *value* by *shift* positions.
`unsigned int _rotr(unsigned int` *value*`, int` *shift*`)`	Implements 32-bit right rotate of *value* by *shift* positions.

Intrinsics for IA-32 and Intel® 64 Architectures	
`unsigned short _rotwl(unsigned short value, int shift)`	Implements 16-bit left rotate of *value* by *shift* positions.
`unsigned short _rotwr(unsigned short value, int shift)`	Implements 16-bit right rotate of *value* by *shift* positions.

NOTE
Passing a constant *shift* value in the rotate intrinsics results in higher performance.

Floating-point Intrinsics

The following table lists and describes floating point intrinsics that you can use across all Intel® and compatible architectures. Floating-point intrinsic functions may invoke library functions that are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.

Intrinsic	Description
`double fabs(double)`	Returns the absolute value of a floating-point value.
`double log(double)`	Returns the natural logarithm ln(x), x>0, with double precision.
`float logf(float)`	Returns the natural logarithm ln(x), x>0, with single precision.
`double log10(double)`	Returns the base 10 logarithm log10(x), x>0, with double precision.
`float log10f(float)`	Returns the base 10 logarithm log10(x), x>0, with single precision.
`double exp(double)`	Returns the exponential function with double precision.
`float expf(float)`	Returns the exponential function with single precision.
`double pow(double, double)`	Returns the value of *x* to the power *y* with double precision.
`float powf(float, float)`	Returns the value of *x* to the power *y* with single precision.
`double sin(double)`	Returns the sine of *x* with double precision.
`float sinf(float)`	Returns the sine of *x* with single precision.
`double cos(double)`	Returns the cosine of *x* with double precision.
`float cosf(float)`	Returns the cosine of *x* with single precision.
`double tan(double)`	Returns the tangent of *x* with double precision.
`float tanf(float)`	Returns the tangent of *x* with single precision.
`double acos(double)`	Returns the inverse cosine of *x* with double precision.
`float acosf(float)`	Returns the inverse cosine of *x* with single precision.
`double acosh(double)`	Compute the inverse hyperbolic cosine of the argument with double precision.

Intrinsic	Description
`float acoshf(float)`	Compute the inverse hyperbolic cosine of the argument with single precision.
`double asin(double)`	Compute inverse sine of the argument with double precision.
`float asinf(float)`	Compute inverse sine of the argument with single precision.
`double asinh(double)`	Compute inverse hyperbolic sine of the argument with double precision.
`float asinhf(float)`	Compute inverse hyperbolic sine of the argument with single precision.
`double atan(double)`	Compute inverse tangent of the argument with double precision.
`float atanf(float)`	Compute inverse tangent of the argument with single precision.
`double atanh(double)`	Compute inverse hyperbolic tangent of the argument with double precision.
`float atanhf(float)`	Compute inverse hyperbolic tangent of the argument with single precision.
`double cabs(double complex z)`	Computes absolute value of complex number. The intrinsic argument is a complex number made up of two double precision elements, one real and one imaginary. The input parameter *z* is made up of two values of double type passed together as a single argument.
`float cabsf(float complex z)`	Computes absolute value of complex number. The intrinsic argument is a complex number made up of two single precision elements, one real and one imaginary. The input parameter *z* is made up of two values of float type passed together as a single argument.
`double ceil(double)`	Computes smallest integral value of double precision argument not less than the argument.
`float ceilf(float)`	Computes smallest integral value of single precision argument not less than the argument.
`double cosh(double)`	Computes the hyperbolic cosine of double precision argument.
`float coshf(float)`	Computes the hyperbolic cosine of single precision argument.
`float fabsf(float)`	Computes absolute value of single precision argument.
`double floor(double)`	Computes the largest integral value of the double precision argument not greater than the argument.
`float floorf(float)`	Computes the largest integral value of the single precision argument not greater than the argument.
`double fmod(double)`	Computes the floating-point remainder of the division of the first argument by the second argument with double precision.
`float fmodf(float)`	Computes the floating-point remainder of the division of the first argument by the second argument with single precision.

Intrinsic	Description
`double hypot(double, double)`	Computes the length of the hypotenuse of a right angled triangle with double precision.
`float hypotf(float, float)`	Computes the length of the hypotenuse of a right angled triangle with single precision.
`double rint(double)`	Computes the integral value represented as double using the IEEE rounding mode.
`float rintf(float)`	Computes the integral value represented with single precision using the IEEE rounding mode.
`double sinh(double)`	Computes the hyperbolic sine of the double precision argument.
`float sinhf(float)`	Computes the hyperbolic sine of the single precision argument.
`float sqrtf(float)`	Computes the square root of the single precision argument.
`double tanh(double)`	Computes the hyperbolic tangent of the double precision argument.
`float tanhf(float)`	Computes the hyperbolic tangent of the single precision argument.

String and Block Copy Intrinsics

The following table lists and describes string and block copy intrinsics that you can use on systems based on IA-32 and Intel® 64 architectures. They may invoke library functions that are more highly optimized for Intel® microprocessors than for non-Intel microprocessors.

NOTE
`strncpy()` and `strncmp()` functions are implemented as intrinsics depending on compiler version and compiler switches like optimization level.

Intrinsic	Description
`char *_strset(char *, _int32)`	Sets all characters in a string to a fixed value.
`int memcmp(const void *cs, const void *ct, size_t n)`	Compares two regions of memory. Return: • <0 if *cs*<*ct* • 0 if *cs*=*ct* • >0 if *cs*>*ct*
`void *memcpy(void *s, const void *ct, size_t n)`	Copies from memory. Returns *s*.
`void *memset(void *s, int c, size_t n)`	Sets memory to a fixed value. Returns *s*.
`char *strcat(char *s, const char *ct)`	Appends to a string. Returns *s*.
`int strcmp(const char *, const char *)`	Compares two strings. Return <0 if `cs`<*ct*, 0 if *cs*=*ct*, or >0 if *cs*>*ct*.

Intrinsic	Description
`char *strcpy(char *s, const char *ct)`	Copies a string. Returns `s`.
`size_t strlen(const char *cs)`	Returns the length of string *cs*.
`int strncmp(char *, char *, int)`	Compare two strings, but only specified number of characters.
`int strncpy(char *, char *, int)`	Copies a string, but only specified number of characters.

Miscellaneous Intrinsics

The following tables list and describe intrinsics that you can use across all Intel® architectures, except where noted. These intrinsics are available for both Intel® and non-Intel microprocessors but they may perform additional optimizations for Intel® microprocessors than they perform for non-Intel microprocessors.

NOTE
Casting functions for various `INT` and `FP` types for use in intrinsic functions across Intel® architectures only change the type; they *do not* convert between integer and floating point values.

Intrinsic	Description
Intrinsics for all Supported Intel® Architectures	
`__cpuid`	Queries the processor for information about processor type and supported features. The Intel® C++ Compiler Classic supports the Microsoft* implementation of this intrinsic. See the Microsoft documentation for details.
`void *_alloca(int)`	Allocates memory in the local stack frame. The memory is automatically freed upon return from the function.
`int _bit_scan_forward(int x)`	Returns the bit index of the least significant set bit of *x*. If *x* is 0, the result is undefined.
`int _bit_scan_reverse(int)`	Returns the bit index of the most significant set bit of *x*. If *x*is 0, the result is undefined.

`unsigned char _BitScanForward(unsigned __int32 *p, unsigned __int32 b);`
and for Intel® 64 architecture only:
`unsigned char _BitScanForward64(unsigned __int32 *p, unsigned __int64 b);`
	Sets **p* to the bit index of the least significant set bit of *b* or leaves it unchanged if *b* is zero. The function returns a non-zero result when *b* is non-zero and returns zero when *b* is zero.

`unsigned char _BitScanReverse(unsigned __int32 *p, unsigned __int32 b);` and for Intel® 64 architecture only:	Sets **p* to the bit index of the most significant set bit of *b* or leaves it unchanged if *b* is zero. The function returns a non-zero result when *b* is non-zero and returns zero when *b* is zero.

Intrinsic	Description
Intrinsics for all Supported Intel® Architectures	
`unsigned char _BitScanReverse64(unsigned __int32 *p, unsigned __int64 b);`	

`unsigned char _bittest(__int32 *p, __int32 b);`
and for Intel® 64 architecture only:
`unsigned char _bittest64(__int64 *p, __int64 b);`
	Returns the bit in position *b* of the memory addressed by *p*.

`unsigned char _bittestandcomplement(__int32 *p, __int32 b);`
and for Intel® 64 architecture only:
`unsigned char _bittestandcomplement64(__int64 *p, __int64 b);`
	Returns the bit in position *b* of the memory addressed by *p*, then compliments that bit.

`unsigned char _bittestandreset(__int32 *p, __int32 b);`
and for Intel® 64 architecture only:
`unsigned char _bittestandreset64(__int64 *p, __int64 b);`
	Returns the bit in position *b* of the memory addressed by *p*, then resets that bit to 0.

`unsigned char _bittestandset(__int32 *p, __int32 b);`
and for Intel® 64 architecture only:
`unsigned char _bittestandset64(__int64 *p, __int64 b);`
	Returns the bit in position *b* of the memory addressed by *p*, then sets the bit to 1.

`int _bswap(int)`	Reverses the byte order of *x*. Swaps 4 bytes; bits 0-7 are swapped with bits 24-31, bits 8-15 are swapped with bits 16-23.
`__int64 _bswap64(__int64 x)`	Reverses the byte order of *x*. Swaps 8 bytes; bits 0-7 are swapped with bits 56-63, bits 8-15 are swapped with bits 48-55, bits 16-23 are swapped with bits 40-47, and bits 24-31 are swapped with bits 32-39.

Intrinsic	Description
Intrinsics for all Supported Intel® Architectures	
`unsigned int __cacheSize(unsigned int cacheLevel)`	`__cacheSize(n)` returns the size in kilobytes of the cache at level n. 1 represents the first-level cache. 0 is returned for a non-existent cache level. For example, an application may query the cache size and use it to select block sizes in algorithms that operate on matrices.
`void _enable(void)`	Enables the interrupt.
`unsigned __int32 _castf32_u32(float)`	Casts *float* value to unsigned 32-bit integer.
`unsigned __int64 _castf64_u64(double)`	Casts *double* value to unsigned 64-bit integer.
`float _castu32_f32(unsigned __int32)`	Casts unsigned 32-bit integer to *float32*.
`double _castu64_f64(unsigned __int64)`	Casts unsigned 32-bit integer to *float64*.
`void _disable(void)`	Disables the interrupt.
`int _in_byte(int)`	Intrinsic that maps to the IA-32 instruction `IN`. Transfer data byte from port specified by argument.
`int _in_dword(int)`	Intrinsic that maps to the IA-32 instruction `IN`. Transfer double word from port specified by argument.
`int _in_word(int)`	Intrinsic that maps to the IA-32 instruction `IN`. Transfer word from port specified by argument.
`int _inp(int)`	Same as `_in_byte`.
`int _inpd(int)`	Same as `_in_dword`.
`int _inpw(int)`	Same as `_in_word`.
`int _out_byte(int, int)`	Intrinsic that maps to the IA-32 instruction `OUT`. Transfer data byte in second argument to port specified by first argument.
`int _out_dword(int, int)`	Intrinsic that maps to the IA-32 instruction `OUT`. Transfer double word in second argument to port specified by first argument.
`int _out_word(int, int)`	Intrinsic that maps to the IA-32 instruction `OUT`. Transfer word in second argument to port specified by first argument.
`int _outp(int, int)`	Same as `_out_byte`.
`int _outpw(int, int)`	Same as `_out_word`.
`int _outpd(int, int)`	Same as `_out_dword`.
`int _popcnt32(int` *x*`)`	Returns the number of set bits in *x*.

Intrinsic	Description
Intrinsics for all Supported Intel® Architectures	
`int _popcnt64(__int64 x)`	Returns the number of set bits in *x*.
`__int64 _rdpmc(int p)`	Returns the current value of the 40-bit performance monitoring counter specified by *p*.
Intrinsics for IA-32 and Intel® 64 Architectures	
`__int64 _rdtsc(void)`	Returns the current value of the processor's 64-bit time stamp counter.
`int _setjmp(jmp_buf)`	A fast version of `setjmp()`, which bypasses the termination handling. Saves the callee-save registers, stack pointer and return address.
`int __pin_value(char *annotation)`	Bypasses code that executes only in PIN mode. Especially useful with Intel® oneAPI Threading Building Blocks (oneTBB), which adds specified annotations to the object file so that code is executed in PIN mode.

_may_i_use_cpu_feature

Queries the processor dynamically at the source level (this intrinsic does not perform a vendor check) to determine if processor-specific features are available.

Syntax

```
extern int _may_i_use_cpu_feature(unsigned __int64);
```

Arguments

unsigned __int64	An unsigned __int64 bitset representing one or more cpuid features. The arguments for feature query accepted by this intrinsic is:
	`_FEATURE_GENERIC_IA32`
	`_FEATURE_FPU`
	`_FEATURE_CMOV`
	`_FEATURE_MMX`
	`_FEATURE_FXSAVE`
	`_FEATURE_SSE`
	`_FEATURE_SSE2`
	`_FEATURE_SSE3`
	`_FEATURE_SSSE3`
	`_FEATURE_SSE4_1`
	`_FEATURE_SSE4_2`
	`_FEATURE_POPCNT`

_FEATURE_MOVBE

_FEATURE_PCLMULQDQ

_FEATURE_AES

_FEATURE_F16C

_FEATURE_AVX

_FEATURE_RDRND

_FEATURE_FMA

_FEATURE_BMI

_FEATURE_LZCNT

_FEATURE_HLE

_FEATURE_RTM

_FEATURE_AVX2

_FEATURE_ADX

_FEATURE_RDSEED

_FEATURE_AVX512DQ

_FEATURE_AVX512F

_FEATURE_AVX512ER

_FEATURE_AVX512PF

_FEATURE_AVX512CD

_FEATURE_AVX512BW

_FEATURE_AVX512VL

_FEATURE_SHA

_FEATURE_MPX

_FEATURE_AVX512IFMA52

_FEATURE_AVX512VBMI

_FEATURE_AVX512_4FMAPS

_FEATURE_AVX512_4VNNIW

Description

This intrinsic queries the processor on which it is running to check the availability of the given features. This check is dynamically performed at the point in the source where it is called. For example:

```
if (_may_i_use_cpu_feature(_FEATURE_SSE4_2)) {
            Use SSE4.2 intrinsics;
} Else {
            Use generic code;
}
```

The `_may_i_use_feature` intrinsic, in this case, dynamically checks if the code is being executed on a processor that supports SSE4.2, and returns **true** if it is supported, or **false**. The `_may_i_use_feature` also accepts multiple features within a single argument, for example:

```
if (_may_i_use_cpu_feature(_FEATURE_SSE |
                    _FEATURE_SSE2 |
                    _FEATURE_SSE3 |
                    _FEATURE_SSSE3 |
                    _FEATURE_MOVBE) &&
                    !_may_i_use_cpu_feature(_FEATURE_SSE4_1)) {
printf("\nYou are running on an Atom processor."\n");
}
```

This intrinsic does not perform processor vendor checks that other features do (`-m <cpu>` type option).

Returns

Result of the feature query, true or false (1 or 0) for whether the set of features is available on the machine on which the intrinsic is executed.

_allow_cpu_features

Tells the compiler that the code region may be targeted for processors with the specified features. The compiler may then generate optimized code for the specified features.

Syntax

`extern void _allow_cpu_features(unsigned __int64);`

Arguments

unsigned __int64	an unsigned __int64 bitset representing one or more cpuid features: _FEATURE_GENERIC_IA32 _FEATURE_FPU _FEATURE_CMOV _FEATURE_MMX _FEATURE_FXSAVE _FEATURE_SSE _FEATURE_SSE2 _FEATURE_SSE3 _FEATURE_SSSE3

`_FEATURE_AVX512IFMA52`

`_FEATURE_AVX512VBMI`

`_FEATURE_AVX512_4FMAPS`

`_FEATURE_AVX512_4VNNIW`

Description

Use this intrinsic function to use the specified processor feature at a code block level. The function only affects the scope of the code following the function call. Ensure that the code block will run only on processors with the specified features. If the code runs on a processor without the specified feature, the program may fail with an illegal instruction exception.

The function accepts a single argument that is a bitmask. In cases where one ISA depends on another, the higher ISA typically implies the lower. For example, the following arguments produce the same assembly code:

- `_FEATURE_SSE2|_FEATURE_AVX|_FEATURE_AVX512F`
- `_FEATURE_AVX512F`

The argument can only add features to those specified by the `[Q]x` or `-m` (Linux* and macOS) or `/arch` (Windows*) options, it cannot remove features.

This function does not itself cause the compiler to generate multiple code paths. To do that, you need to use `_may_i_use_cpu_feature()`.

> **NOTE**
> See the Release Notes for the latest information about this function.

To use specified processor features at a function level, use the `cpu_dispatch` or the `cpu_specific` attribute or the `optimization_parameter` pragma.

To use specified processor features at the file level, use the `[Q]x` compiler option.

The following example demonstrates how to use this intrinsic function to allow the compiler to generate the necessary code to use the Advanced Vector Extensions (AVX) and Streaming SIMD Extensions 2 (SSE2) features in the processor.

```
#include <string.h>
#include <immintrin.h>

#define MAXIMGS            20
#define MAXNAME            512

typedef struct {
  int x;                  /* image X axis size              */
  int y;                  /* image Y axis size              */
  int bpp;                /* image bits */
  char name[MAXNAME];     /* image full filename */
  unsigned char * data;   /* pointer to raw byte image data */
} rawimage;

extern rawimage * imagelist[MAXIMGS];
extern int numimages;

rawimage* CreateImage(char * filename)
{
       rawimage* newimage = NULL;
       int i, len, intable;

       intable=0;
       if (numimages!=0) {

             _allow_cpu_features(_FEATURE_SSE2 | _FEATURE_AVX);
             for (i=0; i<numimages; i++) {
                    if (!strcmp(filename, imagelist[i]->name)) {
                           newimage=imagelist[i];
                           intable=1;
                    }
             }
       }

       if (!intable) {
             newimage=(rawimage *)malloc(sizeof(rawimage));
             if (newimage != NULL) {
```

```
                    strcpy(newimage->name, filename);

                    imagelist[numimages]=newimage;  /* add new one to the table       */
                    numimages++;                    /* increment the number of images */
            }
    }

    return newimage;
}
```

Returns

Returns nothing.

Data Alignment, Memory Allocation Intrinsics, and Inline Assembly

This section describes features that support usage of the intrinsics.

Alignment Support

Aligning data improves the performance of intrinsics. When using the Intel® Streaming SIMD Extensions (Intel® SSE) intrinsics, you should align data to 16 bytes in memory operations. Specifically, you must align `__m128` objects as addresses passed to the `_mm_load` and `_mm_store` intrinsics. If you want to declare arrays of floats and treat them as `__m128` objects by casting, you need to ensure that the float arrays are properly aligned.

Use `__declspec(align)` to direct the compiler to align data more strictly than it otherwise would. For example, a data object of type `int` is allocated at a byte address which is a multiple of 4 by default. By using `__declspec(align)`, you can direct the compiler to instead use an address which is a multiple of 8, 16, or 32 (with the following restriction on IA-32 architecture: 16-byte addresses can be locally or statically allocated).

You can use this data alignment support as an advantage in optimizing cache line usage. By clustering small objects that are commonly used together into a `struct`, and forcing the `struct` to be allocated at the beginning of a cache line, you can effectively guarantee that each object is loaded into the cache as soon as any one is accessed, resulting in a significant performance benefit.

For 16-byte alignment, you can use the macro `_MM_ALIGN16`, which other compilers can support by including header files. This macro enables you to write portable code that does not rely on compiler support for `__declspec(align)`.

See Also

__declspec(align) declaration

Programming Example includes example of _MM_ALIGN16

Allocating and Freeing Aligned Memory Blocks

To allocate and free aligned blocks of memory use the _mm_malloc and _mm_free intrinsics. These intrinsics are based on malloc and free, which are in the libirc.a library. You need to include malloc.h. The syntax for these intrinsics is as follows:

```
void* _mm_malloc (size_t size, size_t align )
```

```
void _mm_free (void *p)
```

The _mm_malloc routine takes an extra parameter, which is the alignment constraint. This constraint must be a power of two. The pointer that is returned from _mm_malloc is guaranteed to be aligned on the specified boundary.

> **NOTE**
> Memory that is allocated using _mm_malloc must be freed using _mm_free . Calling free on memory allocated with _mm_malloc or calling _mm_free on memory allocated with malloc will cause unpredictable behavior.

Inline Assembly

Microsoft* Style Inline Assembly

The Intel® C++ Compiler supports Microsoft-style inline assembly on Windows*. The Intel® C++ Compiler supports Microsoft-style inline assembly on Linux* when used with the -use-msasm option. See the Microsoft documentation for the proper syntax.

GNU*-like Style Inline Assembly (IA-32 architecture and Intel® 64 architecture only)

The Intel® C++ Compiler supports GNU-like style inline assembly. The syntax is as follows:

```
asm-keyword [ volatile-keyword ] ( asm-template [ asm-interface ] ) ;
```

The Intel® C++ Compiler also supports mixing UNIX* and Microsoft* style asms. Use the __asm__ keyword for GNU-style ASM when using the -use_msasm switch.

> **NOTE**
> The Intel® C++ Compiler supports gcc-style inline ASM if the assembler code uses AT&T* System V/386 syntax.

Syntax Element	Description
asm-keyword	Assembly statements begin with the keyword asm. Alternatively, either __asm or __asm__ may be used for compatibility. When mixing UNIX* and Microsoft* style asm, use the __asm__ keyword.

Syntax Element	Description
	The compiler only accepts the `__asm__` keyword. The `asm` and `__asm` keywords are reserved for Microsoft* style assembly statements.
`volatile-keyword`	If the optional keyword `volatile` is given, the `asm` is volatile. Two volatile `asm` statements are never moved past each other, and a reference to a volatile variable is not moved relative to a volatile `asm`. Alternate keywords `__volatile` and `__volatile__` may be used for compatibility.
`asm-template`	The `asm-template` is a C language ASCII string that specifies how to output the assembly code for an instruction. Most of the template is a fixed string; everything but the substitution-directives, if any, is passed through to the assembler. The syntax for a substitution directive is a `%` followed by one or two characters.
`asm-interface`	The `asm-interface` consists of three parts: **1.** An optional `output-list` **2.** An optional `input-list` **3.** An optional `clobber-list` These are separated by colon (:) characters. If the `output-list` is missing, but an `input-list` is given, the input list may be preceded by two colons (::) to take the place of the missing `output-list`. If the `asm-interface` is omitted altogether, the `asm` statement is considered volatile regardless of whether a `volatile-keyword` was specified.
`output-list`	An `output-list` consists of one or more output-specs separated by commas. For the purposes of substitution in the `asm-template`, each output-spec is numbered. The first operand in the `output-list` is numbered 0, the second is 1, and so on. Numbering is continuous through the `output-list` and into the `input-list`. The total number of operands is limited to 30 (i.e. 0-29).
`input-list`	Similar to an `output-list`, an `input-list` consists of one or more input-specs separated by commas. For the purposes of substitution in the `asm-template`, each input-spec is numbered, with the numbers continuing from those in the `output-list`.
`clobber-list`	A `clobber-list` tells the compiler that the `asm` uses or changes a specific machine register that is either coded directly into the `asm` or is changed implicitly by the assembly instruction. The `clobber-list` is a comma-separated list of `clobber-specs`.
`input-spec`	The `input-specs` tell the compiler about expressions whose values may be needed by the inserted assembly instruction. In order to describe fully the input requirements of the `asm`, you can list input-specs that are not actually referenced in the `asm-template`.
`clobber-spec`	Each `clobber-spec` specifies the name of a single machine register that is clobbered. The register name may optionally be preceded by a `%`. You can specify any valid machine register name. It is also legal to specify "memory" in a `clobber-spec`. This prevents the compiler from keeping data cached in registers across the `asm` statement.

When compiling an assembly statement on Linux*, the compiler simply emits the asm-template to the assembly file after making any necessary operand substitutions. The compiler then calls the GNU* assembler to generate machine code. In contrast, on Windows* the compiler itself must assemble the text contained in the asm-template string into machine code. In essence, the compiler contains a built-in assembler.

The compiler's built-in assembler supports the GNU* `.byte` directive but does not support other functionality of the GNU* assembler, so there are limitations in the contents of the asm-template. The following assembler features are not currently supported.

- Directives other than the `.byte` directive
- Symbols*

NOTE
* Direct symbol references in the asm-template are not supported. To access a C++ object, use the `asm-interface` with a substitution directive.

Example

Incorrect method for accessing a C++ object:

```
__asm__("addl $5, _x");
```

Proper method for accessing a C++ object:

```
__asm__("addl $5, %0" : "+rm" (x));
```

Additionally, there are some restrictions on the usage of labels. The compiler only allows local labels, and only references to labels within the same assembly statement are permitted. A local label has the form "*N:*", where *N* is a non-negative integer. *N* does not have to be unique, even within the same assembly statement. To reference the most recent definition of label *N*, use "*Nb*". To reference the next definition of label *N*, use "*Nf*". In this context, "*b*" means backward and "*f*" means forward. For more information, refer to the GNU assembler documentation.

GNU-style inline assembly statements on Windows* use the same assembly instruction format as on Linux* which is often referenced as AT&T* assembly syntax. This means that destination operands are on the right and source operands are on the left. This operand order is the reverse of Intel assembly syntax.

Due to the limitations of the compiler's built-in assembler, many assembly statements that compile and run on Linux* will not compile on Windows*. On the other hand, assembly statements that compile and run on Windows* should also compile and run on Linux*.

This feature provides a high-performance alternative to Microsoft-style inline assembly statements when portability between operating systems is important. Its intended use is in small primitives where high-performance integration with the surrounding C++ code is essential.

```
#ifdef _WIN64
#define INT64_PRINTF_FORMAT "I64"
#else
#define __int64 long long
#define INT64_PRINTF_FORMAT "L"
#endif
#include <stdio.h>
typedef struct {
    __int64 lo64;
    __int64 hi64;
} my_i128;
#define ADD128(out, in1, in2)                    \
    __asm__("addq %2, %0; adcq %3, %1" :         \
            "=r"(out.lo64), "=r"(out.hi64) :     \
```

```
            "emr" (in2.lo64), "emr"(in2.hi64),     \
            "0" (in1.lo64), "1" (in1.hi64));

extern int
main()
{
    my_i128 val1, val2, result;
    val1.lo64 = ~0;
    val1.hi64 = 0;

    val2.hi64 = 65;
    ADD128(result, val1, val2);
    printf("0x%016" INT64_PRINTF_FORMAT "x%016"   INT64_PRINTF_FORMAT "x\n",
            val1.hi64, val1.lo64);

    printf("+0x%016" INT64_PRINTF_FORMAT "x%016" INT64_PRINTF_FORMAT "x\n",
            val2.hi64, val2.lo64);

    printf("------------------------------------\n");
    printf("0x%016" INT64_PRINTF_FORMAT "x%016" INT64_PRINTF_FORMAT "x\n",
            result.hi64, result.lo64);
    return 0;
}
```

This example, written for Intel® 64 architecture, shows how to use a GNU-style inline assembly statement to add two 128-bit integers. In this example, a 128-bit integer is represented as two `__int64` objects in the `my_i128` structure. The inline assembly statement used to implement the addition is contained in the `ADD128` macro, which takes three `my_i128` arguments representing three 128-bit integers. The first argument is the output. The next two arguments are the inputs. The example compiles and runs using the Intel® C++ Compiler on Linux* or Windows*, producing the following output.

```
  0x0000000000000000ffffffffffffffff
+ 0x00000000000000410000000000000001
------------------------------------
+ 0x00000000000000420000000000000000
```

In the GNU-style inline assembly implementation, the asm interface specifies all the inputs, outputs, and side effects of the `asm` statement, enabling the compiler to generate very efficient code.

```
mov       r13, 0xffffffffffffffff
mov       r12, 0x000000000
add       r13, 1
adc       r12, 65
```

It is worth noting that when the compiler generates an assembly file on Windows*, it uses Intel syntax even though the assembly statement was written using AT&T* assembly syntax.

The compiler moves in`1.lo64` into a register to match the constraint of operand 4. Operand 4's constraint of "0" indicates that it must be assigned the same location as output operand 0. And operand 0's constraint is "`=r`", indicating that it must be assigned an integer register. In this case, the compiler chooses r13. In the same way, the compiler moves in `1.hi64` into register r12.

The constraints for input operands 2 and 3 allow the operands to be assigned a register location ("`r`"), a memory location ("`m`"), or a constant signed 32-bit integer value ("`e`"). In this case, the compiler chooses to match operands 2 and 3 with the constant values `1` and `65`, enabling the `add` and `adc` instructions to utilize the "register-immediate" forms.

The same operation is much more expensive using a Microsoft-style inline assembly statement, because the interface between the assembly statement and the surrounding C++ code is entirely through memory. Using Microsoft* assembly, the `ADD128` macro might be written as follows.

```
#define ADD128(out, in1, in2)                     \
    {                                             \
        __asm mov rax, in1.lo64                   \
        __asm mov rdx, in1.hi64                   \
        __asm add rax, in2.lo64                   \
        __asm adc rdx, in2.hi64                   \
        __asm mov out.lo64, rax                   \
        __asm mov out.hi64, rdx                   \
     }
```

The compiler must add code before the assembly statement to move the inputs into memory, and it must add code after the assembly statement to retrieve the outputs from memory. This prevents the compiler from exploiting some optimization opportunities. Thus, the following assembly code is produced.

```
        mov       QWORD PTR [rsp+32], -1
        mov       QWORD PTR [rsp+40], 0
        mov       QWORD PTR [rsp+48], 1
        mov       QWORD PTR [rsp+56], 65

; Begin ASM

        mov       rax, QWORD PTR [rsp+32]
        mov       rdx, QWORD PTR [rsp+40]
        add       rax, QWORD PTR [rsp+48]
        adc       rdx, QWORD PTR [rsp+56]
        mov       QWORD PTR [rsp+64], rax
        mov       QWORD PTR [rsp+72], rdx

; End ASM

        mov       rdx, QWORD PTR [rsp+72]
        mov       r8, QWORD PTR [rsp+64]
```

The operation that took only four instructions and no memory references using GNU-style inline assembly takes twelve instructions with twelve memory references using Microsoft-style inline assembly.

Intrinsics for Managing Extended Processor States and Registers

The Intel® C++ Compiler Classic provides twelve intrinsics for managing the extended processor states and extended registers. These intrinsics are available for IA-32 and Intel® 64 architectures running on supported operating systems.

To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

The intrinsics map directly to the hardware system instructions described in "Intel® 64 and IA-32 Architectures Software Developer's Manual, volumes 1, 2a, and 2b" and "Intel® Advanced Vector Extensions Programming Reference".

Functional Overview

The intrinsics for managing the extended processor states and extended registers include:

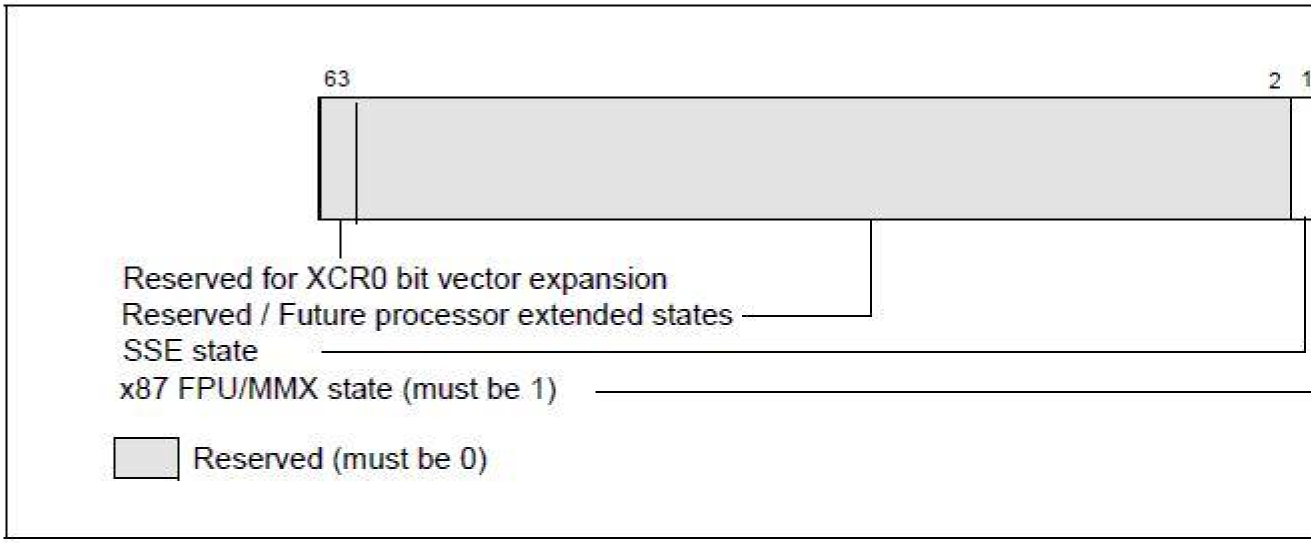
- Two intrinsics to read from and write to the specified extended control register. These intrinsics map to `XGETBV` and `XSETBV` instructions.
- Four intrinsics to save and restore the current state of the `x87 FPU`, `MMX`, `XMM`, and `MXCSR` registers. These intrinsics map to `FXSAVE`, `FXSAVE64`, `FXRSTOR`, and `FXRSTOR64` instructions.
- Six intrinsics to save and restore the current state of the `x87 FPU`, `MMX`, `XMM`, `YMM`, and `MXCSR` registers. These intrinsics map to `XSAVE`, `XSAVE64`, `XSAVEOPT`, `XSAVEOPT64`, `XRSTOR`, and `XRSTOR64` instructions.

Intrinsics for Reading and Writing the Content of Extended Control Registers

This group of intrinsics includes two intrinsics to read from and write to extended control registers (XCRs). Currently, the only such register defined is `XCR0`, `XFEATURE_ENABLED_MASK` register. This register specifies the set of processor states that the operating system enables on that processor, for example x87 FPU states, SSE states, and other processor extended states that Intel® 64 architecture may introduce in the future.

To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```



_xgetbv()

Reads the content of an extended control register.

Syntax

```
extern unsigned __int64 _xgetbv(unsigned int xcr);
```

Arguments

xcr	An extended control register to be read. Currently, only the value '0' is allowed.

Description

This intrinsic reads from extended control registers. Currently, the only control register allowed/defined is `(XCR0) XFEATURE_ENABLED_MASK` register. The corresponding constant is defined in the `immintrin.h` file to refer to this register:

```
#define _XCR_XFEATURE_ENABLED_MASK 0
```

This intrinsic maps to `XGETBV` instruction.

Returns

Returns the content of a specified extended control register.

_xsetbv()

Writes the given value to a specified extended control register.

Syntax

```
extern void _xsetbv(unsigned int xcr, unsigned __int64 val);
```

Arguments

xcr	An extended control register to be written. Currently, only the value '0' is allowed.
val	Value to be written to the specified extended control register.

Description

This intrinsic writes the given value to the specified extended control register. Currently, the only control register allowed/defined is `(XCR0) XFEATURE_ENABLED_MASK` register. The corresponding constant is defined in the `immintrin.h` file to refer to this register:

```
#define _XCR_XFEATURE_ENABLED_MASK 0
```

This intrinsic maps to `XSETBV` instruction.

Intrinsics for Saving and Restoring the Extended Processor States

To use any of these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

Intrinsics that map to FXSAVE[64] and FXRSTOR[64] instructions

This group of intrinsics includes four intrinsics to save and restore the current state of the `x87 FPU`, `MMX`, `XMM`, and `MXCSR` registers.

These intrinsics accept a memory reference to a 16-byte aligned 512-byte memory chunk. The layout of the memory is shown below in Table 1.

Table 1 - `FXSAVE` save area layout.

15 14	13 12	11 10	9 8	7 6	5	4	3 2	1 0

Intrinsics that map to XSAVE[64], XSAVEOPT[64], and XRSTOR[64] instructions

This group of intrinsics includes six intrinsics to fully or partially save and restore the current state of the `x87 FPU`, `MMX`, `XMM`, `YMM`, and `MXCSR` registers.

These intrinsics accept a memory reference to a 64-byte aligned memory. The layout of the register fields for the first 512 bytes is the same as the `FXSAVE` save area layout. The intrinsics saving the states do not write to bytes 464:511. The save area layout is shown in Tables 2a and 2b below.

The second operand is a save/restore mask specifying the saved/restored extended states. The value of the mask is `AND`ed with `XFEATURE_ENABLED_MASK(XCR0)`. A particular extended state is saved/restored only if the corresponding bit of both save/restore mask and `XFEATURE_ENABLED_MASK` is set to '1'.

Table 2a - `XSAVE` save area layout (first 512 bytes)

31........28	27........24	23........20	19........16	15........12	11........8	7........4	3........0

YMM9[255:128]	YMM8[255:128]	128	704
YMM11[255:128]	YMM10[255:128]	160	736
YMM13[255:128]	YMM12[255:128]	192	768
YMM15[255:128]	YMM14[255:128]	224	800

_fxsave()

Saves the states of x87 FPU, MMX, XMM, and MXCSR registers to memory.

Syntax

```
extern void _fxsave(void *mem);
```

Arguments

mem	A memory reference to `FXSAVE` area. The 512-bytes memory addressed by the reference must be 16-bytes aligned.

Description

Saves the states of `x87 FPU`, `MMX`, `XMM`, and `MXCSR` registers to memory. This intrinsic maps to `FXSAVE` instruction.

_fxsave64()

Saves the states of x87 FPU, MMX, XMM, and MXCSR registers to memory.

Syntax

```
extern void _fxsave64(void *mem);
```

Arguments

mem	A memory reference to `FXSAVE` area. The 512-bytes memory addressed by the reference must be 16-bytes aligned.

Description

Saves the states of `x87 FPU`, `MMX`, `XMM`, and `MXCSR` registers to memory. This intrinsic maps to `FXSAVE64` instruction.

_fxrstor()

Restores the states of x87 FPU, MMX, XMM, and MXCSR registers from memory.

Syntax

```
extern void _fxrstor(void *mem);
```

Arguments

mem	A memory reference to `FXSAVE` area. The 512-bytes memory addressed by the reference must be 16-bytes aligned.

Description

Restores the states of `x87 FPU`, `MMX`, `XMM`, and `MXCSR` registers from memory. This intrinsic maps to `FXRSTOR` instruction.

_fxrstor64()

Restores the states of x87 FPU, MMX, XMM, and MXCSR registers from memory.

Syntax

```
extern void _fxrstor64(void *mem);
```

Arguments

mem	A memory reference to `FXSAVE` area. The 512-bytes memory addressed by the reference must be 16-bytes aligned.

Description

Restores the states of x87 FPU, MMX, XMM, and MXCSR registers from memory. This intrinsic maps to FXRSTOR64 instruction.

_xsave()/_xsavec()/_xsaves()

Saves the states of x87 FPU, MMX, XMM, YMM, and MXCSR registers to memory.

Syntax

```
extern void _xsave(void *mem, unsigned __int64 save_mask);
extern void _xsavec(void *mem, unsigned __int64 save_mask);
extern void _xsaves(void *mem, unsigned __int64 save_mask);
```

Arguments

mem	A memory reference to FXSAVE area. The 512-bytes memory addressed by the reference must be 16-bytes aligned.
save_mask	A bit mask specifying the extended states to be saved.

Description

Saves the states of x87 FPU, MMX, XMM, YMM, and MXCSR registers to memory. The xsave intrinsic maps to XSAVE instruction, the xsavec intrinsic maps to XSAVEC instruction, and the xsaves intrinsic maps to XSAVES instruction. See the Intel® 64 and IA-32 Architectures Software Developer's Manual for information on how the three instructions differ.

_xsave64()/ _xsavec64()/ _xsaves64()

Saves the states of x87 FPU, MMX, XMM, YMM, and MXCSR registers to memory.

Syntax

```
extern void _xsave64(void *mem, unsigned __int64 save_mask);
extern void _xsavec64(void *mem, unsigned __int64 save_mask);
extern void _xsaves64(void *mem, unsigned __int64 save_mask);
```

Arguments

mem	A memory reference to FXSAVE area. The 512-bytes memory addressed by the reference must be 16-bytes aligned.
save_mask	A bit mask specifying the extended states to be saved.

Description

Saves the states of x87 FPU, MMX, XMM, YMM, and MXCSR registers to memory. The xsave64 intrinsic maps to XSAVE64 instruction, the xsavec64 intrinsic maps to XSAVEC64 instruction, and the xsaves64 intrinsic maps to XSAVES64 instruction. See the Intel® 64 and IA-32 Architectures Software Developer's Manual for information on how the three instructions differ.

_xsaveopt()

Saves the states of x87 FPU, MMX, XMM, YMM, and MXCSR registers to memory, optimizing the save operation if possible.

Syntax

```
extern void _xsaveopt(void *mem, unsigned __int64 save_mask);
```

Arguments

mem	A memory reference to `FXSAVE` area. The 512-bytes memory addressed by the reference must be 16-bytes aligned.
save_mask	A bit mask specifying the extended states to be saved.

Description

Saves the states of `x87 FPU`, `MMX`, `XMM`, `YMM`, and `MXCSR` registers to memory, optimizing the save operation if possible. This intrinsic maps to `XSAVEOPT` instruction.

_xsaveopt64()

Saves the states of x87 FPU, MMX, XMM, YMM, and MXCSR registers to memory, optimizing the save operation if possible.

Syntax

```
extern void _xsaveopt64(void *mem, unsigned __int64 save_mask);
```

Arguments

mem	A memory reference to `FXSAVE` area. The 512-bytes memory addressed by the reference must be 16-bytes aligned.
save_mask	A bit mask specifying the extended states to be saved.

Description

Saves the states of `x87 FPU`, `MMX`, `XMM`, `YMM`, and `MXCSR` registers to memory, optimizing the save operation if possible. This intrinsic maps to `XSAVEOPT64` instruction.

_xrstor()/xrstors()

Restores the states of x87 FPU, MMX, XMM, YMM, and MXCSR registers from memory.

Syntax

```
extern void _xrstor(void *mem, unsigned __int64 rstor_mask);
```

```
extern void _xrstors(const void *mem, unsigned __int64 rstor_mask);
```

Arguments

mem	A memory reference to `FXSAVE` area. The 512-bytes memory addressed by the reference must be 16-bytes aligned.

rstor_mask	A bit mask specifying the extended states to be restored.

Description

Restores the states of `x87 FPU`, `MMX`, `XMM`, `YMM`, and `MXCSR` registers from memory. The `xrstor` intrinsic maps to `XRSTOR` instruction, and the `xrstors` intrinsic maps to `XRSTORS` instruction. See the Intel® 64 and IA-32 Architectures Software Developer's Manual for information on how the instructions differ.

_xrstor64()/xrstors64()

Restores the states of x87 FPU, MMX, XMM, YMM, and MXCSR registers from memory.

Syntax

```
extern void _xrstor64(void *mem, unsigned __int64 rstor_mask);
extern void _xrstors64(const void *mem, unsigned __int64 rstor_mask);
```

Arguments

mem	A memory reference to `FXSAVE` area. The 512-bytes memory addressed by the reference must be 16-bytes aligned.
rstor_mask	A bit mask specifying the extended states to be restored.

Description

Restores the states of `x87 FPU`, `MMX`, `XMM`, `YMM`, and `MXCSR` registers from memory. The `xrstor64` intrinsic maps to `XRSTOR64` instruction, and the `xrstors64` intrinsic maps to `XRSTORS64` instruction. See the Intel® 64 and IA-32 Architectures Software Developer's Manual for information on how the instructions differ.

Intrinsics for the Short Vector Random Number Generator Library

The Short Vector Random Number Generator (SVRNG) library provides intrinsics for the IA-32 and Intel® 64 architectures running on supported operating systems. The SVRNG library partially covers both standard C++ (as referenced here: http://www.cplusplus.com/reference/random/) and the random number generation functionality of the Intel® oneAPI Math Kernel Library (oneMKL). The SVRNG library allows users to produce random numbers using a combination of engines and distributions. Engines are basic generators which produce uniformly distributed 32-bit or 64-bit unsigned integer numbers. Distributions transform the sequences of numbers generated by an engine into sequences of numbers with specific random variable distributions, such as uniform, normal, binomial and others. The distributions support single- or double-precision floating point and 32-bit signed integer outputs.

Both scalar and vector implementations are available for SVRNG generation functions. Scalar versions return native C++ data types: float, double, and both 32- and 64-bit integers. Vector versions produce packed results using SIMD-vector registers via corresponding data types as outlined in Data Types and Calling Conventions. Scalar versions called in loops can be vectorized by the compiler.

Unlike simple random number generators such as `rand()`, SVRNG engines and distributions require initialization routines which allocate memory and pre-compute constants required for fast vector generation. Finalization routines are provided to deallocate memory. Some engines support skip-ahead and leap-frog techniques for use in parallel computing environment. The Parallel Computation Support section discusses how these are used to obtain a random number sequence in parallel that is identical to the random number sequence that is generated in the sequential case. Error handling in SVRNG is done via status set and get functions. Additionally NULL pointers are returned on errors when possible.

SVRNG SIMD-vector functions and corresponding vectorized scalar calls are highly optimized for the following instructions sets:

- Intel® Streaming SIMD Extensions 2 (Intel® SSE2) (default)
- Intel® Advanced Vector Extensions 2 (Intel® AVX2)
- Intel® Advanced Vector Extensions 512 (Intel® AVX-512) Instructions (on Intel® Many Integrated Core Architecture (Intel® MIC Architecture) and elsewhere)

Data Types and Calling Conventions

Data types specific to the Short Vector Random Number Generator (SVRNG) Library

There are two types of SVRNG functions: the initialization and service routines and generation functions. The initialization and service routines introduce two new data types:

svrng_engine_t	A pointer to the engine-specific data structure created by the engine initialization routine. The structure contains pre-computed constants necessary for fast and precise random number vector generation by the engine. The structure size is engine-dependent.
svrng_distribution_t	A pointer to the distribution-specific data structure created by the distribution initialization routine. The structure contains pre-computed loop invariant constants to perform distribution transformations efficiently. The structure size is distribution-dependent.

While scalar SVRNG generation functions return native "C" data types (*float, double, 32-bit and 64-bit integers*), the SIMD-vector versions produce 1 [1] , 2, 4, 8, 16, or 32 packed results in one or several SIMD-vector registers. A set of SVRNG-specific vector types have been introduced to return these packed results. These types are CPU-specific and mapped to different numbers of SIMD-registers depending on the architecture where the program runs:

Type name	Number of packed values	SSE2 (default)	AVX2[1]
		Unsigned 32-bit integer	
svrng_uint1_t	1	__m128i	__m128i

svrng_double8_t	8	struct { __m128d r[4]; }	struct { __m256d r[2]; }
svrng_double16_t	16	struct { __m128d r[8]; }	struct { __m256d r[4]; }
svrng_double32_t	32	struct { __m128d r[16]; }	struct { __m256d r[8]; }

[1] Note that SVRNG does not have optimizations specific to the Intel® Advanced Vector Extensions (Intel® AVX) instruction set. On hardware that supports Intel® AVX the Intel® Streaming SIMD Extensions 2 (Intel® SSE2) instruction default versions are called, so you must use the Intel® SSE2 data types to interpret the results.

SVRNG calling conventions

All SVRNG routines use the regcall calling convention which provides the most use of hardware vector registers for passing parameters and returning results. See the "C/C++ Calling Conventions" section and the "_vectorcall and __regcall demystified" article referenced in the Introduction. This avoids unnecessary memory spills and fills of registers and improves performance.

In addition this convention provides the opportunity to deploy the "vector variant" declaration feature specific to the Intel® compiler. The declaration specifies a vector variant function that corresponds to its original C/C++ scalar function. This vector variant function can be invoked in vector context at the site of the call. See the `vector_variant` section for more detail. All SIMD-vector SVRNG intrinsics (except packed length = 1) are declared in the `svrng.h` header file as vector_variant to support automatic vectorization.

vector_variant

Usage Model

A typical usage model for using the intrinsics in the Short Vector Random Number Generator (SVRNG) library is the same as for standard C++ or Intel® oneAPI Math Kernel Library (oneMKL) vector statistics random number generator and looks something like the following:

- Include `svrng.h` header file
- Create and initialize basic SVRNG generator engine, create and initialize distribution (if necessary).
- Call one or more SVRNG generation function.
- Process the output.
- Delete the SVRNG engines and distributions.

On Windows*, users will need to explicitly link the static or dynamic libraries: static: `libirng.lib`, dynamic: `libirngmd.lib`. On Linux* and macOS the compiler driver will link automatically.

The following example demonstrates generation of a random stream that is output of basic generator engine MT19937 with seed equal to 777. The engine is used to generate two arrays: 1024 uniformly distributed random numbers between <a = 0.0, b = 4.0> via scalar generator call which should be vectorized by the compiler and 1024 normally distributed with parameters <mean = 2.0, standard deviation = 1.0> random numbers in blocks by 16 elements via direct call of SIMD-vector implementation. Delete engines and distributions after completing the generation. Check status for possible errors happened. The purpose of the example is to calculate the sample mean for both distributions with the given parameters.

```
#include <stdio.h>
#include <svrng.h>

int main( void )
{
  int                    i, st = SVRNG_STATUS_OK;
  double                 res1[1024],  res2[1024];
  double                 sum1 = 0, sum2 = 0;
  double                 mean1, mean2;
  svrng_engine_t         engine;
  svrng_distribution_t   distr1, distr2;
```

```
    /* Create mt19937 engine */
    engine = svrng_new_mt19937_engine( 777 );

    /* Create uniform distribution */
    distr1 = svrng_new_uniform_distribution_double( 0.0, 4.0 );

    /* Create normal distribution */
    distr2 = svrng_new_normal_distribution_double( 2.0, 1.0 );

    /* Scalar generator call, can be vectorized by compiler */
    #pragma ivdep
    #pragma vector always
    for( i = 0; i < 1024; i ++ ) {
        res1[i] = svrng_generate_double( engine, distr1 );
    }

    /* Direct call to SIMD-vector implementation */
    /* generating 16 packed elements */
    for( i = 0; i < 1024; i += 16 ) {
        *((svrng_double16_t*)(&res2[i])) =
        svrng_generate16_double( engine, distr2 );
    }

    /* Compute mean values */
    for( i = 0; i < 1024; i++ ) {
        sum1 += res1[i];
        sum2 += res2[i];
    }

    mean1 = sum1 / 1024.0;
    mean2 = sum2 / 1024.0;

    /* Printing results */
    printf( "Sample mean of uniform distribution = %f\n", mean1 );
    printf( "Sample mean of normal  distribution = %f\n", mean2 );

    /* Check for resulted status */
    st = svrng_get_status();

    if(st != SVRNG_STATUS_OK) {
        printf("FAILED: status error %d returned\n", st);
    }

    /* Delete distributions */
    svrng_delete_distribution( distr1 );
    svrng_delete_distribution( distr2 );

    /* Delete engine */
    svrng_delete_engine( engine );

return st;
}
```

Another example demonstrates the "skip-ahead" technique which ensures identical random number sequences in cases of parallel and sequential generation for certain engines. The rand0 engine is being created and copied to T "threads" with the "skip-ahead" adjustments applied. Each "thread" generates N uniformly distributed unsigned integer random values and then all LEN=T*N numbers are compared to the sequential call:

```
#include <stdio.h>
#include <stdint.h>
#include <svrng.h>

#define LEN        1024
#define T          8
#define N          (LEN/T)

int main( void ) {
  uint32_t       seq_res[LEN+32], parallel_res[LEN+32];
  svrng_engine_t seq_engine;
  svrng_engine_t parallel_engine[T];
  int            l, n, t, errs = 0, st = SVRNG_STATUS_OK;

    /* Create sequential engine and distr */
    seq_engine = svrng_new_rand0_engine( 777 );

    /* Copy existing sequential engine to new T parallel ones */
    /* with t*N offsets using skipahead method */
    for( t = 0; t < T; t++ ) {
        int thr_offset = t*N;
        parallel_engine[t] = svrng_copy_engine( seq_engine );
        parallel_engine[t] = \
          svrng_skipahead_engine( parallel_engine[t], thr_offset );
    }

    /* Sequential loop using scalar function (can be vectorized) */
    #pragma ivdep
    #pragma vector always
    for( l = 0; l < LEN; l++ ) {
        seq_res[l] = svrng_generate_uint( seq_engine );
    }

    /* Parallel loop using SIMD-vector function, */
    /* may be spreaded by threads */
    for( t = 0; t < T; t++ ) {
        for( n = 0; n < N; n += 8 ) {
            *((svrng_uint8_t*)(&(parallel_res[t*N+n]))) = \
            svrng_generate8_uint( parallel_engine[t] );
        }
    }

    /* Compare seq and parallel results */
    for(l = 0; l < LEN; l++) {
        if( parallel_res[l] != seq_res[l]) {
            errs++;
        }
    }

    /* Check for resulted status */
    st = svrng_get_status();
```

```
    /* Print overall result */
    if(st != SVRNG_STATUS_OK) {
        printf("FAILED: status error %d returned\n", st);
    }
    else if(errs) {
        printf("FAILED: %d skipahead errors\n",  errs);
    }
    else {
        printf("PASSED\n");
    }

    /* Delete engines */
    svrng_delete_engine( seq_engine );
    for( t = 0; t < T; t++ ) {
        svrng_delete_engine(parallel_engine[t]);
    }

  return (errs-st);
}
```

Engine Initialization and Finalization

Unlike the simple `rand()` function, vector random number generators in the Short Vector Random Number Generator (SVRNG) library require the initialization of an engine before the first generator run. This is due to the fact that a number of initialization values called the vector state of the engine must be pre-computed to perform effective vector generation. Once computed that vector state is retained and updated in memory as more numbers are generated. When no more random numbers are needed, that memory can be deallocated. The next few topics provide the functions used to allocate memory, initialize, and deallocate memory for all supported SVRNG engines.

The SVRNG library supports the following engines from the C++11 standard and the Intel® oneAPI Math Kernel Library (oneMKL) vector statistics random number generator collection:

- **rand0** (C++11 standard)
- **rand** (C++11 standard)
- **mcg31m1** (oneMKL)
- **mcg59** (oneMKL)
- **mt19937** (oneMKL and C++11 standard)

For more information on the figures of merit for these random number generator engines read the Basic Random Generator Properties and Testing Results section of the *Notes for Intel® oneAPI Math Kernel Library Vector Statistics* document (see the introduction).

For each engine there is a simple and extended version of the initialization function. Simple initialization has one parameter, the seed, and constructs the rest of the vector state to generate the proper sequence for the engine type. The extended versions of the initialization functions, with the `_ex` suffix, use multiple constants to set generator state values. The application notes in the description of each engine provide more detail on how these constants are used. The usual case for extended initialization requires enough constants to fill a SIMD register with 64-bit values on the system which the program is intended to run. The following table sums up the width (`SIMD_WIDTH`) of the SIMD registers used by the instructions sets for which the SVRNG intrinsics are optimized:

Instruction set	***SIMD_WIDTH***
Intel® Streaming SIMD Extensions 2 (Intel® SSE2)	2

Instruction set	***SIMD_WIDTH***
Intel® Advanced Vector Extensions 2 (Intel® AVX2)	4
Intel® Advanced Vector Extensions 512 (Intel® AVX-512)	8

Introduction

svrng_new_rand0_engine/svrng_new_rand0_ex

Routines for allocating memory for a rand0 engine and initializing with one or multiple seeds

Syntax

`svrng_engine_t svrng_new_rand0_engine( uint32_t seed )`

`svrng_engine_t svrng_new_rand0_engine_ex( int num, uint32_t *pseed )`

Input Parameters

seed	Initial condition for the engine.
num	Number of initialization values for the extended routine. May be 0 (*seed* set to 1), 1 (*seed* set to *pseed[0]*), or `SIMD_WIDTH`.
pseed	Pointer to an array with initialization values for the extended routine.

Description

The `svrng_new_rand0_engine` function allocates memory for the rand0 engine originated from C++11 standard and initializes it using one *seed* value. The extended version of the function, `svrng_new_rand0_engine_ex`, accepts several values for complex initialization cases where the user needs to fill the whole vector state with their own constants.

Status flags set

Name	**Description**
SVRNG_STATUS_ERROR_MEMORY_ALLOC	Memory allocation failure
SVRNG_STATUS_ERROR_BAD_PARAM1	Bad parameter: `num`
SVRNG_STATUS_ERROR_BAD_PARAM2	Bad parameter: `pseed`

Return Values

A pointer to an initialized engine or NULL on error.

Application Notes

The rand0 engine is a simple 32-bit multiplicative congruential pseudo-random number generator represented by formula:

$x_{i+1} = (a*x_i) \bmod m$

multiplier *a* = *16807 (=7^5)*

modulus *m* = *2147483647 (=2^{31}-1)*

Range: [0,MAX), where MAX = m

svrng_new_rand_engine/svrng_new_rand_ex

Routines for allocating memory for a rand engine and initializing with one or multiple seeds

Syntax

```
svrng_engine_t svrng_new_rand_engine( uint32_t seed )
```

```
svrng_engine_t svrng_new_rand_engine_ex( int num, uint32_t *pseed )
```

Input Parameters

seed	Initial condition for the engine.
num	Number of initialization values for the extended routine. May be 0 (*seed* set to 1), 1 (*seed* set to *pseed[0]*), or `SIMD_WIDTH`.
pseed	Pointer to an array with initialization values for the extended routine.

Description

The `svrng_new_rand_engine` function allocates memory for the rand engine (originated from C++ 11 standard) and initializes it using one *seed* value. The extended version of the function, `svrng_new_rand_engine_ex`, accepts several values for complex initialization cases where the user needs to fill the whole vector state with their own constants.

Status flags set

Name	Description
SVRNG_STATUS_ERROR_MEMORY_ALLOC	Memory allocation failure
SVRNG_STATUS_ERROR_BAD_PARAM1	Bad parameter: `num`
SVRNG_STATUS_ERROR_BAD_PARAM2	Bad parameter: `pseed`

Return Values

A pointer to an initialized engine or NULL on error.

Application Notes

The rand is a simple 32-bit multiplicative congruential pseudo-random number generator represented by formula:

$x_{i+1} = (a*x_i) \bmod m$

multiplier *a* = *48271*

modulus *m* = *2147483647 (=2^{31}-1)*

Range: [0,MAX), where MAX = m

svrng_new_mcg31m1_engine/svrng_new_mcg31m1_ex

Routines for allocating memory for a mcg31m1 engine and initializing with one or multiple seeds

Syntax

```
svrng_engine_t svrng_new_mcg31m1_engine( uint32_t seed )
```

```
svrng_engine_t svrng_new_mcg31m1_engine_ex( int num, uint32_t *pseed )
```

Input Parameters

seed	Initial condition for the engine.
num	Number of initialization values for the extended routine. May be 0 (*seed* set to 1), 1 (*seed* set to *pseed[0]*), or `SIMD_WIDTH`.
pseed	Pointer to an array with initialization values for the extended routine.

Description

The `svrng_new_mcg31m1_engine` function allocates memory for the mcg31m1 engine (originated from C++ 11 standard) and initializes it using one *seed* value. The extended version of the function, `svrng_new_mcg31m1_engine_ex`, accepts several values for complex initialization cases where the user needs to fill the whole vector state with their own constants.

Status flags set

Name	Description
SVRNG_STATUS_ERROR_MEMORY_ALLOC	Memory allocation failure
SVRNG_STATUS_ERROR_BAD_PARAM1	Bad parameter: `num`
SVRNG_STATUS_ERROR_BAD_PARAM2	Bad parameter: `pseed`

Return Values

A pointer to an initialized engine or NULL on error.

Application Notes

The mcg31m1 is a simple 32-bit multiplicative congruential pseudo-random number generator represented by formula:

$x_{i+1} = (a*x_i) \bmod m$

multiplier $a = 1132489760$

modulus $m = 2147483647$ $(=2^{31}-1)$ Range: [0,MAX), where MAX = m

svrng_new_mcg59_engine/svrng_new_mcg59_ex

Routines for allocating memory for a mcg59 engine and initializing with one or multiple seeds

Syntax

`svrng_engine_t svrng_new_mcg59_engine( uint32_t seed )`

`svrng_engine_t svrng_new_mcg59_engine_ex( int num, uint32_t *pseed )`

Input Parameters

seed	Initial condition for the engine.
num	Number of initialization values for the extended routine. May be 0 (*seed* set to 1), 1 (*seed* set to *pseed[0]*), or `SIMD_WIDTH`.
pseed	Pointer to an array with initialization values for the extended routine.

Description

The `svrng_new_mcg59_engine` function allocates memory for the mcg59 engine (originated from C++ 11 standard) and initializes it using one *seed* value. The extended version of the function, `svrng_new_mcg59_engine_ex`, accepts several values for complex initialization cases where the user needs to fill the whole vector state with their own constants.

Status flags set

Name	Description
SVRNG_STATUS_ERROR_MEMORY_ALLOC	Memory allocation failure
SVRNG_STATUS_ERROR_BAD_PARAM1	Bad parameter: `num`
SVRNG_STATUS_ERROR_BAD_PARAM2	Bad parameter: `pseed`

Return Values

A pointer to an initialized engine or NULL on error.

Application Notes

The mcg59 is a simple 64-bit multiplicative congruential pseudo-random number generator represented by formula:

$x_{i+1} = (a*x_i) \bmod m$

multiplier $a = 13^{13}$

modulus $m = 2^{59}$ Range: [0,MAX), where MAX = m

svrng_new_mt19937_engine/svrng_new_mt19937_ex

Routines for allocating memory for an mt19937 engine and initializing with one or multiple seeds

Syntax

`svrng_engine_t svrng_new_mt19937_engine( uint32_t seed )`

`svrng_engine_t svrng_new_mt19937_engine_ex( int num, uint32_t *pseed )`

Input Parameters

seed	Initial condition for the engine.
num	Number of initialization values for the extended routine. `num`>=0. See VSL Notes for further details on extended initialization of the mt19937 engine.
pseed	Pointer to an array with initialization values for the extended routine.

Description

The `svrng_new_mt19937_engine` function allocates memory for the mt19937 engine (from C++ 11 standard) and initializes it using one *seed* value. The extended version of the function, `svrng_new_mt19937_engine_ex`, accepts several values for complex initialization cases. Because the mt19937 engine has 19937 bits of state in memory, its initialization differs from the other engines. See the *Notes for Intel® oneAPI Math Kernel Library Vector Statistics* document for detailed information on this engine.

Status flags set

Name	Description
SVRNG_STATUS_ERROR_MEMORY_ALLOC	Memory allocation failure
SVRNG_STATUS_ERROR_BAD_PARAM1	Bad parameter: `num`
SVRNG_STATUS_ERROR_BAD_PARAM2	Bad parameter: `pseed`

Return Values

A pointer to an initialized engine or NULL on error.

Application Notes

The mt19937 is a Mersenne Twister pseudo-random generator of 32-bit numbers with a state size of 19937 bits that is a modification of twisted generalized feedback shift register generator. Range: [0,MAX), where MAX = 2^{32}.

Introduction

svrng_delete_engine

Deallocates memory for the specified engine

Syntax

```
svrng_engine_t svrng_delete_engine( svrng_engine_t engine )
```

Input Parameters

engine	Pointer to the engine to be deallocated.

Description

The `svrng_delete_engine` function deallocates memory for the specified engine.

Status flags set

Name	Description
SVRNG_STATUS_ERROR_BAD_ENGINE	Bad engine (NULL pointer)

Return Values

NULL pointer.

Distribution Initialization and Finalization

The Short Vector Random Number Generator (SVRNG) library supports the following distributions:

- **uniform** (*single and double floating point and 32-bit integer*)
- **normal** (*single and double floating point*)

SVRNG distributions must be initialized before random numbers can be generated. The initialization and finalization routines in this section allocate memory, pre-compute loop-invariant values and broadcast scalar constants for fast vector generation. Update functions are also provided to re-compute these numbers without memory re-allocation. More detail on the figures of merit for these distributions can be found in the Figures of Merit for Random Number Generators and Testing of Distribution Random Number Generators sections of the *Notes for Intel® oneAPI Math Kernel Library Vector Statistics* document referenced in the Introduction.

See Also

Introduction

svrng_new_uniform_distribution_[int|float|double]/svrng_update_uniform_distribution_[int|float|double]

Allocates and initializes constants for the uniform distribution with specified parameters

Syntax

```
svrng_distribution_t svrng_new_uniform_distribution_int( int a, int b )

svrng_distribution_t svrng_new_uniform_distribution_float( float a, float b )

svrng_distribution_t svrng_new_uniform_distribution_double( double a, double b )

svrng_distribution_t svrng_update_uniform_distribution_int( svrng_distribution_t distr,
int a, int b )

svrng_distribution_t svrng_update_uniform_distribution_float( svrng_distribution_t
distr, float a, float b )

svrng_distribution_t svrng_update_uniform_distribution_double( svrng_distribution_t
distr, double a, double b )
```

Input Parameters

a	Left bound of interval
b	Right bound of interval
distr	Pointer to the distribution to be updated

Description

The **svrng_new_uniform_distribution_[int|float|double]** function allocates memory for a uniform distribution and pre-computes and broadcasts loop-invariant constants required for vector generation of uniformly distributed values over the interval [a, b), where a, b are the real left and right bounds of the interval respectively with a < b. 32-bit `int`, `float` and `double` types are supported. The **svrng_update_uniform_distribution_[int|float|double]** functions give the same result, but by modifying existing distributions instead of allocating memory for new distributions.

Status flags set

Name	Description
SVRNG_STATUS_ERROR_MEMORY_ALLOC	Memory allocation failure
SVRNG_STATUS_ERROR_BAD_PARAMS	`a>=b`
SVRNG_STATUS_ERROR_BAD_DISTR	Bad distribution (NULL pointer)

Return Values

A pointer to the distribution created or updated by the function, or NULL on error.

svrng_new_normal_distribution_[float|double]/svrng_update_normal_distribution_[float|double]

Allocates and initializes constants for the normal distribution with specified parameters

Syntax

`svrng_distribution_t svrng_new_normal_distribution_float( float mean, float stddev )`

`svrng_distribution_t svrng_new_normal_distribution_double( double mean, double stddev )`

`svrng_distribution_t svrng_update_normal_distribution_float( svrng_distribution_t distr, float mean, float stddev )`

`svrng_distribution_t svrng_update_normal_distribution_double( svrng_distribution_t distr, double mean, double stddev )`

Input Parameters

mean	Mean value of the normal distribution.
stddev	Standard deviation of the normal distribution
distr	Pointer to the distribution to be updated

Description

The **svrng_new_normal_distribution_[float|double]** functions allocate memory for a normal distribution of either 32- or 64-bit floating pont numbers with the specified `mean` and positive, real `stddev` using the ICDF method. The function pre-computes and broadcasts loop-invariant constants required for vector generation. The **svrng_update_normal_distribution_[float|double]** functions give the same result, but by modifying existing distributions instead of allocating memory for new distributions.

Status flags set

Name	Description
SVRNG_STATUS_ERROR_MEMORY_ALLOC	Memory allocation failure
SVRNG_STATUS_ERROR_BAD_PARAM2	Bad parameter: `stddev`
SVRNG_STATUS_ERROR_BAD_DISTR	Bad distribution (NULL pointer)

Return Values

A pointer to the distribution created or updated by the function, or NULL on error.

svrng_delete_distribution

Deallocates memory for the specified distribution

Syntax

```
svrng_distribution_t svrng_delete_distribution( svrng_distribution_t distr)
```

Input Parameters

distr	Pointer to the distribution to be deallocated.

Description

The **svrng_delete_distribution** function deallocates memory for the specified distribution.

Status flags set

Name	Description
SVRNG_STATUS_ERROR_BAD_DISTR	`distr` is a NULL pointer.

Return Values

NULL pointer.

Random Values Generation

Once the engines and distributions are created by the appropriate initialization routines, the SVRNG generation functions may be called. Both scalar and vector implementations are available. Scalar functions return random values of native "C" types such as `int32_t`, `uint32_t`, `uint64_t`, `float`, and `double`, while vector functions produce packed results in SIMD registers through CPU-specific types (see the "Data Types and Calling Conventions" sections). Calls to scalar SVRNG intrinsics in loops can be vectorized by the compiler via the "vector_variant" feature when the `svrng.h` header file is used. The compiler vectorizer replaces scalar calls by a corresponding SIMD version.

See Also

Data Types and Calling Conventions

svrng_generate[1|2|4|8|16|32]_[uint|ulong]

Generates uniform random bits over the a specified range

Syntax

```
uint32_t svrng_generate_uint( svrng_engine_t engine )
svrng_uint1_t svrng_generate1_uint( svrng_engine_t engine )
svrng_uint2_t svrng_generate2_uint( svrng_engine_t engine )
svrng_uint4_t svrng_generate4_uint( svrng_engine_t engine )
svrng_uint8_t svrng_generate8_uint( svrng_engine_t engine )
svrng_uint16_t svrng_generate16_uint( svrng_engine_t engine )
svrng_uint32_t svrng_generate32_uint( svrng_engine_t engine )
uint64_t svrng_generate_ulong( svrng_engine_t engine )
svrng_ulong1_t svrng_generate1_ulong( svrng_engine_t engine )
svrng_ulong2_t svrng_generate2_ulong( svrng_engine_t engine )
svrng_ulong4_t svrng_generate4_ulong( svrng_engine_t engine )
svrng_ulong8_t svrng_generate8_ulong( svrng_engine_t engine )
svrng_ulong16_t svrng_generate16_ulong( svrng_engine_t engine )
svrng_ulong32_t svrng_generate32_ulong( svrng_engine_t engine )
```

Input Parameters

engine	Pointer to the engine.

Description

The `svrng_generate[n]_[uint|ulong]` functions generate uniform random bits over the range [0, MAX) with engine-dependent maximum value. The uint versions are available for 32-bit engines only (rand0, rand, mcg31m1, mt19937), the ulong versions are available for 64-bit engines only (mcg59). The number `n` if specified expresses the number of packed unsigned integer elements in returned SIMD registers.

Status flags set

Name	**Description**
SVRNG_STATUS_ERROR_UNSUPPORTED	Unmatched engine and result type. See the Description section for supported combinations.
SVRNG_STATUS_ERROR_BAD_ENGINE	Bad engine (NULL pointer)

Return Values

Unsigned integer random value(s). The `svrng_generate_[uint|ulong]` functions return a single unsigned 32- or 64-bit integer random value. The `svrng_generate[n]_[uint|ulong]` functions, for n=1, 2, 4, 8, 16, or 32 return as many unsigned, 32- or 64-bit integer random values packed in a SIMD register.

svrng_generate[1|2|4|8|16|32]_[int|float|double]

Generates distributed random values for the specified engine and distribution

Syntax

`int32_t svrng_generate_int( svrng_engine_t` *`engine`*`, svrng_distribution_t` *`distr`* `)`

`svrng_int1_t svrng_generate1_int( svrng_engine_t` *`engine`*`, svrng_distribution_t` *`distr`* `)`

`svrng_int2_t svrng_generate2_int( svrng_engine_t` *`engine`*`, svrng_distribution_t` *`distr`* `)`

`svrng_int4_t svrng_generate4_int( svrng_engine_t` *`engine`*`, svrng_distribution_t` *`distr`* `)`

`svrng_int8_t svrng_generate8_int( svrng_engine_t` *`engine`*`, svrng_distribution_t` *`distr`* `)`

`svrng_int16_t svrng_generate16_int( svrng_engine_t` *`engine`*`, svrng_distribution_t` *`distr`* `)`

`svrng_int32_t svrng_generate32_int( svrng_engine_t` *`engine`*`, svrng_distribution_t` *`distr`* `)`

`float svrng_generate_float( svrng_engine_t` *`engine`*`, svrng_distribution_t` *`distr`* `)`

`svrng_double16_t svrng_generate16_double( svrng_engine_t` *`engine`*`, svrng_distribution_t` *`distr`* `)`

`svrng_double32_t svrng_generate32_double( svrng_engine_t` *`engine`*`, svrng_distribution_t` *`distr`* `)`

Input Parameters

`engine`	Pointer to the engine.

distr	Pointer to the distribution.

Description

The **svrng_generate[n]_[int|float|double]** functions generate distributed random values based on the input engine and distribution specified. The output types that are supported—int, float, or double—depend on the distribution used. The number `n` if specified expresses the number of packed elements desired in the returned SIMD registers.

Status flags set

Name	Description
SVRNG_STATUS_ERROR_UNSUPPORTED	Unmatched engine and result type. See the Description section for supported combinations.
SVRNG_STATUS_ERROR_BAD_ENGINE	Bad engine (NULL pointer)
SVRNG_STATUS_ERROR_BAD_DISTR	Bad distribution (NULL pointer)

Return Values

The `svrng_generate_[int|long|double]` functions return a single random value of the specified type. The `svrng_generate[n]_[int|long|double]` functions, for n=1, 2, 4, 8, 16, or 32, return as many signed random values packed in a SIMD register.

Service Routines

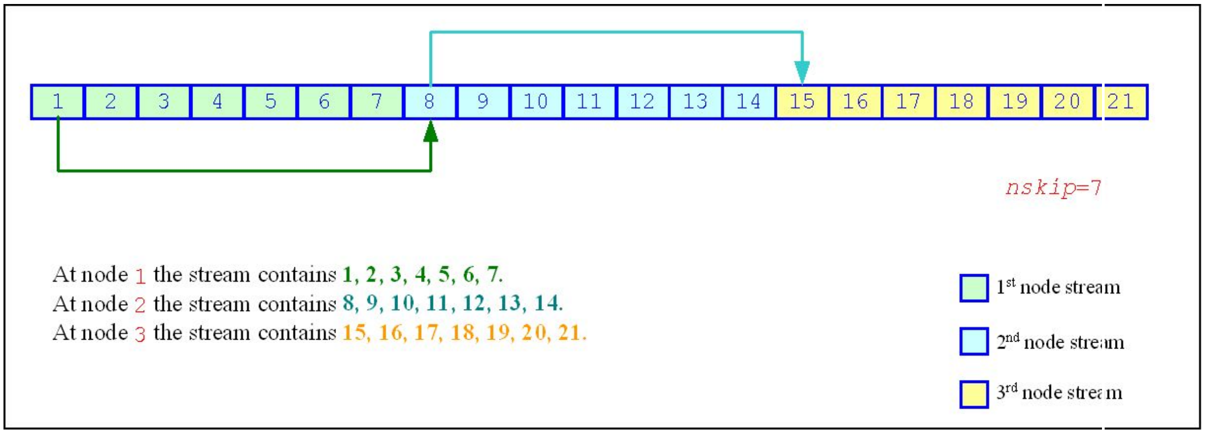
There are two types of service routines available to support the short vector random number generator library:

1. Functions for parallel computations
2. Error handling functions

Parallel Computation Support

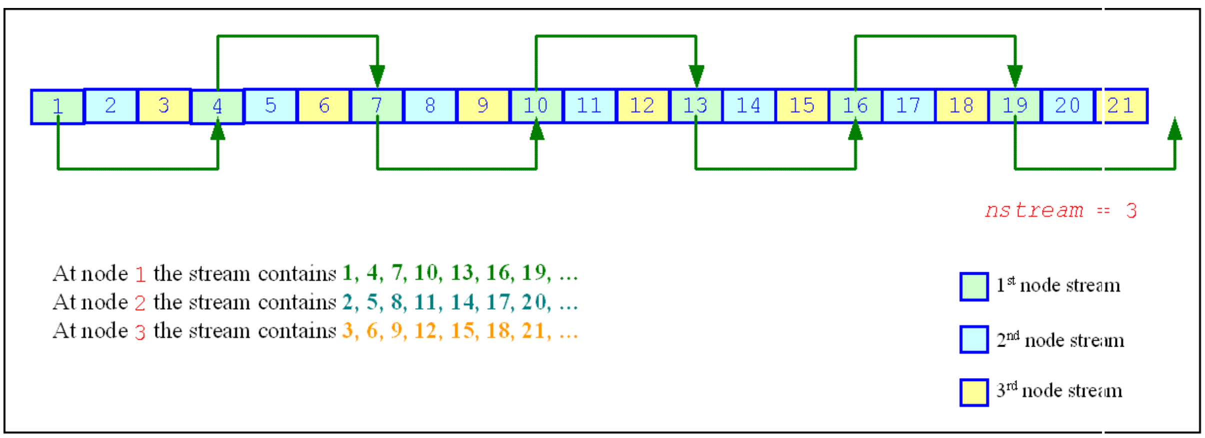
One of the basic requirements for the random number sequences generated by the engines is their mutual independence and lack of inter-correlation. Even if you want random number samplings to be correlated, such correlation should be controllable. The Short Vector Random Number Generator (SVRNG) library provides two techniques: skip-ahead and leap-frog.

Skip-ahead	The skip-ahead method splits the original sequence into *k* non-overlapping blocks, where *k* is the number of independent sequences. Each of the sequences generates random numbers only from the corresponding block of contiguous random numbers.



Leap-frog

The leap-frog method splits the original sequence into *k* disjoint subsequences in such a way that the first stream would generate the random numbers x_1, x_{k+1}, x_{2k+1}, x_{3k+1}, ..., the second stream would generate the random numbers x_2, x_{k+2}, x_{2k+2}, x_{3k+2}, ..., and, finally, the *k*-th stream would generate the random numbers x_k, x_{2k}, x_{3k}, ... The multi-dimensional uniformity properties of each subsequence deteriorate seriously as *k* grows so this method is only useful if *k* is less than about 25.



The following sequence outlines the typical usage model for creating independent sequences of random numbers in a parallel computation environment:

- Create the original engine
- Create a copy of the original engine in each thread
- Apply one of techniques above to re-initialize the individual engines to provide an independent sequence on each thread

For detailed information on the use of SVRNG intrinsics in a parallel computation environment see the Random Streams and RNGs in Parallel Computation section of the *Notes for Intel® oneAPI Math Kernel Library Vector Statistics* document listed in Intrinsics for the Short Vector Random Number Generator Library.

Note: Currently skip-ahead and leap-frog methods are supported by the rand0, rand, mcg31m1, and mcg59 engines. The skip-ahead and leap-frog methods of splitting a stream are not yet implemented for the ***mt19937*** *engine, but* ***mt19937*** *naturally provides parallel support during initialization. See the MT19937 section of the Notes for Intel® oneAPI Math Kernel Library Vector Statistics document listed in the introduction. .*

Intrinsics for the Short Vector Random Number Generator Library

svrng_copy_engine

Allocates memory for a new engine and copies over all parameters

Syntax

```
svrng_engine_t svrng_copy_engine( svrng_engine_t orig_engine )
```

Input Parameters

orig_engine	Pointer to the engine to be copied

Description

The `svrng_copy_engine` function allocates memory for a new engine then copies all parameters from original engine to the new engine.

Status flags set

Name	Description
SVRNG_STATUS_ERROR_MEMORY_ALLOC	Memory allocation failure
SVRNG_STATUS_ERROR_BAD_ENGINE	Bad engine (NULL pointer)

Return Values

Pointer to the newly created copy of the original engine, or NULL on error.

svrng_skipahead_engine

Re-initialize engine parameters for use of the skip-ahead method

Syntax

```
svrng_engine_t svrng_skipahead_engine( svrng_engine_t orig_engine, long long nskip )
```

Input Parameters

orig_engine	Pointer to the engine to be re-initialized using the skip-ahead technique
nskip	Number of skipped elements

Description

Re-initializes engine parameters using the block-splitting ("skip-ahead") method. The function skips a given number of elements in a random stream. This feature is particularly useful in distributing random numbers from original random stream across different computational nodes. If the largest number of random numbers used by a computational node is `nskip`, then the original random sequence may be split by this function into non-overlapping blocks of `nskip` size so that each block corresponds to the respective computational node. The number of computational nodes is unlimited.

Status flags set

Name	Description
SVRNG_STATUS_ERROR_NON_SUPPORTED	Memory allocation procedure failure
SVRNG_STATUS_ERROR_BAD_ENGINE	Bad engine (NULL pointer)
SVRNG_STATUS_ERROR_BAD_PARAM2	Bad parameter: `nskip`

Return Values

Pointer to the same input engine or NULL on error

svrng_leapfrog_engine

Re-initialize engine parameters for use of the leap-frog method

Syntax

```
svrng_engine_t svrng_leapfrog_engine( svrng_engine_t orig_engine, int k, int nstreams )
```

Input Parameters

orig_engine	Pointer to the engine to be re-initialized using the leap-frog technique.
k	Index of the computational node, or sequence number.
nstreams	Largest number of computational nodes, or stride.

Description

The `svrng_skipahead_engine` function re-initializes the engine parameters using the leap-frog method. The leap-frogged engine generates random numbers in a random stream with non-unit stride. This feature is particularly useful in distributing random numbers from the original stream across the *nstreams* buffers without generating the original random sequence with subsequent manual distribution.

Status flags set

Name	Description
SVRNG_STATUS_ERROR_UNSUPPORTED	Function or method non supported
SVRNG_STATUS_ERROR_BAD_ENGINE	Bad engine (NULL pointer)
SVRNG_STATUS_ERROR_BAD_PARAM2	Bad parameter: `k`
SVRNG_STATUS_ERROR_BAD_PARAM3	Bad parameter: `nstreams`

Return Values

Pointer to the same input engine or NULL on error

Error Handling

The Short Vector Random Number Generator (SVRNG) library supports error handling via status variables and corresponding set and get functions. NULL pointers are returned for errors when possible. The following table contains the status constants defined in `svrng.h`:

Macro Name	Description
SVRNG_STATUS_OK	No errors
SVRNG_STATUS_ERROR_BAD_PARAM1	Bad parameter #1
SVRNG_STATUS_ERROR_BAD_PARAM2	Bad parameter #2
SVRNG_STATUS_ERROR_BAD_PARAM3	Bad parameter #3
SVRNG_STATUS_ERROR_BAD_PARAM4	Bad parameter #4
SVRNG_STATUS_ERROR_BAD_PARAMS	Bad combination of parameters
SVRNG_STATUS_ERROR_BAD_ENGINE	Bad engine (NULL pointer)
SVRNG_STATUS_ERROR_BAD_DISTR	Bad distribution (NULL pointer)
SVRNG_STATUS_ERROR_MEMORY_ALLOC	Memory allocation failure
SVRNG_STATUS_ERROR_UNSUPPORTED	Function or method not supported

svrng_set_status

Sets the status variable to a specified value and returns the previous status value

Syntax

```
int32_t svrng_set_status( int32_t new_status )
```

Input Parameters

new_status	The new status.

Description

The `svrng_set_status` function sets the status variable to a specific constant value and returns the previous status value. See the Error Handling page for a table of values defined in `svrng.h`.

Return Values

Returns the previous status value.

svrng_get_status

Returns the current status value

Syntax

`int32_t svrng_get_status()`

Description

The `svrng_get_status` function returns the current status value.

Return Values

The current status value.

Intrinsics for Instruction Set Architecture (ISA) Instructions

SERIALIZE

_serialize

Synopsis

```
void _serialize ()
```

Header file	#include <immintrin.h>
Instruction	SERIALIZE
CPUID flags	SERIALIZE

Description

Serialize instruction execution, ensuring all modifications to flags, registers, and memory by previous instructions are completed before the next instruction is fetched.

Technology

Other

Category

TSXLDTRK

_xresldtrk

Synopsis

```
void _xresldtrk ()
```

Header file	#include <immintrin.h>
Instruction	XRESLDTRK
CPUID flags	TSXLDTRK

Description

Mark the end of a TSX (HLE/RTM) suspend load address tracking region. If this is used inside a suspend load address tracking region it will end the suspend region and all following load addresses will be added to the transaction read set. If this is used inside an active transaction but not in a suspend region it will cause transaction abort. If this is used outside of a transactional region it behaves like a NOP.

Technology

Category

Miscellaneous

_xsusldtrk

Synopsis

```
void _xsusldtrk ()
```

Header file	`#include <immintrin.h>`
Instruction	`XSUSLDTRK`
CPUID flags	`TSXLDTRK`

Description

Mark the start of a TSX (HLE/RTM) suspend load address tracking region. If this is used inside a transactional region, subsequent loads are not added to the read set of the transaction. If this is used inside a suspend load address tracking region it will cause transaction abort. If this is used outside of a transactional region it behaves like a NOP.

Intrinsics for Intel® Advanced Matrix Extensions (Intel(R) AMX) Instructions

Intel® Advanced Matrix Extensions (Intel® AMX) is a new 64-bit programming paradigm consisting of two components:

- A set of 2-dimensional registers (tiles) representing sub-arrays from a larger 2-dimensional memory image
- An accelerator that is able to operate on tiles; the first implementation of this accelerator is called TMUL (tile matrix multiply unit).

The following sections show intrinsics that are available for Intel(R) Advanced Matrix Extension Instructions.

Intrinsic for Intel® Advanced Matrix Extensions AMX-BF16 Instructions

This intrinsic supports tile computational operations on bfloat16 numbers.

_tile_dpbf16ps

Synopsis

```
void _tile_dpbf16ps (__tile dst, __tile a, __tile b)
```

Type	TileFloating Point
Header file	`#include <immintrin.h>`
Instruction	`TDPBF16PS tmm, tmm, tmm`
CPUID flags	`AMXBF16`

Description

Compute dot-product of BF16 (16-bit) floating-point pairs in tiles "a" and "b", accumulating the intermediate single-precision (32-bit) floating-point elements with elements in "dst", and store the 32-bit result back to tile "dst".

Technology

AMX

Category

Application-Targeted

Operation

```
FOR m := 0 TO dst.rows - 1
    tmp := dst.row[m]
    FOR k := 0 TO (a.colsb / 4) - 1
        FOR n := 0 TO (dst.colsb / 4) - 1
            tmp.fp32[n] += FP32(a.row[m].bf16[2*k+0]) * FP32(b.row[k].bf16[2*n+0])
            tmp.fp32[n] += FP32(a.row[m].bf16[2*k+1]) * FP32(b.row[k].bf16[2*n+1])
        ENDFOR
    ENDFOR
    write_row_and_zero(dst, m, tmp, dst.colsb)
ENDFOR

zero_upper_rows(dst, dst.rows)
zero_tileconfig_start()
```

Intrinsics for Intel® Advanced Matrix Extensions AMX-INT8 Instructions

These intrinsics support tile computational operations on 8-bit integers.

_tile_dpbssd

Synopsis

```
void _tile_dpbssd (__tile dst, __tile a, __tile b)
```

Type	Tile
Header file	`#include <immintrin.h>`

Instruction	TDPBSSD tmm, tmm, tmm
CPUID flags	AMXINT8

Description

Compute dot-product of bytes in tiles with a source/destination accumulator. Multiply groups of 4 adjacent pairs of signed 8-bit integers in "a" with corresponding signed 8-bit integers in "b", producing 4 intermediate 32-bit results. Sum these 4 results with the corresponding 32-bit integer in "dst", and store the 32-bit result back to tile "dst".

Technology

AMX

Category

    tmp3 := SignExtend32(x.byte[2]) * SignExtend32(y.byte[2])
    tmp4 := SignExtend32(x.byte[3]) * SignExtend32(y.byte[3])

    RETURN c + tmp1 + tmp2 + tmp3 + tmp4
}

FOR m := 0 TO dst.rows - 1
    tmp := dst.row[m]
    FOR k := 0 TO (a.colsb / 4) - 1
        FOR n := 0 TO (dst.colsb / 4) - 1
            tmp.dword[n] := DPBD(tmp.dword[n], a.row[m].dword[k], b.row[k].dword[n])
        ENDFOR
    ENDFOR
    write_row_and_zero(dst, m, tmp, dst.colsb)
ENDFOR

zero_upper_rows(dst, dst.rows)
zero_tileconfig_start()
```

_tile_dpbsud

Synopsis

```
void _tile_dpbsud (__tile dst, __tile a, __tile b)
```

Type	Tile
Header file	#include <immintrin.h>
Instruction	TDPBSUD tmm, tmm, tmm
CPUID flags	AMXINT8

Description

Compute dot-product of bytes in tiles with a source/destination accumulator. Multiply groups of 4 adjacent pairs of signed 8-bit integers in "a" with corresponding unsigned 8-bit integers in "b", producing 4 intermediate 32-bit results. Sum these 4 results with the corresponding 32-bit integer in "dst", and store the 32-bit result back to tile "dst".

ENDFOR

zero_upper_rows(dst, dst.rows)
zero_tileconfig_start()
```

Intrinsics for Intel(R) Advanced Matrix Extensions AMX-TILE Instructions

These intrinsics support tile architecture.

_tile_loadconfig

Synopsis

```
void _tile_loadconfig (const void * mem_addr)
```

Type	Tile
Header file	`#include <immintrin.h>`
Instruction	`LDTILECFG m512`
CPUID flags	`AMXTILE`

Description

Load tile configuration from a 64-byte memory location specified by "mem_addr". The tile configuration format is specified below, and includes the tile type pallette, the number of bytes per row, and the number of rows. If the specified pallette_id is zero, that signifies the init state for both the tile config and the tile data, and the tiles are zeroed. Any invalid configurations will result in #GP fault.

Technology

AMX

Category

Application-Targeted

Operation

```
//    format of memory payload. each field is a byte.
//         0: palette_id
//         1: startRow (8b)
//     2-15: reserved (must be zero)
//    16-17: tile0.colsb -- bytes_per_row
//    18-19: tile1.colsb
//    20-21: tile2.colsb
//            ...
//    46-47: tile15.colsb
//        48: tile0.rows
//        49: tile1.rows
//        50: tile2.rows
//             ...
//        63: tile15.rows
```

_tile_loadd

Synopsis

```
void _tile_loadd (__tile dst, const void * base, int stride)
```

Type	Tile
Header file	`#include <immintrin.h>`
Instruction	`TILELOADD tmm, sibmem`
CPUID flags	`AMXTILE`

Description

Load tile rows from memory specifieid by "base" address and "stride" into destination tile "dst" using the tile configuration previously configured via "_tile_loadconfig".

Technology

AMX

Category

Application-Targeted

Operation

```
start := tileconfig.startRow
IF start == 0 // not restarting, zero incoming state
    tilezero(dst)
FI

nbytes := dst.colsb
DO WHILE start < dst.rows
    memptr := base + start * stride
    write_row_and_zero(dst, start, read_memory(memptr, nbytes), nbytes)
```

```
    start := start + 1
OD

zero_upper_rows(dst, dst.rows)
zero_tileconfig_start()
```

_tile_release

Synopsis

```
void _tile_release ()
```

Type	Tile
Header file	`#include <immintrin.h>`
Instruction	`TILERELEASE`
CPUID flags	`AMXTILE`

Description

Release the tile configuration to return to the init state, which releases all storage it currently holds.

Technology

AMX

Category

Application-Targeted

_tile_storeconfig

Synopsis

```
void _tile_storeconfig (void * mem_addr)
```

Type	Tile
Header file	`#include <immintrin.h>`
Instruction	`STTILECFG m512`
CPUID flags	`AMXTILE`

Description

Stores the current tile configuration to a 64-byte memory location specified by "mem_addr". The tile configuration format is specified below, and includes the tile type pallette, the number of bytes per row, and the number of rows. If tiles are not configured, all zeroes will be stored to memory.

Technology

AMX

    write_memory(memptr, src.colsb, src.row[start])
    start := start + 1
OD
zero_tileconfig_start()
```

_tile_stream_loadd

Synopsis

```
void _tile_stream_loadd (__tile dst, const void * base, int stride)
```

Type	Tile
Header file	`#include <immintrin.h>`
Instruction	`TILELOADDT1 tmm, sibmem`
CPUID flags	`AMXTILE`

Description

Load tile rows from memory specifieid by "base" address and "stride" into destination tile "dst" using the tile configuration previously configured via "_tile_loadconfig". This intrinsic provides a hint to the implementation that the data will likely not be reused in the near future and the data caching can be optimized accordingly.

Technology

AMX

Category

Application-Targeted

Operation

```
start := tileconfig.startRow
IF start == 0 // not restarting, zero incoming state
    tilezero(dst)
FI

nbytes := dst.colsb

    write_row_and_zero(dst, start, read_memory(memptr, nbytes), nbytes)
    start := start + 1
OD

zero_upper_rows(dst, dst.rows)
zero_tileconfig_start()
```

_tile_zero

Synopsis

```
void _tile_zero (__tile tdest)
```

Type	Tile
Header file	`#include <immintrin.h>`
Instruction	`TILEZERO tmm`
CPUID flags	`AMXTILE`

Description

Zero the tile specified by "tdest".

Technology

AMX

Category

Application-Targeted

Operation

```
nbytes := palette_table[tileconfig.palette_id].bytes_per_row
FOR i := 0 TO palette_table[tileconfig.palette_id].max_rows-1
    FOR j := 0 TO nbytes-1
        tdest.row[i].byte[j] := 0
    ENDFOR
ENDFOR
```

Intrinsics for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) BF16 Instructions

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) BF16 instruction intrinsics are located in the zmmintrin.h header file.

To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

variable	definition
a	a source vector element
b	a second source vector element
k	mask used as a selector; depending on the intrinsic, it may be a writemask or a zeromask

_mm_cvtne2ps_pbh

```
__m128bh _mm_cvtne2ps_pbh (__m128 a, __m128 b)
```

Instructions: vcvtne2ps2bf16 xmm, xmm, xmm

CPUID Flags: AVX512_BF16 + AVX512VL

Converts packed single-precision (32-bit) floating-point elements in two vectors *a* and *b* to packed BF16 (16-bit) floating-point elements, and stores the results in a single vector dst.

_mm_mask_cvtne2ps_pbh

```
__m128bh _mm_mask_cvtne2ps_pbh (__m128bh src, __mmask8 k, __m128 a, __m128 b)
```

Instructions: vcvtne2ps2bf16 xmm {k}, xmm, xmm

CPUID Flags: AVX512_BF16 + AVX512VL

Converts packed single-precision (32-bit) floating-point elements in two vectors *a* and *b* to packed BF16 (16-bit) floating-point elements, and stores the results in a single vector dst using writemask *k*. Elements are copied from src when the corresponding mask bit is not set.

_mm_maskz_cvtne2ps_pbh

```
__m128bh _mm_maskz_cvtne2ps_pbh (__mmask8 k, __m128 a, __m128 b)
```

Instructions: vcvtne2ps2bf16 xmm {k}{z}, xmm, xmm

CPUID Flags: AVX512_BF16 + AVX512VL

Converts packed single-precision (32-bit) floating-point elements in two vectors *a* and *b* to packed BF16 (16-bit) floating-point elements, and stores the results in a single vector dst using zeromask *k*. Elements are zeroed out when the corresponding mask bit is not set.

_mm256_cvtne2ps_pbh

```
__m256bh _mm256_cvtne2ps_pbh (__m256 a, __m256 b)
```

Instructions: vcvtne2ps2bf16 ymm, ymm, ymm

CPUID Flags: AVX512_BF16 + AVX512VL

Converts packed single-precision (32-bit) floating-point elements in two vectors *a* and *b* to packed BF16 (16-bit) floating-point elements, and stores the results in a single vector dst.

_mm256_mask_cvtne2ps_pbh

```
__m256bh _mm256_mask_cvtne2ps_pbh (__m256bh src, __mmask16 k, __m256 a, __m256 b)
```

Instructions: vcvtne2ps2bf16 ymm {k}, ymm, ymm

CPUID Flags: AVX512_BF16 + AVX512VL

Converts packed single-precision (32-bit) floating-point elements in two vectors *a* and *b* to packed BF16 (16-bit) floating-point elements, and stores the results in a single vector dst using writemask *k*. Elements are copied from src when the corresponding mask bit is not set.

_mm256_maskz_cvtne2ps_pbh

```
__m256bh _mm256_maskz_cvtne2ps_pbh (__mmask16 k, __m256 a, __m256 b)
```

Instructions: vcvtne2ps2bf16 ymm {k}{z}, ymm, ymm

CPUID Flags: AVX512_BF16 + AVX512VL

Converts packed single-precision (32-bit) floating-point elements in two vectors *a* and *b* to packed BF16 (16-bit) floating-point elements, and store the results in single vector dst using zeromask *k*. Elements are zeroed out when the corresponding mask bit is not set.

_mm512_cvtne2ps_pbh

```
__m512bh _mm512_cvtne2ps_pbh (__m512 a, __m512 b)
```

Instructions: vcvtne2ps2bf16 zmm, zmm, zmm

CPUID Flags: AVX512_BF16 + AVX512F

Converts packed single-precision (32-bit) floating-point elements in two vectors *a* and *b* to packed BF16 (16-bit) floating-point elements, and stores the results in a single vector dst.

_mm512_mask_cvtne2ps_pbh

```
__m512bh _mm512_mask_cvtne2ps_pbh (__m512bh src, __mmask32 k, __m512 a, __m512 b)
```

Instructions: vcvtne2ps2bf16 zmm {k}, zmm, zmm

CPUID Flags: AVX512_BF16 + AVX512F

Converts packed single-precision (32-bit) floating-point elements in two vectors *a* and *b* to packed BF16 (16-bit) floating-point elements, and stores the results in a single vector dst using writemask *k*. Elements are copied from src when the corresponding mask bit is not set.

_mm512_maskz_cvtne2ps_pbh

```
__m512bh _mm512_maskz_cvtne2ps_pbh (__mmask32 k, __m512 a, __m512 b)
```

Instructions: vcvtne2ps2bf16 zmm {k}{z}, zmm, zmm

CPUID Flags: AVX512_BF16 + AVX512F

Converts packed single-precision (32-bit) floating-point elements in two vectors *a* and *b* to packed BF16 (16-bit) floating-point elements, and stores the results in a single vector dst using zeromask *k*. Elements are zeroed out when the corresponding mask bit is not set.

_mm_cvtneps_pbh

```
__m128bh _mm_cvtneps_pbh (__m128 a)
```

Instructions: vcvtneps2bf16 xmm, xmm

CPUID Flags: AVX512_BF16 + AVX512VL

Converts packed single-precision (32-bit) floating-point elements in *a* to packed BF16 (16-bit) floating-point elements, and stores the results in dst.

_mm_mask_cvtneps_pbh

```
__m128bh _mm_mask_cvtneps_pbh (__m128bh src, __mmask8 k, __m128 a)
```

Instructions: vcvtneps2bf16 xmm {k}, xmm

CPUID Flags: AVX512_BF16 + AVX512VL

Converts packed single-precision (32-bit) floating-point elements in *a* to packed BF16 (16-bit) floating-point elements, and stores the results in dst using writemask *k*. Elements are copied from src when the corresponding mask bit is not set.

_mm_maskz_cvtneps_pbh

```
__m128bh _mm_maskz_cvtneps_pbh (__mmask8 k, __m128 a)
```

Instructions: vcvtneps2bf16 xmm {k}{z}, xmm

CPUID Flags: AVX512_BF16 + AVX512VL

Converts packed single-precision (32-bit) floating-point elements in *a* to packed BF16 (16-bit) floating-point elements, and stores the results in dst using zeromask *k*. Elements are zeroed out when the corresponding mask bit is not set.

_mm256_cvtneps_pbh

```
__m128bh _mm256_cvtneps_pbh (__m256 a)
```

Instructions: vcvtneps2bf16 xmm, ymm

CPUID Flags: AVX512_BF16 + AVX512VL

Converts packed single-precision (32-bit) floating-point elements in *a* to packed BF16 (16-bit) floating-point elements, and stores the results in dst.

_mm256_mask_cvtneps_pbh

```
__m128bh _mm256_mask_cvtneps_pbh (__m128bh src, __mmask8 k, __m256 a)
```

Instructions: vcvtneps2bf16 xmm {k}, ymm

CPUID Flags: AVX512_BF16 + AVX512VL

Converts packed single-precision (32-bit) floating-point elements in *a* to packed BF16 (16-bit) floating-point elements, and stores the results in dst using writemask *k*. Elements are copied from src when the corresponding mask bit is not set.

_mm256_maskz_cvtneps_pbh

```
__m128bh _mm256_maskz_cvtneps_pbh (__mmask8 k, __m256 a)
```

Instructions: vcvtneps2bf16 xmm {k}{z}, ymm

CPUID Flags: AVX512_BF16 + AVX512VL

Converts packed single-precision (32-bit) floating-point elements in *a* to packed BF16 (16-bit) floating-point elements, and stores the results in dst using zeromask *k*. Elements are zeroed out when the corresponding mask bit is not set.

_mm512_cvtneps_pbh

```
__m256bh _mm512_cvtneps_pbh (__m512 a)
```

Instructions: vcvtneps2bf16 ymm, zmm

CPUID Flags: AVX512_BF16 + AVX512F

Converts packed single-precision (32-bit) floating-point elements in *a* to packed BF16 (16-bit) floating-point elements, and stores the results in dst.

_mm512_mask_cvtneps_pbh

```
__m256bh _mm512_mask_cvtneps_pbh (__m256bh src, __mmask16 k, __m512 a)
```

Instructions: vcvtneps2bf16 ymm {k}, zmm

CPUID Flags: AVX512_BF16 + AVX512F

Converts packed single-precision (32-bit) floating-point elements in *a* to packed BF16 (16-bit) floating-point elements, and stores the results in dst using writemask *k*. Elements are copied from src when the corresponding mask bit is not set.

_mm512_maskz_cvtneps_pbh

```
__m256bh _mm512_maskz_cvtneps_pbh (__mmask16 k, __m512 a)
```

Instructions: vcvtneps2bf16 ymm {k}{z}, zmm

CPUID Flags: AVX512_BF16 + AVX512F

Converts packed single-precision (32-bit) floating-point elements in *a* to packed BF16 (16-bit) floating-point elements, and stores the results in dst using zeromask *k*. Elements are zeroed out when the corresponding mask bit is not set.

_mm_dpbf16_ps

```
__m128 _mm_dpbf16_ps (__m128 src, __m128bh a, __m128bh b)
```

Instructions: vdpbf16ps xmm, xmm, xmm

CPUID Flags: AVX512_BF16 + AVX512VL

Computes the dot-product of BF16 (16-bit) floating-point pairs in *a* and *b*, accumulating the intermediate single-precision (32-bit) floating-point elements with elements in src, and stores the results in dst.

_mm_mask_dpbf16_ps

```
__m128 _mm_mask_dpbf16_ps (__m128 src, __mmask8 k, __m128bh a, __m128bh b)
```

Instructions: vdpbf16ps xmm {k}, xmm, xmm

CPUID Flags: AVX512_BF16 + AVX512VL

Computes the dot-product of BF16 (16-bit) floating-point pairs in *a* and *b*, accumulating the intermediate single-precision (32-bit) floating-point elements with elements in src, and stores the results in dst using writemask *k*. Elements are copied from src when the corresponding mask bit is not set.

_mm_maskz_dpbf16_ps

```
__m128 _mm_maskz_dpbf16_ps (__mmask8 k, __m128 src, __m128bh a, __m128bh b)
```

Instructions: vdpbf16ps xmm {k}{z}, xmm, xmm

CPUID Flags: AVX512_BF16 + AVX512VL

Computes the dot-product of BF16 (16-bit) floating-point pairs in *a* and *b*, accumulating the intermediate single-precision (32-bit) floating-point elements with elements in src, and stores the results in dst using zeromask *k*. Elements are zeroed out when the corresponding mask bit is not set).

_mm256_dpbf16_ps

```
__m256 _mm256_dpbf16_ps (__m256 src, __m256bh a, __m256bh b)
```

Instructions: vdpbf16ps ymm, ymm, ymm

CPUID Flags: AVX512_BF16 + AVX512VL

Computes the dot-product of BF16 (16-bit) floating-point pairs in *a* and *b*, accumulating the intermediate single-precision (32-bit) floating-point elements with elements in src, and stores the results in dst.

_mm256_mask_dpbf16_ps

```
__m256 _mm256_mask_dpbf16_ps (__m256 src, __mmask8 k, __m256bh a, __m256bh b)
```

Instructions: vdpbf16ps ymm {k}, ymm, ymm

CPUID Flags: AVX512_BF16 + AVX512VL

Computes the dot-product of BF16 (16-bit) floating-point pairs in *a* and *b*, accumulating the intermediate single-precision (32-bit) floating-point elements with elements in src, and stores the results in dst using writemask *k*. Elements are copied from src when the corresponding mask bit is not set.

_mm256_maskz_dpbf16_ps

```
__m256 _mm256_maskz_dpbf16_ps (__mmask8 k, __m256 src, __m256bh a, __m256bh b)
```

Instructions: vdpbf16ps ymm {k}{z}, ymm, ymm

CPUID Flags: AVX512_BF16 + AVX512VL

Computes the dot-product of BF16 (16-bit) floating-point pairs in *a* and *b*, accumulating the intermediate single-precision (32-bit) floating-point elements with elements in src, and stores the results in dst using zeromask *k*. Elements are zeroed out when the corresponding mask bit is not set).

_mm512_dpbf16_ps

```
__m512 _mm512_dpbf16_ps (__m512 src, __m512bh a, __m512bh b)
```

Instructions: vdpbf16ps zmm, zmm, zmm

CPUID Flags: AVX512_BF16 + AVX512F

Computes the dot-product of BF16 (16-bit) floating-point pairs in *a* and *b*, accumulating the intermediate single-precision (32-bit) floating-point elements with elements in src, and stores the results in dst.

_mm512_mask_dpbf16_ps

```
__m512 _mm512_mask_dpbf16_ps (__m512 src, __mmask16 k, __m512bh a, __m512bh b)
```

Instructions: vdpbf16ps zmm {k}, zmm, zmm

CPUID Flags: AVX512_BF16 + AVX512F

Computes the dot-product of BF16 (16-bit) floating-point pairs in *a* and *b*, accumulating the intermediate single-precision (32-bit) floating-point elements with elements in src, and stores the results in dst using writemask *k*. Elements are copied from src when the corresponding mask bit is not set.

_mm512_maskz_dpbf16_ps

```
__m512 _mm512_maskz_dpbf16_ps (__mmask16 k, __m512 src, __m512bh a, __m512bh b)
```

Instructions: vdpbf16ps zmm {k}{z}, zmm, zmm

CPUID Flags: AVX512_BF16 + AVX512F

Computes the dot-product of BF16 (16-bit) floating-point pairs in *a* and *b*, accumulating the intermediate single-precision (32-bit) floating-point elements with elements in src, and stores the results in dst using zeromask *k*. Elements are zeroed out when the corresponding mask bit is not set.

Intrinsics for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) 4VNNIW Instructions

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) 4VNNIW instruction intrinsics are located in the zmmintrin.h header file.

To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

_mm512_4dpwssd_epi32

```
__mm512i _mm512_4dpwssd_epi32 (__m512 c, __m512 a0, __m512 a1, __m512 a2, __m512 a3, __m128 * b)
```

variable	definition
a*n*	first source block 4 vectors
b	pointer to the second source block
c	third source; accumulator

Instructions: vp4dpwssd zmm1, zmm2+3, m128

Computes 4 vector source-block dot-products of two signed word operands with doubleword accumulation in *c*. The memory operand is sequentially selected in each of the four steps.

_mm512_mask_4dpwssd_epi32

```
__mm512i _mm512_mask_4dpwssd_epi32 (__m512 c, __mmask16 k, __m512 a0, __m512 a1, __m512 a2,
__m512 a3, __m128 * b)
```

variable	definition
a*n*	first source block 4 vectors
b	pointer to the second source block
c	third source; accumulator
k	mask used as a selector

Instructions: vp4dpwssd zmm1 {k}, zmm2+3, m128

Computes 4 vector source-block dot-products of two signed word operands with doubleword accumulation using mask *k*, with accumulation in *c*. The memory operand is sequentially selected in each of the four steps. Elements are copied from *c* when the corresponding mask bit is not set.

_mm512_maskz_4dpwssd_epi32

```
__mm512i _mm512_maskz_4dpwssd_epi32 (__m512 c, __mmask16 k, __m512 a0, __m512 a1, __m512 a2,
__m512 a3, __m128 * b)
```

variable	definition
a*n*	first source block 4 vectors
b	pointer to the second source block
c	third source; accumulator
k	mask used as a selector

Instructions: vp4dpwssd zmm1 {k}, zmm2+3, m128

Computes 4 vector source-block dot-products of two signed word operands with doubleword accumulation using mask *k*, with accumulation in *c*. The memory operand is sequentially selected in each of the four steps. Elements are zeroed out when the corresponding mask bit is not set.

_mm512_4dpwssds_epi32

```
__mm512i _mm512_4dpwssds_epi32 (__m512 c, __m512 a0, __m512 a1, __m512 a2, __m512 a3, __m128 * b)
```

variable	definition
a*n*	first source block 4 vectors
b	pointer to the second source block
c	third source; accumulator

Instructions: vp4dpwssds zmm1, zmm2+3, m128

Computes 4 vector source-block dot-products of two signed word operands with doubleword accumulation and signed saturation in *c*. The memory operand is sequentially selected in each of the four steps.

_mm512_mask_4dpwssds_epi32

```
__mm512i _mm512_mask_4dpwssds_epi32 (__m512 c, __mmask16 k, __m512 a0, __m512 a1, __m512 a2,
__m512 a3, __m128 * b)
```

variable	definition
a*n*	first source block 4 vectors

variable	definition
b	pointer to the second source block
c	third source; accumulator
k	mask used as a selector

Instructions: vp4dpwssds zmm1 {k}, zmm2+3, m128

Computes 4 vector source-block dot-products of two signed word operands with doubleword accumulation and signed saturation using mask *k*, with accumulation in *c*. The memory operand is sequentially selected in each of the four steps. Elements are copied from *c* when the corresponding mask bit is not set.

_mm512_maskz_4dpwssds_epi32

```
__mm512i _mm512_maskz_4dpwssds_epi32 (__m512 c, __mmask16 k, __m512 a0, __m512 a1, __m512 a2,
__m512 a3, __m128 * b)
```

variable	definition
a*n*	first source block 4 vectors
b	pointer to the second source block
c	third source; accumulator
k	mask used as a selector

Instructions: vp4dpwssds zmm1 {k}, zmm2+3, m128

Computes 4 vector source-block dot-products of two signed word operands with doubleword accumulation and signed saturation using mask *k*, with accumulation in *c*. The memory operand is sequentially selected in each of the four steps. Elements are zeroed out when the corresponding mask bit is not set.

Intrinsics for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) 4FMAPS Instructions

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) 4FMAPS instruction intrinsics are located in the zmmintrin.h header file.

To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

_mm512_4fmadd_ps

```
__mm512i _mm512_4fmadd_ps (__m512 c, __m512 a0, __m512 a1, __m512 a2, __m512 a3, __m128 * b)
```

variable	definition
a*n*	first source block 4 vectors
b	pointer to the second source block
c	third source; accumulator

Instructions: v4fmaddps zmm1, zmm2+3, m128

Multiplies packed single-precision floating-point values from source register block {*a*0, *a*1, *a*2, *a*3} by floating-point values pointed to by *b* and accumulates the result in *c*.

_mm512_mask_4fmadd_ps

```
__mm512i _mm512_mask_4fmadd_ps (__m512 c, __mmask16 k, __m512 a0, __m512 a1, __m512 a2, __m512
a3, __m128 * b)
```

variable	definition
a*n*	first source block 4 vectors
b	pointer to the second source block
c	third source; accumulator
k	mask used as a selector

Instructions: v4fmaddps zmm1 {k}, zmm2+3, m128

Multiplies packed single-precision floating-point values from source register block {*a*0, *a*1, *a*2, *a*3} using mask *k* by floating-point values pointed to by *b* and accumulates the result in *c*. Elements are copied from *c* when the corresponding mask bit is not set.

_mm512_maskz_4fmadd_ps

```
__mm512i _mm512 _maskz_4fmadd_ps (__m512 c, __mmask16 k, __m512 a0, __m512 a1, __m512 a2, __m512
a3, __m128 * b)
```

variable	definition
a*n*	first source block 4 vectors
b	pointer to the second source block
c	third source; accumulator
k	mask used as a selector

Instructions: v4fmaddps zmm {k}, zmm+3, m128

Multiplies packed single-precision floating-point values from source register block {*a*0, *a*1, *a*2, *a*3} using mask *k* by floating-point values pointed to by *b* and accumulates the result in *c*. Elements are zeroed out when the corresponding mask bit is not set.

_mm512_4fnmadd_ps

```
__mm512i _mm512_4fnmadd_ps (__m512 c, __m512 a0, __m512 a1, __m512 a2, __m512 a3, __m128 * b)
```

variable	definition
a*n*	first source block 4 vectors
b	pointer to the second source block
c	third source; accumulator

Instructions: v4fnmaddps zmm1, zmm2+3, m128

Multiplies and negates packed single-precision floating-point values from source register block {*a*0, *a*1, *a*2, *a*3} by floating-point values pointed to by *b* and accumulates the result in *c*.

_mm512_mask_4fnmadd_ps

```
__mm512i _mm512_mask_4fnmadd_ps (__m512 c, __mmask16 k, __m512 a0, __m512 a1, __m512 a2, __m512
a3, __m128 * b)
```

variable	definition
a*n*	first source block 4 vectors

variable	definition
b	pointer to the second source block
c	third source; accumulator
k	mask used as a selector

Instructions: v4fnmaddps zmm1 {k}, zmm2+3, m128

Multiplies and negates packed single-precision floating-point values from source register block {*a*0, *a*1, *a*2, *a*3} using mask *k* by floating-point values pointed to by *b* and accumulates the result in *c*. Elements are copied from *c* when the corresponding mask bit is not set.

_mm512_maskz_4fnmadd_ps

```
__mm512i _mm512_maskz_4fnmadd_ps (__m512 c, __mmask16 k, __m512 a0, __m512 a1, __m512 a2, __m512
a3, __m128 * b)
```

variable	definition
a*n*	first source block 4 vectors
b	pointer to the second source block
c	third source; accumulator
k	mask used as a selector

Instructions: v4fnmaddps zmm1 {k}, zmm2+3, m128

Multiplies and negates packed single-precision floating-point values from source register block {*a*0, *a*1, *a*2, *a*3} using mask *k* by floating-point values pointed to by *b* and accumulates the result in *c*. Elements are zeroed out when the corresponding mask bit is not set.

_mm_4fmadd_ss

```
__mm512i _mm_4fmadd_ss (__m128 c, __m128 a0, __m128 a1, __m128 a2, __m128 a3, __m128 * b)
```

variable	definition
a*n*	first source block 4 vectors
b	pointer to the second source block
c	third source; accumulator

Instructions: v4fmaddss xmm1, xmm2+3, m128

Multiplies the lower packed scalar single-precision floating-point values from source register block {*a*0, *a*1, *a*2, *a*3} by floating-point values pointed to by *b* and accumulates the lower element result in *c*.

_mm_mask_4fmadd_ss

```
__mm512i _mm_mask_4fmadd_ss (__m128 c, __mmask8 k, __m128 a0, __m128 a1, __m128 a2, __m128 a3,
__m128 * b)
```

variable	definition
a*n*	first source block 4 vectors
b	pointer to the second source block
c	third source; accumulator
k	mask used as a selector

Instructions: v4fmaddss xmm1 {k}, xmm2+3, m128

Multiplies the lower packed scalar single-precision floating-point values from source register block {*a*0, *a*1, *a*2, *a*3} using mask *k* by floating-point values pointed to by *b* and accumulates the lower element result in *c*. Elements are copied from *c* when the corresponding mask bit is not set.

_mm_maskz_4fmadd_ss

```
__mm512i _mm_maskz_4fmadd_ss (__m128 c, __mmask8 k, __m128 a0, __m128 a1, __m128 a2, __m128 a3,
__m128 * b)
```

variable	definition
a*n*	first source block 4 vectors
b	pointer to the second source block
c	third source; accumulator
k	mask used as a selector

Instructions: v4fmaddss xmm1 {k}, xmm2+3, m128

Multiplies the lower packed scalar single-precision floating-point values from source register block {*a*0, *a*1, *a*2, *a*3} using mask *k* by floating-point values pointed to by *b* and accumulates the lower element result in *c*. Elements are zeroed out when the corresponding mask bit is not set.

_mm_4fnmadd_ss

```
__mm512i _mm_4fnmadd_ss (__m128 c, __m128 a0, __m128 a1, __m128 a2, __m128 a3, __m128 * b)
```

variable	definition
a*n*	first source block 4 vectors
b	pointer to the second source block
c	third source; accumulator

Instructions: v4fnmaddss xmm1, xmm2+3, m128

Multiplies and negates the lower packed scalar single-precision floating-point values from source register block {*a*0, *a*1, *a*2, *a*3} by floating-point values pointed to by *b* and accumulates the lower element result in *c*.

_mm_mask_4fnmadd_ss

```
__mm512i _mm_mask_4fnmadd_ss (__m128 c, __mmask8 k, __m128 a0, __m128 a1, __m128 a2, __m128 a3,
__m128 * b)
```

variable	definition
a*n*	first source block 4 vectors
b	pointer to the second source block
c	third source; accumulator
k	mask used as a selector

Instructions: v4fnmaddss xmm1 {k}, xmm2+3, m128

Multiplies and negates the lower packed scalar single-precision floating-point values from source register block {*a*0, *a*1, *a*2, *a*3} using mask *k* by floating-point values pointed to by *b* and accumulates the lower element result in *c*. Elements are copied from *c* when the corresponding mask bit is not set.

_mm_maskz_4fnmadd_ss

```
__mm512i _mm_maskz_4fnmadd_ss (__m128 c, __mmask8 k, __m128 a0, __m128 a1, __m128 a2, __m128 a3,
__m128 * b)
```

variable	definition
an	first source block 4 vectors
b	pointer to the second source block
c	third source; accumulator
k	mask used as a selector

Instructions: v4fnmaddss xmm1 {k}, xmm2+3, m128

Multiplies and negates the lower packed scalar single-precision floating-point values from source register block {*a*0, *a*1, *a*2, *a*3} using mask *k* by floating-point values pointed to by *b* and accumulates the lower element result in *c*. Elements are zeroed out when the corresponding mask bit is not set.

Intrinsics for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) VPOPCNTDQ Instructions

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) VPOPCNTDQ instruction intrinsics are located in the zmmintrin.h header file.

To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

_mm512_popcnt_epi32

```
__mm512i _mm512_popcnt_epi32 (__m512i a)
```

variable	definition
a	a source vector

Instructions: vpopcntd zmm1, zmm2

Counts the number of bits set to one in each dword element of *a* and places it in the corresponding elements of the result.

_mm512_mask_popcnt_epi32

```
__mm512i _mm512_mask_popcnt_epi32 (__m512 b, __mmask16 k, __m512i a)
```

variable	definition
a	a source vector
b	a second source vector
k	mask used as a selector

Instructions: vpopcntd zmm1 {k}, zmm2

Counts the number of bits set to one in each dword element of *a* using mask *k* and places it in the corresponding elements of the result. Elements are copied from *b* when the corresponding mask bit is not set.

_mm512_maskz_popcnt_epi32

```
__mm512i _mm512_maskz_popcnt_epi32 (__mmask16 k, __m512i a)
```

variable	definition
a	a source vector
k	mask used as a selector

Instructions: vpopcntd zmm1 {k}, zmm2

Counts the number of bits set to one in each dword element of *a* using mask *k* and places it in the corresponding elements of the result. Elements are zeroed out when the corresponding mask bit is not set.

_mm512_popcnt_epi64

```
__mm512i _mm512_popcnt_epi64 (__m512i a)
```

variable	definition
a	a source vector

Instructions: vpopcntd zmm1, zmm2

Counts the number of bits set to one in each quad word element of *a* and places it in the corresponding elements of the result.

_mm512_mask_popcnt_epi64

```
__mm512i _mm512_mask_popcnt_epi64 (__m512 b, __mmask16 k, __m512i a)
```

variable	definition
a	a source vector
b	a second source vector
k	mask used as a selector

Instructions: vpopcntd zmm1 {k}, zmm2

Counts the number of bits set to one in each quad word element of *a* using mask *k* and places it in the corresponding elements of the result. Elements are copied from *b* when the corresponding mask bit is not set.

_mm512_maskz_popcnt_epi64

```
__mm512i _mm512_maskz_popcnt_epi64 (__m512 b, __mmask16 k, __m512 a)
```

variable	definition
a	a source vector
b	a second source vector
k	mask used as a selector

Instructions: vpopcntd zmm2 {k}, zmm2

Counts the number of bits set to one in each quad word element of *a* using mask *k* and places it in the corresponding elements of the result. Elements are zeroed out when the corresponding mask bit is not set.

Intrinsics for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) Additional Instructions

Additional Intel® Advanced Vector Extensions 512 (Intel® AVX-512) Instructions

The additional instructions documented in this section enrich the operations available as part of Intel® AVX-512 Foundation instructions. A large portion of these instructions can be divided into two groups: Byte and Word Instructions, and Doubleword and Quadword Instructions. The group of byte and word (8 and 16-bit) operations, indicated by the AVX512BW and AVX512VBMI CPUID flags, enhance small integer operations. The group of doubleword and quadword (32 and 64-bit) operations indicated by the AVX512DQ and AVX512IFMA52 CPUID flags, enhance integer and floating-point operations.

An additional orthogonal capability known as Vector Length Extensions provide for most AVX-512 instructions to operate on 128 or 256 bits, instead of only 512. Vector Length Extensions can currently be applied to most Foundation Instructions, the Conflict Detection Instructions as well as the new byte, word, doubleword and quadword instructions. These AVX-512 Vector Length Extensions are indicated by the AVX512VL CPUID flag. The use of Vector Length Extensions extends most AVX-512 operations to also operate on XMM (128-bit, SSE) registers and YMM (256-bit, AVX) registers. The use of Vector Length Extensions allows the capabilities of EVEX encodings, including the use of mask registers and access to registers 16..31, to be applied to XMM and YMM registers instead of only to ZMM registers.

Byte and Word Instructions

The byte and word instructions, indicated by the AVX512BW CPUID flag, extend write-masking and zero-masking to support smaller element sizes. The original AVX-512 Foundation instructions supported such masking with vector element sizes of 32 or 64 bits. As a 512-bit vector register could hold at most 16 32-bit elements, a write-mask size of 16 bits was sufficient.

With an instruction indicated by an AVX512BW CPUID flag, a 512-bit vector can hold 64 8-bit elements or 32 16-bit elements, so write masks must be able to hold 64 bits. To support this, two new mask types, `__mmask32` and `__mmask64` have been introduced, along with additional maskable intrinsics that operate on vectors of 8 and 16-bit elements. For example,

```
__m512i _mm512_mask_abs_epi8(__m512i src, __mmask64 k, __m512i a);
```

will compute the absolute value of 8-bit elements in *a* corresponding to the set bits of write mask *k*. Elements corresponding to a zero bit in *k* are blended in from *src*.

Doubleword and Quadword Instructions

The doubleword and quadword instructions, indicated by the AVX512DQ CPUID flag, consist of additional instructions along the lines of the Foundation instructions indicated by the AVX512F CPUID flag in that they operate on 512-bit vectors whose elements are 16 32-bit elements or 8 64-bit elements. Some of these instructions provide new functionality such as the conversion of floating point numbers to 64-bit integers. Other instructions promote existing instructions (e.g., vxorps) to use 512-bit registers.

Vector Length Extensions

The vector length extensions indicated by CPUID flag AVX512VL add write-masking, zero-masking, and embedded broadcast features to 128- and 256-bit vector lengths. So for example,

```
__m256 _mm256_maskz_add_ps(__mmask8 k, __m256 a, __m256 b);
```

will add corresponding float32 elements of *a* and *b* where the mask bit from *k* is set, and will produce zero in the elements where the bit from *k* is clear.

Intrinsics for Arithmetic Operations

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `zmmintrin.h` header file.
To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

variable	definition
src	source element to use based on writemask result
k	writemask used as a selector
a	first source vector element
b	second source vector element
c	third source vector element

_mm_mask_add_pd

```
__m128d _mm_mask_add_pd(__m128d src, __mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vaddpd

Add packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_add_pd

```
__m128d _mm_maskz_add_pd(__mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vaddpd

Add packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_add_pd

```
__m256d _mm256_mask_add_pd(__m256d src, __mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vaddpd

Add packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_add_pd

```
__m256d _mm256_maskz_add_pd(__mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vaddpd

Add packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_add_ps

```
__m128 _mm_mask_add_ps(__m128 src, __mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vaddps

Add packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_add_ps

```
__m128 _mm_maskz_add_ps(__mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vaddps

Add packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_add_ps

```
__m256 _mm256_mask_add_ps(__m256 src, __mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vaddps

Add packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_add_ps

```
__m256 _mm256_maskz_add_ps(__mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vaddps

Add packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_div_pd

```
__m128d _mm_mask_div_pd(__m128d src, __mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vdivpd

Divide packed double-precision (64-bit) floating-point elements in *a* by packed elements in *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_div_pd

```
__m128d _mm_maskz_div_pd(__mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vdivpd

Divide packed double-precision (64-bit) floating-point elements in *a* by packed elements in *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_div_pd

```
__m256d _mm256_mask_div_pd(__m256d src, __mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vdivpd

Divide packed double-precision (64-bit) floating-point elements in *a* by packed elements in *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_div_pd

```
__m256d _mm256_maskz_div_pd(__mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vdivpd

Divide packed double-precision (64-bit) floating-point elements in *a* by packed elements in *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_div_ps

```
__m128 _mm_mask_div_ps(__m128 src, __mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vdivps

Divide packed single-precision (32-bit) floating-point elements in *a* by packed elements in *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_div_ps

```
__m128 _mm_maskz_div_ps(__mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vdivps

Divide packed single-precision (32-bit) floating-point elements in *a* by packed elements in *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_div_ps

```
__m256 _mm256_mask_div_ps(__m256 src, __mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vdivps

Divide packed single-precision (32-bit) floating-point elements in *a* by packed elements in *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_div_ps

```
__m256 _mm256_maskz_div_ps(__mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vdivps

Divide packed single-precision (32-bit) floating-point elements in *a* by packed elements in *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_fmadd_pd

```
__m128d _mm_mask_fmadd_pd(__m128d a, __mmask8 k, __m128d b, __m128d c)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfmadd132pd, vfmadd213pd, vfmadd231pd

Multiply packed double-precision (64-bit) floating-point elements in *a* and *b*, add the intermediate result to packed elements in *c*, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm_mask3_fmadd_pd

```
__m128d _mm_mask3_fmadd_pd(__m128d a, __m128d b, __m128d c, __mmask8 k)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfmadd132pd, vfmadd213pd, vfmadd231pd

Multiply packed double-precision (64-bit) floating-point elements in *a* and *b*, add the intermediate result to packed elements in *c*, and return the results using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm_maskz_fmadd_pd

```
__m128d _mm_maskz_fmadd_pd(__mmask8 k, __m128d a, __m128d b, __m128d c)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfmadd132pd, vfmadd213pd, vfmadd231pd

Multiply packed double-precision (64-bit) floating-point elements in *a* and *b*, add the intermediate result to packed elements in *c*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_fmadd_pd

```
__m256d _mm256_mask_fmadd_pd(__m256d a, __mmask8 k, __m256d b, __m256d c)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfmadd132pd, vfmadd213pd, vfmadd231pd

Multiply packed double-precision (64-bit) floating-point elements in *a* and *b*, add the intermediate result to packed elements in *c*, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm256_mask3_fmadd_pd

```
__m256d _mm256_mask3_fmadd_pd(__m256d a, __m256d b, __m256d c, __mmask8 k)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfmadd132pd, vfmadd213pd, vfmadd231pd

Multiply packed double-precision (64-bit) floating-point elements in *a* and *b*, add the intermediate result to packed elements in *c*, and return the results using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm256_maskz_fmadd_pd

```
__m256d _mm256_maskz_fmadd_pd(__mmask8 k, __m256d a, __m256d b, __m256d c)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfmadd132pd, vfmadd213pd, vfmadd231pd

Multiply packed double-precision (64-bit) floating-point elements in *a* and *b*, add the intermediate result to packed elements in *c*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_fmadd_ps

```
__m128 _mm_mask_fmadd_ps(__m128 a, __mmask8 k, __m128 b, __m128 c)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfmadd132ps, vfmadd213ps, vfmadd231ps

Multiply packed single-precision (32-bit) floating-point elements in *a* and *b*, add the intermediate result to packed elements in *c*, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm_mask3_fmadd_ps

```
__m128 _mm_mask3_fmadd_ps(__m128 a, __m128 b, __m128 c, __mmask8 k)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfmadd132ps, vfmadd213ps, vfmadd231ps

Multiply packed single-precision (32-bit) floating-point elements in *a* and *b*, add the intermediate result to packed elements in *c*, and return the results using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm_maskz_fmadd_ps

```
__m128 _mm_maskz_fmadd_ps(__mmask8 k, __m128 a, __m128 b, __m128 c)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfmadd132ps, vfmadd213ps, vfmadd231ps

Multiply packed single-precision (32-bit) floating-point elements in *a* and *b*, add the intermediate result to packed elements in *c*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_fmadd_ps

```
__m256 _mm256_mask_fmadd_ps(__m256 a, __mmask8 k, __m256 b, __m256 c)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfmadd132ps, vfmadd213ps, vfmadd231ps

Multiply packed single-precision (32-bit) floating-point elements in *a* and *b*, add the intermediate result to packed elements in *c*, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm256_mask3_fmadd_ps

```
__m256 _mm256_mask3_fmadd_ps(__m256 a, __m256 b, __m256 c, __mmask8 k)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfmadd132ps, vfmadd213ps, vfmadd231ps

Multiply packed single-precision (32-bit) floating-point elements in *a* and *b*, add the intermediate result to packed elements in *c*, and return the results using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm256_maskz_fmadd_ps

```
__m256 _mm256_maskz_fmadd_ps(__mmask8 k, __m256 a, __m256 b, __m256 c)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfmadd132ps, vfmadd213ps, vfmadd231ps

Multiply packed single-precision (32-bit) floating-point elements in *a* and *b*, add the intermediate result to packed elements in *c*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_fmaddsub_pd

```
__m128d _mm_mask_fmaddsub_pd(__m128d a, __mmask8 k, __m128d b, __m128d c)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfmaddsub132pd, vfmaddsub213pd, vfmaddsub231pd

Multiply packed double-precision (64-bit) floating-point elements in *a* and *b*, alternatively add and subtract packed elements in *c* to/from the intermediate result, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm_mask3_fmaddsub_pd

```
__m128d _mm_mask3_fmaddsub_pd(__m128d a, __m128d b, __m128d c, __mmask8 k)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfmaddsub132pd, vfmaddsub213pd, vfmaddsub231pd

Multiply packed double-precision (64-bit) floating-point elements in *a* and *b*, alternatively add and subtract packed elements in *c* to/from the intermediate result, and return the results using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm_maskz_fmaddsub_pd

```
__m128d _mm_maskz_fmaddsub_pd(__mmask8 k, __m128d a, __m128d b, __m128d c)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfmaddsub132pd, vfmaddsub213pd, vfmaddsub231pd

Multiply packed double-precision (64-bit) floating-point elements in *a* and *b*, alternatively add and subtract packed elements in *c* to/from the intermediate result, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_fmaddsub_pd

```
__m256d _mm256_mask_fmaddsub_pd(__m256d a, __mmask8 k, __m256d b, __m256d c)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfmaddsub132pd, vfmaddsub213pd, vfmaddsub231pd

Multiply packed double-precision (64-bit) floating-point elements in *a* and *b*, alternatively add and subtract packed elements in *c* to/from the intermediate result, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm256_mask3_fmaddsub_pd

```
__m256d _mm256_mask3_fmaddsub_pd(__m256d a, __m256d b, __m256d c, __mmask8 k)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfmaddsub132pd, vfmaddsub213pd, vfmaddsub231pd

Multiply packed double-precision (64-bit) floating-point elements in *a* and *b*, alternatively add and subtract packed elements in *c* to/from the intermediate result, and return the results using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm256_maskz_fmaddsub_pd

```
__m256d _mm256_maskz_fmaddsub_pd(__mmask8 k, __m256d a, __m256d b, __m256d c)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfmaddsub132pd, vfmaddsub213pd, vfmaddsub231pd

Multiply packed double-precision (64-bit) floating-point elements in *a* and *b*, alternatively add and subtract packed elements in *c* to/from the intermediate result, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfnmsub132pd, vfnmsub213pd, vfnmsub231pd

Multiply packed double-precision (64-bit) floating-point elements in *a* and *b*, subtract packed elements in *c* from the negated intermediate result, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm_mask3_fnmsub_pd

```
__m128d _mm_mask3_fnmsub_pd(__m128d a, __m128d b, __m128d c, __mmask8 k)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfnmsub132pd, vfnmsub213pd, vfnmsub231pd

Multiply packed double-precision (64-bit) floating-point elements in *a* and *b*, subtract packed elements in *c* from the negated intermediate result, and return the results using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm_maskz_fnmsub_pd

```
__m128d _mm_maskz_fnmsub_pd(__mmask8 k, __m128d a, __m128d b, __m128d c)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfnmsub132pd, vfnmsub213pd, vfnmsub231pd

Multiply packed double-precision (64-bit) floating-point elements in *a* and *b*, subtract packed elements in *c* from the negated intermediate result, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_fnmsub_pd

```
__m256d _mm256_mask_fnmsub_pd(__m256d a, __mmask8 k, __m256d b, __m256d c)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfnmsub132pd, vfnmsub213pd, vfnmsub231pd

Multiply packed double-precision (64-bit) floating-point elements in *a* and *b*, subtract packed elements in *c* from the negated intermediate result, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm256_mask3_fnmsub_pd

```
__m256d _mm256_mask3_fnmsub_pd(__m256d a, __m256d b, __m256d c, __mmask8 k)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfnmsub132pd, vfnmsub213pd, vfnmsub231pd

Multiply packed double-precision (64-bit) floating-point elements in *a* and *b*, subtract packed elements in *c* from the negated intermediate result, and return the results using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm256_maskz_fnmsub_pd

```
__m256d _mm256_maskz_fnmsub_pd(__mmask8 k, __m256d a, __m256d b, __m256d c)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfnmsub132pd, vfnmsub213pd, vfnmsub231pd

Multiply packed double-precision (64-bit) floating-point elements in *a* and *b*, subtract packed elements in *c* from the negated intermediate result, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_fnmsub_ps

```
__m128 _mm_mask_fnmsub_ps(__m128 a, __mmask8 k, __m128 b, __m128 c)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfnmsub132ps, vfnmsub213ps, vfnmsub231ps

Multiply packed single-precision (32-bit) floating-point elements in *a* and *b*, subtract packed elements in *c* from the negated intermediate result, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm_mask3_fnmsub_ps

```
__m128 _mm_mask3_fnmsub_ps(__m128 a, __m128 b, __m128 c, __mmask8 k)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfnmsub132ps, vfnmsub213ps, vfnmsub231ps

Multiply packed single-precision (32-bit) floating-point elements in *a* and *b*, subtract packed elements in *c* from the negated intermediate result, and return the results using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm_maskz_fnmsub_ps

```
__m128 _mm_maskz_fnmsub_ps(__mmask8 k, __m128 a, __m128 b, __m128 c)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfnmsub132ps, vfnmsub213ps, vfnmsub231ps

Multiply packed single-precision (32-bit) floating-point elements in *a* and *b*, subtract packed elements in *c* from the negated intermediate result, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_fnmsub_ps

```
__m256 _mm256_mask_fnmsub_ps(__m256 a, __mmask8 k, __m256 b, __m256 c)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfnmsub132ps, vfnmsub213ps, vfnmsub231ps

Multiply packed single-precision (32-bit) floating-point elements in *a* and *b*, subtract packed elements in *c* from the negated intermediate result, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm256_mask3_fnmsub_ps

```
__m256 _mm256_mask3_fnmsub_ps(__m256 a, __m256 b, __m256 c, __mmask8 k)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfnmsub132ps, vfnmsub213ps, vfnmsub231ps

Multiply packed single-precision (32-bit) floating-point elements in *a* and *b*, subtract packed elements in *c* from the negated intermediate result, and return the results using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm256_maskz_fnmsub_ps

```
__m256 _mm256_maskz_fnmsub_ps(__mmask8 k, __m256 a, __m256 b, __m256 c)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfnmsub132ps, vfnmsub213ps, vfnmsub231ps

Multiply packed single-precision (32-bit) floating-point elements in *a* and *b*, subtract packed elements in *c* from the negated intermediate result, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_max_pd

```
__m128d _mm_mask_max_pd(__m128d src, __mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmaxpd

Compare packed double-precision (64-bit) floating-point elements in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_max_pd

```
__m128d _mm_maskz_max_pd(__mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmaxpd

Compare packed double-precision (64-bit) floating-point elements in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_max_pd

```
__m256d _mm256_mask_max_pd(__m256d src, __mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmaxpd

Compare packed double-precision (64-bit) floating-point elements in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_max_pd

```
__m256d _mm256_maskz_max_pd(__mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmaxpd

Compare packed double-precision (64-bit) floating-point elements in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_max_ps

```
__m128 _mm_mask_max_ps(__m128 src, __mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmaxps

Compare packed single-precision (32-bit) floating-point elements in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_max_ps

```
__m128 _mm_maskz_max_ps(__mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmaxps

Compare packed single-precision (32-bit) floating-point elements in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_max_ps

```
__m256 _mm256_mask_max_ps(__m256 src, __mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmaxps

Compare packed single-precision (32-bit) floating-point elements in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_max_ps

```
__m256 _mm256_maskz_max_ps(__mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmaxps

Compare packed single-precision (32-bit) floating-point elements in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_min_pd

```
__m128d _mm_mask_min_pd(__m128d src, __mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vminpd

Compare packed double-precision (64-bit) floating-point elements in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_min_pd

```
__m128d _mm_maskz_min_pd(__mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vminpd

Compare packed double-precision (64-bit) floating-point elements in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_min_pd

```
__m256d _mm256_mask_min_pd(__m256d src, __mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vminpd

Compare packed double-precision (64-bit) floating-point elements in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_min_pd

```
__m256d _mm256_maskz_min_pd(__mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vminpd

Compare packed double-precision (64-bit) floating-point elements in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_min_ps

```
__m128 _mm_mask_min_ps(__m128 src, __mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vminps

Compare packed single-precision (32-bit) floating-point elements in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_min_ps

```
__m128 _mm_maskz_min_ps(__mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vminps

Compare packed single-precision (32-bit) floating-point elements in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_min_ps

```
__m256 _mm256_mask_min_ps(__m256 src, __mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vminps

Compare packed single-precision (32-bit) floating-point elements in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_min_ps

```
__m256 _mm256_maskz_min_ps(__mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vminps

Compare packed single-precision (32-bit) floating-point elements in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_mul_pd

```
__m128d _mm_mask_mul_pd(__m128d src, __mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmulpd

Multiply packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). RM.

_mm_maskz_mul_pd

```
__m128d _mm_maskz_mul_pd(__mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmulpd

Multiply packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_mul_pd

```
__m256d _mm256_mask_mul_pd(__m256d src, __mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmulpd

Multiply packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_mul_pd

```
__m256d _mm256_maskz_mul_pd(__mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmulpd

Multiply packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_mul_ps

```
__m128 _mm_mask_mul_ps(__m128 src, __mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmulps

Multiply packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). RM.

_mm_maskz_mul_ps

```
__m128 _mm_maskz_mul_ps(__mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmulps

Multiply packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_mul_ps

```
__m256 _mm256_mask_mul_ps(__m256 src, __mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmulps

Multiply packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). RM.

_mm256_maskz_mul_ps

```
__m256 _mm256_maskz_mul_ps(__mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmulps

Multiply packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_rcp14_pd

```
__m128d _mm_mask_rcp14_pd(__m128d src, __mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrcp14pd

Compute the approximate reciprocal of packed double-precision (64-bit) floating-point elements in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). The maximum relative error for this approximation is less than 2^-14.

_mm_maskz_rcp14_pd

```
__m128d _mm_maskz_rcp14_pd(__mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrcp14pd

Compute the approximate reciprocal of packed double-precision (64-bit) floating-point elements in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). The maximum relative error for this approximation is less than 2^-14.

_mm_rcp14_pd

```
__m128d _mm_rcp14_pd(__m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrcp14pd

Compute the approximate reciprocal of packed double-precision (64-bit) floating-point elements in *a*, and return the results. The maximum relative error for this approximation is less than 2^-14.

_mm256_mask_rcp14_pd

```
__m256d _mm256_mask_rcp14_pd(__m256d src, __mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrcp14pd

Compute the approximate reciprocal of packed double-precision (64-bit) floating-point elements in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). The maximum relative error for this approximation is less than 2^-14.

_mm256_maskz_rcp14_pd

```
__m256d _mm256_maskz_rcp14_pd(__mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrcp14pd

Compute the approximate reciprocal of packed double-precision (64-bit) floating-point elements in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). The maximum relative error for this approximation is less than 2^-14.

_mm256_rcp14_pd

```
__m256d _mm256_rcp14_pd(__m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrcp14pd

Compute the approximate reciprocal of packed double-precision (64-bit) floating-point elements in *a*, and return the results. The maximum relative error for this approximation is less than 2^-14.

_mm_mask_rcp14_ps

```
__m128 _mm_mask_rcp14_ps(__m128 src, __mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrcp14ps

Compute the approximate reciprocal of packed single-precision (32-bit) floating-point elements in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). The maximum relative error for this approximation is less than 2^-14.

_mm_maskz_rcp14_ps

```
__m128 _mm_maskz_rcp14_ps(__mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrcp14ps

Compute the approximate reciprocal of packed single-precision (32-bit) floating-point elements in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). The maximum relative error for this approximation is less than 2^-14.

_mm_rcp14_ps

```
__m128 _mm_rcp14_ps(__m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrcp14ps

Compute the approximate reciprocal of packed single-precision (32-bit) floating-point elements in *a*, and return the results. The maximum relative error for this approximation is less than 2^-14.

_mm256_mask_rcp14_ps

```
__m256 _mm256_mask_rcp14_ps(__m256 src, __mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrcp14ps

Compute the approximate reciprocal of packed single-precision (32-bit) floating-point elements in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). The maximum relative error for this approximation is less than 2^-14.

_mm256_maskz_rcp14_ps

```
__m256 _mm256_maskz_rcp14_ps(__mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrcp14ps

Compute the approximate reciprocal of packed single-precision (32-bit) floating-point elements in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). The maximum relative error for this approximation is less than 2^-14.

_mm256_rcp14_ps

```
__m256 _mm256_rcp14_ps(__m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrcp14ps

Compute the approximate reciprocal of packed single-precision (32-bit) floating-point elements in *a*, and return the results. The maximum relative error for this approximation is less than 2^-14.

_mm_mask_rsqrt14_pd

```
__m128d _mm_mask_rsqrt14_pd(__m128d src, __mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrsqrt14pd

Compute the approximate reciprocal square root of packed double-precision (64-bit) floating-point elements in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). The maximum relative error for this approximation is less than 2^-14.

_mm_maskz_rsqrt14_pd

```
__m128d _mm_maskz_rsqrt14_pd(__mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrsqrt14pd

Compute the approximate reciprocal square root of packed double-precision (64-bit) floating-point elements in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). The maximum relative error for this approximation is less than 2^-14.

__m128 _mm_maskz_rsqrt14_ps(__mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrsqrt14ps

Compute the approximate reciprocal square root of packed single-precision (32-bit) floating-point elements in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). The maximum relative error for this approximation is less than 2^-14.

_mm256_mask_rsqrt14_ps

```
__m256 _mm256_mask_rsqrt14_ps(__m256 src, __mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrsqrt14ps

Compute the approximate reciprocal square root of packed single-precision (32-bit) floating-point elements in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). The maximum relative error for this approximation is less than 2^-14.

_mm256_maskz_rsqrt14_ps

```
__m256 _mm256_maskz_rsqrt14_ps(__mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrsqrt14ps

Compute the approximate reciprocal square root of packed single-precision (32-bit) floating-point elements in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). The maximum relative error for this approximation is less than 2^-14.

_mm_mask_sqrt_pd

```
__m128d _mm_mask_sqrt_pd(__m128d src, __mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vsqrtpd

Compute the square root of packed double-precision (64-bit) floating-point elements in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_sqrt_pd

```
__m128d _mm_maskz_sqrt_pd(__mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vsqrtpd

Compute the square root of packed double-precision (64-bit) floating-point elements in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_sqrt_pd

```
__m256d _mm256_mask_sqrt_pd(__m256d src, __mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vsqrtpd

Compute the square root of packed double-precision (64-bit) floating-point elements in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_sqrt_pd

```
__m256d _mm256_maskz_sqrt_pd(__mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vsqrtpd

Compute the square root of packed double-precision (64-bit) floating-point elements in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_sqrt_ps

```
__m128 _mm_mask_sqrt_ps(__m128 src, __mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vsqrtps

Compute the square root of packed single-precision (32-bit) floating-point elements in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_sqrt_ps

```
__m128 _mm_maskz_sqrt_ps(__mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vsqrtps

Compute the square root of packed single-precision (32-bit) floating-point elements in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_sqrt_ps

```
__m256 _mm256_mask_sqrt_ps(__m256 src, __mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vsqrtps

Compute the square root of packed single-precision (32-bit) floating-point elements in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_sqrt_ps

```
__m256 _mm256_maskz_sqrt_ps(__mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vsqrtps

Compute the square root of packed single-precision (32-bit) floating-point elements in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_sub_pd

```
__m128d _mm_mask_sub_pd(__m128d src, __mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vsubpd

Subtract packed double-precision (64-bit) floating-point elements in *b* from packed double-precision (64-bit) floating-point elements in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_sub_pd

```
__m128d _mm_maskz_sub_pd(__mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vsubpd

Subtract packed double-precision (64-bit) floating-point elements in *b* from packed double-precision (64-bit) floating-point elements in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_sub_pd

```
__m256d _mm256_mask_sub_pd(__m256d src, __mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vsubpd

Subtract packed double-precision (64-bit) floating-point elements in *b* from packed double-precision (64-bit) floating-point elements in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_sub_pd

```
__m256d _mm256_maskz_sub_pd(__mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vsubpd

Subtract packed double-precision (64-bit) floating-point elements in *b* from packed double-precision (64-bit) floating-point elements in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_sub_ps

```
__m128 _mm_mask_sub_ps(__m128 src, __mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vsubps

Subtract packed single-precision (32-bit) floating-point elements in *b* from packed single-precision (32-bit) floating-point elements in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_sub_ps

```
__m128 _mm_maskz_sub_ps(__mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vsubps

Subtract packed single-precision (32-bit) floating-point elements in *b* from packed single-precision (32-bit) floating-point elements in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_sub_ps

```
__m256 _mm256_mask_sub_ps(__m256 src, __mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vsubps

Subtract packed single-precision (32-bit) floating-point elements in *b* from packed single-precision (32-bit) floating-point elements in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_sub_ps

```
__m256 _mm256_maskz_sub_ps(__mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vsubps

Subtract packed single-precision (32-bit) floating-point elements in *b* from packed single-precision (32-bit) floating-point elements in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_abs_epi8

```
__m128i _mm_mask_abs_epi8(__m128i src, __mmask16 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpabsb

Compute the absolute value of packed 8-bit integers in *a*, and store the unsigned results in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_abs_epi8

```
__m128i _mm_maskz_abs_epi8(__mmask16 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpabsb

Compute the absolute value of packed 8-bit integers in *a*, and store the unsigned results in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_abs_epi8

```
__m256i _mm256_mask_abs_epi8(__m256i src, __mmask32 k, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpabsb

Compute the absolute value of packed 8-bit integers in *a*, and store the unsigned results in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_abs_epi8

```
__m256i _mm256_maskz_abs_epi8(__mmask32 k, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpabsb

Compute the absolute value of packed 8-bit integers in *a*, and store the unsigned results in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_abs_epi8

```
__m512i _mm512_abs_epi8(__m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpabsb

Compute the absolute value of packed 8-bit integers in *a*, and store the unsigned results in the return value.

_mm512_mask_abs_epi8

```
__m512i _mm512_mask_abs_epi8(__m512i src, __mmask64 k, __m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpabsb

Compute the absolute value of packed 8-bit integers in *a*, and store the unsigned results in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_abs_epi8

```
__m512i _mm512_maskz_abs_epi8(__mmask64 k, __m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpabsb

Compute the absolute value of packed 8-bit integers in *a*, and store the unsigned results in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_abs_epi32

```
__m128i _mm_mask_abs_epi32(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpabsd

Compute the absolute value of packed 32-bit integers in *a*, and store the unsigned results in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_abs_epi32

```
__m128i _mm_maskz_abs_epi32(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpabsd

Compute the absolute value of packed 32-bit integers in *a*, and store the unsigned results in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_abs_epi32

```
__m256i _mm256_mask_abs_epi32(__m256i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpabsd

Compute the absolute value of packed 32-bit integers in *a*, and store the unsigned results in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_abs_epi32

```
__m256i _mm256_maskz_abs_epi32(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpabsd

Compute the absolute value of packed 32-bit integers in *a*, and store the unsigned results in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_abs_epi64

```
__m128i _mm_abs_epi64(__m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpabsq

Compute the absolute value of packed 64-bit integers in *a*, and store the unsigned results in the return value.

_mm_mask_abs_epi64

```
__m128i _mm_mask_abs_epi64(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpabsq

Compute the absolute value of packed 64-bit integers in *a*, and store the unsigned results in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_abs_epi64

```
__m128i _mm_maskz_abs_epi64(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpabsq

Compute the absolute value of packed 64-bit integers in *a*, and store the unsigned results in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_abs_epi64

```
__m256i _mm256_abs_epi64(__m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpabsq

Compute the absolute value of packed 64-bit integers in *a*, and store the unsigned results in the return value.

_mm256_mask_abs_epi64

```
__m256i _mm256_mask_abs_epi64(__m256i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpabsq

Compute the absolute value of packed 64-bit integers in *a*, and store the unsigned results in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_abs_epi64

```
__m256i _mm256_maskz_abs_epi64(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpabsq

Compute the absolute value of packed 64-bit integers in *a*, and store the unsigned results in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_abs_epi16

```
__m128i _mm_mask_abs_epi16(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpabsw

Compute the absolute value of packed 16-bit integers in *a*, and store the unsigned results in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_abs_epi16

```
__m128i _mm_maskz_abs_epi16(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpabsw

Compute the absolute value of packed 16-bit integers in *a*, and store the unsigned results in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_abs_epi16

```
__m256i _mm256_mask_abs_epi16(__m256i src, __mmask16 k, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpabsw

Compute the absolute value of packed 16-bit integers in *a*, and store the unsigned results in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_abs_epi16

```
__m256i _mm256_maskz_abs_epi16(__mmask16 k, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpabsw

Compute the absolute value of packed 16-bit integers in *a*, and store the unsigned results in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_abs_epi16

```
__m512i _mm512_abs_epi16(__m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpabsw

Compute the absolute value of packed 16-bit integers in *a*, and store the unsigned results in the return value.

_mm512_mask_abs_epi16

```
__m512i _mm512_mask_abs_epi16(__m512i src, __mmask32 k, __m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpabsw

Compute the absolute value of packed 16-bit integers in *a*, and store the unsigned results in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_abs_epi16

```
__m512i _mm512_maskz_abs_epi16(__mmask32 k, __m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpabsw

Compute the absolute value of packed 16-bit integers in *a*, and store the unsigned results in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_add_epi8

```
__m128i _mm_mask_add_epi8(__m128i src, __mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddb

Add packed 8-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_add_epi8

```
__m128i _mm_maskz_add_epi8(__mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddb

Add packed 8-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_add_epi8

```
__m256i _mm256_mask_add_epi8(__m256i src, __mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddb

Add packed 8-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_add_epi8

```
__m256i _mm256_maskz_add_epi8(__mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddb

Add packed 8-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_add_epi8

```
__m512i _mm512_add_epi8(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpaddb

Add packed 8-bit integers in *a* and *b*, and return the results.

_mm512_mask_add_epi8

```
__m512i _mm512_mask_add_epi8(__m512i src, __mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpaddb

Add packed 8-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_add_epi8

```
__m512i _mm512_maskz_add_epi8(__mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpaddb

Add packed 8-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_add_epi32

```
__m128i _mm_mask_add_epi32(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpaddd

Add packed 32-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_add_epi32

```
__m128i _mm_maskz_add_epi32(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpaddd

Add packed 32-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_add_epi32

```
__m256i _mm256_mask_add_epi32(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpaddd

Add packed 32-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_add_epi32

```
__m256i _mm256_maskz_add_epi32(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpaddd

Add packed 32-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_add_epi64

```
__m128i _mm_mask_add_epi64(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpaddq

Add packed 64-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_add_epi64

```
__m128i _mm_maskz_add_epi64(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpaddq

Add packed 64-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_add_epi64

```
__m256i _mm256_mask_add_epi64(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpaddq

Add packed 64-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_add_epi64

```
__m256i _mm256_maskz_add_epi64(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpaddq

Add packed 64-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_adds_epi8

```
__m128i _mm_mask_adds_epi8(__m128i src, __mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddsb

Add packed 8-bit integers in *a* and *b* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_adds_epi8

```
__m128i _mm_maskz_adds_epi8(__mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddsb

Add packed 8-bit integers in *a* and *b* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_adds_epi8

```
__m256i _mm256_mask_adds_epi8(__m256i src, __mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddsb

Add packed 8-bit integers in *a* and *b* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_adds_epi8

```
__m256i _mm256_maskz_adds_epi8(__mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddsb

Add packed 8-bit integers in *a* and *b* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_adds_epi8

```
__m512i _mm512_adds_epi8(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpaddsb

Add packed 8-bit integers in *a* and *b* using saturation, and return the results.

_mm512_mask_adds_epi8

```
__m512i _mm512_mask_adds_epi8(__m512i src, __mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpaddsb

Add packed 8-bit integers in *a* and *b* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_adds_epi8

```
__m512i _mm512_maskz_adds_epi8(__mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpaddsb

Add packed 8-bit integers in *a* and *b* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_adds_epi16

```
__m128i _mm_mask_adds_epi16(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddsw

Add packed 16-bit integers in *a* and *b* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_adds_epi16

```
__m128i _mm_maskz_adds_epi16(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddsw

Add packed 16-bit integers in *a* and *b* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_adds_epi16

```
__m256i _mm256_mask_adds_epi16(__m256i src, __mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddsw

Add packed 16-bit integers in *a* and *b* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_adds_epi16

```
__m256i _mm256_maskz_adds_epi16(__mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddsw

Add packed 16-bit integers in *a* and *b* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_adds_epi16

```
__m512i _mm512_adds_epi16(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpaddsw

Add packed 16-bit integers in *a* and *b* using saturation, and return the results.

_mm512_mask_adds_epi16

```
__m512i _mm512_mask_adds_epi16(__m512i src, __mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpaddsw

Add packed 16-bit integers in *a* and *b* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_adds_epi16

```
__m512i _mm512_maskz_adds_epi16(__mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpaddsw

Add packed 16-bit integers in *a* and *b* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_adds_epu8

```
__m128i _mm_mask_adds_epu8(__m128i src, __mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddusb

Add packed unsigned 8-bit integers in *a* and *b* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_adds_epu8

```
__m128i _mm_maskz_adds_epu8(__mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddusb

Add packed unsigned 8-bit integers in *a* and *b* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_adds_epu8

```
__m256i _mm256_mask_adds_epu8(__m256i src, __mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddusb

Add packed unsigned 8-bit integers in *a* and *b* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_adds_epu8

```
__m256i _mm256_maskz_adds_epu8(__mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddusb

Add packed unsigned 8-bit integers in *a* and *b* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_adds_epu8

```
__m512i _mm512_adds_epu8(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpaddusb

Add packed unsigned 8-bit integers in *a* and *b* using saturation, and return the results.

_mm512_mask_adds_epu8

```
__m512i _mm512_mask_adds_epu8(__m512i src, __mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpaddusb

Add packed unsigned 8-bit integers in *a* and *b* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_adds_epu8

```
__m512i _mm512_maskz_adds_epu8(__mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpaddusb

Add packed unsigned 8-bit integers in *a* and *b* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_adds_epu16

```
__m128i _mm_mask_adds_epu16(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddusw

Add packed unsigned 16-bit integers in *a* and *b* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_adds_epu16

```
__m128i _mm_maskz_adds_epu16(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddusw

Add packed unsigned 16-bit integers in *a* and *b* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_adds_epu16

```
__m256i _mm256_mask_adds_epu16(__m256i src, __mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddusw

Add packed unsigned 16-bit integers in *a* and *b* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_adds_epu16

```
__m256i _mm256_maskz_adds_epu16(__mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddusw

Add packed unsigned 16-bit integers in *a* and *b* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_adds_epu16

```
__m512i _mm512_adds_epu16(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpaddusw

Add packed unsigned 16-bit integers in *a* and *b* using saturation, and return the results.

_mm512_mask_adds_epu16

```
__m512i _mm512_mask_adds_epu16(__m512i src, __mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpaddusw

Add packed unsigned 16-bit integers in *a* and *b* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_adds_epu16

```
__m512i _mm512_maskz_adds_epu16(__mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpaddusw

Add packed unsigned 16-bit integers in *a* and *b* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_add_epi16

```
__m128i _mm_mask_add_epi16(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddw

Add packed 16-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_add_epi16

```
__m128i _mm_maskz_add_epi16(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddw

Add packed 16-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_add_epi16

```
__m256i _mm256_mask_add_epi16(__m256i src, __mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddw

Add packed 16-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_add_epi16

```
__m256i _mm256_maskz_add_epi16(__mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpaddw

Add packed 16-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_add_epi16

```
__m512i _mm512_add_epi16(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpaddw

Add packed 16-bit integers in *a* and *b*, and return the results.

_mm512_mask_add_epi16

```
__m512i _mm512_mask_add_epi16(__m512i src, __mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpaddw

Add packed 16-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_add_epi16

```
__m512i _mm512_maskz_add_epi16(__mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpaddw

Add packed 16-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_avg_epu8

```
__m128i _mm_mask_avg_epu8(__m128i src, __mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpavgb

Average packed unsigned 8-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_avg_epu8

```
__m128i _mm_maskz_avg_epu8(__mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpavgb

Average packed unsigned 8-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_avg_epu8

```
__m256i _mm256_mask_avg_epu8(__m256i src, __mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpavgb

Average packed unsigned 8-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_avg_epu8

```
__m256i _mm256_maskz_avg_epu8(__mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpavgb

Average packed unsigned 8-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_avg_epu8

```
__m512i _mm512_avg_epu8(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpavgb

Average packed unsigned 8-bit integers in *a* and *b*, and return the results.

_mm512_mask_avg_epu8

```
__m512i _mm512_mask_avg_epu8(__m512i src, __mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpavgb

Average packed unsigned 8-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_avg_epu8

```
__m512i _mm512_maskz_avg_epu8(__mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpavgb

Average packed unsigned 8-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_avg_epu16

```
__m128i _mm_mask_avg_epu16(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpavgw

Average packed unsigned 16-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_avg_epu16

```
__m128i _mm_maskz_avg_epu16(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpavgw

Average packed unsigned 16-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_avg_epu16

```
__m256i _mm256_mask_avg_epu16(__m256i src, __mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpavgw

Average packed unsigned 16-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_avg_epu16

```
__m256i _mm256_maskz_avg_epu16(__mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpavgw

Average packed unsigned 16-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_avg_epu16

```
__m512i _mm512_avg_epu16(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpavgw

Average packed unsigned 16-bit integers in *a* and *b*, and return the results.

_mm512_mask_avg_epu16

```
__m512i _mm512_mask_avg_epu16(__m512i src, __mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpavgw

Average packed unsigned 16-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_avg_epu16

```
__m512i _mm512_maskz_avg_epu16(__mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpavgw

Average packed unsigned 16-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_maddubs_epi16

```
__m128i _mm_mask_maddubs_epi16(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaddubsw

Multiply packed unsigned 8-bit integers in *a* by packed signed 8-bit integers in *b*, producing intermediate signed 16-bit integers. Horizontally add adjacent pairs of intermediate signed 16-bit integers, and pack the saturated results in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_maddubs_epi16

```
__m128i _mm_maskz_maddubs_epi16(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaddubsw

Multiply packed unsigned 8-bit integers in *a* by packed signed 8-bit integers in *b*, producing intermediate signed 16-bit integers. Horizontally add adjacent pairs of intermediate signed 16-bit integers, and pack the saturated results in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_maddubs_epi16

```
__m256i _mm256_mask_maddubs_epi16(__m256i src, __mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaddubsw

Multiply packed unsigned 8-bit integers in *a* by packed signed 8-bit integers in *b*, producing intermediate signed 16-bit integers. Horizontally add adjacent pairs of intermediate signed 16-bit integers, and pack the saturated results in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_maddubs_epi16

```
__m256i _mm256_maskz_maddubs_epi16(__mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaddubsw

Multiply packed unsigned 8-bit integers in *a* by packed signed 8-bit integers in *b*, producing intermediate signed 16-bit integers. Horizontally add adjacent pairs of intermediate signed 16-bit integers, and pack the saturated results in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_maddubs_epi16

```
__m512i _mm512_maddubs_epi16(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmaddubsw

Vertically multiply each unsigned 8-bit integer from *a* with the corresponding signed 8-bit integer from *b*, producing intermediate signed 16-bit integers. Horizontally add adjacent pairs of intermediate signed 16-bit integers, and pack the saturated results in the return value.

_mm512_mask_maddubs_epi16

```
__m512i _mm512_mask_maddubs_epi16(__m512i src, __mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmaddubsw

Multiply packed unsigned 8-bit integers in *a* by packed signed 8-bit integers in *b*, producing intermediate signed 16-bit integers. Horizontally add adjacent pairs of intermediate signed 16-bit integers, and pack the saturated results in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_maddubs_epi16

```
__m512i _mm512_maskz_maddubs_epi16(__mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmaddubsw

Multiply packed unsigned 8-bit integers in *a* by packed signed 8-bit integers in *b*, producing intermediate signed 16-bit integers. Horizontally add adjacent pairs of intermediate signed 16-bit integers, and pack the saturated results in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_madd_epi16

```
__m128i _mm_mask_madd_epi16(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaddwd

Multiply packed 16-bit integers in *a* and *b*, producing intermediate 32-bit integers. Horizontally add adjacent pairs of intermediate 32-bit integers, and pack the saturated results in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_madd_epi16

```
__m128i _mm_maskz_madd_epi16(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaddwd

Multiply packed 16-bit integers in *a* and *b*, producing intermediate 32-bit integers. Horizontally add adjacent pairs of intermediate 32-bit integers, and pack the saturated results in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_madd_epi16

```
__m256i _mm256_mask_madd_epi16(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaddwd

Multiply packed 16-bit integers in *a* and *b*, producing intermediate 32-bit integers. Horizontally add adjacent pairs of intermediate 32-bit integers, and pack the saturated results in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_madd_epi16

```
__m256i _mm256_maskz_madd_epi16(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaddwd

Multiply packed 16-bit integers in *a* and *b*, producing intermediate 32-bit integers. Horizontally add adjacent pairs of intermediate 32-bit integers, and pack the saturated results in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_madd_epi16

```
__m512i _mm512_madd_epi16(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmaddwd

Multiply packed 16-bit integers in *a* and *b*, producing intermediate 32-bit integers. Horizontally add adjacent pairs of intermediate 32-bit integers, and pack the saturated results in the return value.

_mm512_mask_madd_epi16

```
__m512i _mm512_mask_madd_epi16(__m512i src, __mmask16 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmaddwd

Multiply packed 16-bit integers in *a* and *b*, producing intermediate 32-bit integers. Horizontally add adjacent pairs of intermediate 32-bit integers, and pack the saturated results in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_madd_epi16

```
__m512i _mm512_maskz_madd_epi16(__mmask16 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmaddwd

Multiply packed 16-bit integers in *a* and *b*, producing intermediate 32-bit integers. Horizontally add adjacent pairs of intermediate 32-bit integers, and pack the saturated results in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_max_epi8

```
__m128i _mm_mask_max_epi8(__m128i src, __mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaxsb

Compare packed 8-bit integers in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_max_epi8

```
__m128i _mm_maskz_max_epi8(__mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaxsb

Compare packed 8-bit integers in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_max_epi8

```
__m256i _mm256_mask_max_epi8(__m256i src, __mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaxsb

Compare packed 8-bit integers in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_max_epi8

```
__m256i _mm256_maskz_max_epi8(__mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaxsb

Compare packed 8-bit integers in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_max_epi8

```
__m512i _mm512_mask_max_epi8(__m512i src, __mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmaxsb

Compare packed 8-bit integers in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_max_epi8

```
__m512i _mm512_maskz_max_epi8(__mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmaxsb

Compare packed 8-bit integers in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_max_epi8

```
__m512i _mm512_max_epi8(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmaxsb

Compare packed 8-bit integers in *a* and *b*, and store packed maximum values in the return value.

_mm_mask_max_epi32

```
__m128i _mm_mask_max_epi32(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmaxsd

Compare packed 32-bit integers in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_max_epi32

```
__m128i _mm_maskz_max_epi32(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmaxsd

Compare packed 32-bit integers in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_max_epi32

```
__m256i _mm256_mask_max_epi32(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmaxsd

Compare packed 32-bit integers in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_max_epi32

```
__m256i _mm256_maskz_max_epi32(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmaxsd

Compare packed 32-bit integers in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_max_epi64

```
__m128i _mm_mask_max_epi64(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmaxsq

Compare packed 64-bit integers in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_max_epi64

```
__m128i _mm_maskz_max_epi64(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmaxsq

Compare packed 64-bit integers in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_max_epi64

```
__m128i _mm_max_epi64(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmaxsq

Compare packed 64-bit integers in *a* and *b*, and store packed maximum values in the return value.

_mm256_mask_max_epi64

```
__m256i _mm256_mask_max_epi64(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmaxsq

Compare packed 64-bit integers in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_max_epi64

```
__m256i _mm256_maskz_max_epi64(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmaxsq

Compare packed 64-bit integers in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_max_epi64

```
__m256i _mm256_max_epi64(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmaxsq

Compare packed 64-bit integers in *a* and *b*, and store packed maximum values in the return value.

_mm_mask_max_epi16

```
__m128i _mm_mask_max_epi16(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaxsw

Compare packed 16-bit integers in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_max_epi16

```
__m128i _mm_maskz_max_epi16(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaxsw

Compare packed 16-bit integers in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_max_epi16

```
__m256i _mm256_mask_max_epi16(__m256i src, __mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaxsw

Compare packed 16-bit integers in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_max_epi16

```
__m256i _mm256_maskz_max_epi16(__mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaxsw

Compare packed 16-bit integers in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_max_epi16

```
__m512i _mm512_mask_max_epi16(__m512i src, __mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmaxsw

Compare packed 16-bit integers in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_max_epi16

```
__m512i _mm512_maskz_max_epi16(__mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmaxsw

Compare packed 16-bit integers in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_max_epi16

```
__m512i _mm512_max_epi16(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmaxsw

Compare packed 16-bit integers in *a* and *b*, and store packed maximum values in the return value.

_mm_mask_max_epu8

```
__m128i _mm_mask_max_epu8(__m128i src, __mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaxub

Compare packed unsigned 8-bit integers in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_max_epu8

```
__m128i _mm_maskz_max_epu8(__mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaxub

Compare packed unsigned 8-bit integers in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_max_epu8

```
__m256i _mm256_mask_max_epu8(__m256i src, __mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaxub

Compare packed unsigned 8-bit integers in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_max_epu8

```
__m256i _mm256_maskz_max_epu8(__mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaxub

Compare packed unsigned 8-bit integers in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_max_epu8

```
__m512i _mm512_mask_max_epu8(__m512i src, __mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmaxub

Compare packed unsigned 8-bit integers in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_max_epu8

```
__m512i _mm512_maskz_max_epu8(__mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmaxub

Compare packed unsigned 8-bit integers in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_max_epu8

```
__m512i _mm512_max_epu8(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmaxub

Compare packed unsigned 8-bit integers in *a* and *b*, and store packed maximum values in the return value.

_mm_mask_max_epu32

```
__m128i _mm_mask_max_epu32(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmaxud

Compare packed unsigned 32-bit integers in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_max_epu32

```
__m128i _mm_maskz_max_epu32(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmaxud

Compare packed unsigned 32-bit integers in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_max_epu32

```
__m256i _mm256_mask_max_epu32(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmaxud

Compare packed unsigned 32-bit integers in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_max_epu32

```
__m256i _mm256_maskz_max_epu32(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmaxud

Compare packed unsigned 32-bit integers in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_max_epu64

```
__m128i _mm_mask_max_epu64(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmaxuq

Compare packed unsigned 64-bit integers in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_max_epu64

```
__m128i _mm_maskz_max_epu64(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmaxuq

Compare packed unsigned 64-bit integers in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_max_epu64

```
__m128i _mm_max_epu64(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmaxuq

Compare packed unsigned 64-bit integers in *a* and *b*, and store packed maximum values in the return value.

_mm256_mask_max_epu64

```
__m256i _mm256_mask_max_epu64(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmaxuq

Compare packed unsigned 64-bit integers in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_max_epu64

```
__m256i _mm256_maskz_max_epu64(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmaxuq

Compare packed unsigned 64-bit integers in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_max_epu64

```
__m256i _mm256_max_epu64(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmaxuq

Compare packed unsigned 64-bit integers in *a* and *b*, and store packed maximum values in the return value.

_mm_mask_max_epu16

```
__m128i _mm_mask_max_epu16(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaxuw

Compare packed unsigned 16-bit integers in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_max_epu16

```
__m128i _mm_maskz_max_epu16(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaxuw

Compare packed unsigned 16-bit integers in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_max_epu16

```
__m256i _mm256_mask_max_epu16(__m256i src, __mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaxuw

Compare packed unsigned 16-bit integers in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_max_epu16

```
__m256i _mm256_maskz_max_epu16(__mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmaxuw

Compare packed unsigned 16-bit integers in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_max_epu16

```
__m512i _mm512_mask_max_epu16(__m512i src, __mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmaxuw

Compare packed unsigned 16-bit integers in *a* and *b*, and store packed maximum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_max_epu16

```
__m512i _mm512_maskz_max_epu16(__mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmaxuw

Compare packed unsigned 16-bit integers in *a* and *b*, and store packed maximum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_max_epu16

```
__m512i _mm512_max_epu16(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmaxuw

Compare packed unsigned 16-bit integers in *a* and *b*, and store packed maximum values in the return value.

_mm_mask_min_epi8

```
__m128i _mm_mask_min_epi8(__m128i src, __mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpminsb

Compare packed 8-bit integers in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_min_epi8

```
__m128i _mm_maskz_min_epi8(__mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpminsb

Compare packed 8-bit integers in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_min_epi8

```
__m256i _mm256_mask_min_epi8(__m256i src, __mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpminsb

Compare packed 8-bit integers in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_min_epi8

```
__m256i _mm256_maskz_min_epi8(__mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpminsb

Compare packed 8-bit integers in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_min_epi8

```
__m512i _mm512_mask_min_epi8(__m512i src, __mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpminsb

Compare packed 8-bit integers in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_min_epi8

```
__m512i _mm512_maskz_min_epi8(__mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpminsb

Compare packed 8-bit integers in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_min_epi8

```
__m512i _mm512_min_epi8(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpminsb

Compare packed 8-bit integers in *a* and *b*, and store packed minimum values in the return value.

_mm_mask_min_epi32

```
__m128i _mm_mask_min_epi32(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpminsd

Compare packed 32-bit integers in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_min_epi32

```
__m128i _mm_maskz_min_epi32(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpminsd

Compare packed 32-bit integers in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_min_epi32

```
__m256i _mm256_mask_min_epi32(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpminsd

Compare packed 32-bit integers in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_min_epi32

```
__m256i _mm256_maskz_min_epi32(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpminsd

Compare packed 32-bit integers in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_min_epi64

```
__m128i _mm_mask_min_epi64(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpminsq

Compare packed 64-bit integers in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_min_epi64

```
__m128i _mm_maskz_min_epi64(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpminsq

Compare packed 64-bit integers in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_min_epi64

```
__m128i _mm_min_epi64(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpminsq

Compare packed 64-bit integers in *a* and *b*, and store packed minimum values in the return value.

_mm256_mask_min_epi64

```
__m256i _mm256_mask_min_epi64(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpminsq

Compare packed 64-bit integers in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_min_epi64

```
__m256i _mm256_maskz_min_epi64(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpminsq

Compare packed 64-bit integers in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_min_epi64

```
__m256i _mm256_min_epi64(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpminsq

Compare packed 64-bit integers in *a* and *b*, and store packed minimum values in the return value.

_mm_mask_min_epi16

```
__m128i _mm_mask_min_epi16(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpminsw

Compare packed 16-bit integers in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_min_epi16

```
__m128i _mm_maskz_min_epi16(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpminsw

Compare packed 16-bit integers in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_min_epi16

```
__m256i _mm256_mask_min_epi16(__m256i src, __mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpminsw

Compare packed 16-bit integers in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_min_epi16

```
__m256i _mm256_maskz_min_epi16(__mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpminsw

Compare packed 16-bit integers in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_min_epi16

```
__m512i _mm512_mask_min_epi16(__m512i src, __mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpminsw

Compare packed 16-bit integers in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_min_epi16

```
__m512i _mm512_maskz_min_epi16(__mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpminsw

Compare packed 16-bit integers in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_min_epi16

```
__m512i _mm512_min_epi16(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpminsw

Compare packed 16-bit integers in *a* and *b*, and store packed minimum values in the return value.

_mm_mask_min_epu8

```
__m128i _mm_mask_min_epu8(__m128i src, __mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpminub

Compare packed unsigned 8-bit integers in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_min_epu8

```
__m128i _mm_maskz_min_epu8(__mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpminub

Compare packed unsigned 8-bit integers in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_min_epu8

```
__m256i _mm256_mask_min_epu8(__m256i src, __mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpminub

Compare packed unsigned 8-bit integers in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_min_epu8

```
__m256i _mm256_maskz_min_epu8(__mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpminub

Compare packed unsigned 8-bit integers in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_min_epu8

```
__m512i _mm512_mask_min_epu8(__m512i src, __mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpminub

Compare packed unsigned 8-bit integers in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_min_epu8

```
__m512i _mm512_maskz_min_epu8(__mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpminub

Compare packed unsigned 8-bit integers in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_min_epu8

```
__m512i _mm512_min_epu8(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpminub

Compare packed unsigned 8-bit integers in *a* and *b*, and store packed minimum values in the return value.

_mm_mask_min_epu32

```
__m128i _mm_mask_min_epu32(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpminud

Compare packed unsigned 32-bit integers in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_min_epu32

```
__m128i _mm_maskz_min_epu32(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpminud

Compare packed unsigned 32-bit integers in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_min_epu32

```
__m256i _mm256_mask_min_epu32(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpminud

Compare packed unsigned 32-bit integers in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_min_epu32

```
__m256i _mm256_maskz_min_epu32(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpminud

Compare packed unsigned 32-bit integers in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_min_epu64

```
__m128i _mm_mask_min_epu64(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpminuq

Compare packed unsigned 64-bit integers in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_min_epu64

```
__m128i _mm_maskz_min_epu64(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpminuq

Compare packed unsigned 64-bit integers in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_min_epu64

```
__m128i _mm_min_epu64(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpminuq

Compare packed unsigned 64-bit integers in *a* and *b*, and store packed minimum values in the return value.

_mm256_mask_min_epu64

```
__m256i _mm256_mask_min_epu64(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpminuq

Compare packed unsigned 64-bit integers in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_min_epu64

```
__m256i _mm256_maskz_min_epu64(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpminuq

Compare packed unsigned 64-bit integers in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_min_epu64

```
__m256i _mm256_min_epu64(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpminuq

Compare packed unsigned 64-bit integers in *a* and *b*, and store packed minimum values in the return value.

_mm_mask_min_epu16

```
__m128i _mm_mask_min_epu16(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpminuw

Compare packed unsigned 16-bit integers in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_min_epu16

```
__m128i _mm_maskz_min_epu16(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpminuw

Compare packed unsigned 16-bit integers in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_min_epu16

```
__m256i _mm256_mask_min_epu16(__m256i src, __mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpminuw

Compare packed unsigned 16-bit integers in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_min_epu16

```
__m256i _mm256_maskz_min_epu16(__mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpminuw

Compare packed unsigned 16-bit integers in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_min_epu16

```
__m512i _mm512_mask_min_epu16(__m512i src, __mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpminuw

Compare packed unsigned 16-bit integers in *a* and *b*, and store packed minimum values in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_min_epu16

```
__m512i _mm512_maskz_min_epu16(__mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpminuw

Compare packed unsigned 16-bit integers in *a* and *b*, and store packed minimum values in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_min_epu16

```
__m512i _mm512_min_epu16(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpminuw

Compare packed unsigned 16-bit integers in *a* and *b*, and store packed minimum values in the return value.

_mm_mask_mul_epi32

```
__m128i _mm_mask_mul_epi32(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmuldq

Multiply the low 32-bit integers from each packed 64-bit element in *a* and *b*, and store the signed 64-bit results in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_mul_epi32

```
__m128i _mm_maskz_mul_epi32(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmuldq

Multiply the low 32-bit integers from each packed 64-bit element in *a* and *b*, and store the signed 64-bit results in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_mul_epi32

```
__m256i _mm256_mask_mul_epi32(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmuldq

Multiply the low 32-bit integers from each packed 64-bit element in *a* and *b*, and store the signed 64-bit results in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_mul_epi32

```
__m256i _mm256_maskz_mul_epi32(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmuldq

Multiply the low 32-bit integers from each packed 64-bit element in *a* and *b*, and store the signed 64-bit results in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_mulhrs_epi16

```
__m128i _mm_mask_mulhrs_epi16(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmulhrsw

Multiply packed 16-bit integers in *a* and *b*, producing intermediate signed 32-bit integers. Truncate each intermediate integer to the 18 most significant bits, round by adding 1, and store bits [16:1] to the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_mulhrs_epi16

```
__m128i _mm_maskz_mulhrs_epi16(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmulhrsw

Multiply packed 16-bit integers in *a* and *b*, producing intermediate signed 32-bit integers. Truncate each intermediate integer to the 18 most significant bits, round by adding 1, and store bits [16:1] to the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_mulhrs_epi16

```
__m256i _mm256_mask_mulhrs_epi16(__m256i src, __mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmulhrsw

Multiply packed 16-bit integers in *a* and *b*, producing intermediate signed 32-bit integers. Truncate each intermediate integer to the 18 most significant bits, round by adding 1, and store bits [16:1] to the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_mulhrs_epi16

```
__m256i _mm256_maskz_mulhrs_epi16(__mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmulhrsw

Multiply packed 16-bit integers in *a* and *b*, producing intermediate signed 32-bit integers. Truncate each intermediate integer to the 18 most significant bits, round by adding 1, and store bits [16:1] to the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_mulhrs_epi16

```
__m512i _mm512_mask_mulhrs_epi16(__m512i src, __mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmulhrsw

Multiply packed 16-bit integers in *a* and *b*, producing intermediate signed 32-bit integers. Truncate each intermediate integer to the 18 most significant bits, round by adding 1, and store bits [16:1] to the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_mulhrs_epi16

```
__m512i _mm512_maskz_mulhrs_epi16(__mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmulhrsw

Multiply packed 16-bit integers in *a* and *b*, producing intermediate signed 32-bit integers. Truncate each intermediate integer to the 18 most significant bits, round by adding 1, and store bits [16:1] to the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mulhrs_epi16

```
__m512i _mm512_mulhrs_epi16(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmulhrsw

Multiply packed 16-bit integers in *a* and *b*, producing intermediate signed 32-bit integers. Truncate each intermediate integer to the 18 most significant bits, round by adding 1, and store bits [16:1] to the return value.

_mm_mask_mulhi_epu16

```

CPUID Flags: AVX512BW

Instruction(s): vpmulhuw

Multiply the packed unsigned 16-bit integers in *a* and *b*, producing intermediate 32-bit integers, and store the high 16 bits of the intermediate integers in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_mulhi_epu16

```
__m512i _mm512_maskz_mulhi_epu16(__mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmulhuw

Multiply the packed unsigned 16-bit integers in *a* and *b*, producing intermediate 32-bit integers, and store the high 16 bits of the intermediate integers in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mulhi_epu16

```
__m512i _mm512_mulhi_epu16(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmulhuw

Multiply the packed unsigned 16-bit integers in *a* and *b*, producing intermediate 32-bit integers, and store the high 16 bits of the intermediate integers in the return value.

_mm_mask_mulhi_epi16

```
__m128i _mm_mask_mulhi_epi16(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmulhw

Multiply the packed 16-bit integers in *a* and *b*, producing intermediate 32-bit integers, and store the high 16 bits of the intermediate integers in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_mulhi_epi16

```
__m128i _mm_maskz_mulhi_epi16(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmulhw

Multiply the packed 16-bit integers in *a* and *b*, producing intermediate 32-bit integers, and store the high 16 bits of the intermediate integers in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_mulhi_epi16

```
__m256i _mm256_mask_mulhi_epi16(__m256i src, __mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmulhw

Multiply the packed 16-bit integers in *a* and *b*, producing intermediate 32-bit integers, and store the high 16 bits of the intermediate integers in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_mulhi_epi16

```
__m256i _mm256_maskz_mulhi_epi16(__mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmulhw

Multiply the packed 16-bit integers in *a* and *b*, producing intermediate 32-bit integers, and store the high 16 bits of the intermediate integers in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_mulhi_epi16

```
__m512i _mm512_mask_mulhi_epi16(__m512i src, __mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmulhw

Multiply the packed 16-bit integers in *a* and *b*, producing intermediate 32-bit integers, and store the high 16 bits of the intermediate integers in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_mulhi_epi16

```
__m512i _mm512_maskz_mulhi_epi16(__mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmulhw

Multiply the packed 16-bit integers in *a* and *b*, producing intermediate 32-bit integers, and store the high 16 bits of the intermediate integers in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mulhi_epi16

```
__m512i _mm512_mulhi_epi16(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmulhw

Multiply the packed 16-bit integers in *a* and *b*, producing intermediate 32-bit integers, and store the high 16 bits of the intermediate integers in the return value.

_mm_mask_mullo_epi32

```
__m128i _mm_mask_mullo_epi32(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmulld

Multiply the packed 32-bit integers in *a* and *b*, producing intermediate 64-bit integers, and store the low 32 bits of the intermediate integers in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_mullo_epi32

```
__m128i _mm_maskz_mullo_epi32(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmulld

Multiply the packed 32-bit integers in *a* and *b*, producing intermediate 64-bit integers, and store the low 32 bits of the intermediate integers in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_mullo_epi32

```
__m256i _mm256_mask_mullo_epi32(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmulld

Multiply the packed 32-bit integers in *a* and *b*, producing intermediate 64-bit integers, and store the low 32 bits of the intermediate integers in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_mullo_epi32

```
__m256i _mm256_maskz_mullo_epi32(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmulld

Multiply the packed 32-bit integers in *a* and *b*, producing intermediate 64-bit integers, and store the low 32 bits of the intermediate integers in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_mullo_epi64

```
__m128i _mm_mask_mullo_epi64(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vpmullq

Multiply the packed 64-bit integers in *a* and *b*, producing intermediate 128-bit integers, and store the low 64 bits of the intermediate integers in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_mullo_epi64

```
__m128i _mm_maskz_mullo_epi64(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vpmullq

Multiply the packed 64-bit integers in *a* and *b*, producing intermediate 128-bit integers, and store the low 64 bits of the intermediate integers in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mullo_epi64

```
__m128i _mm_mullo_epi64(__m128i a, __m128i b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vpmullq

Multiply the packed 64-bit integers in *a* and *b*, producing intermediate 128-bit integers, and store the low 64 bits of the intermediate integers in the return value.

_mm256_mask_mullo_epi64

```
__m256i _mm256_mask_mullo_epi64(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vpmullq

Multiply the packed 64-bit integers in *a* and *b*, producing intermediate 128-bit integers, and store the low 64 bits of the intermediate integers in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_mullo_epi64

```
__m256i _mm256_maskz_mullo_epi64(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vpmullq

Multiply the packed 64-bit integers in *a* and *b*, producing intermediate 128-bit integers, and store the low 64 bits of the intermediate integers in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mullo_epi64

```
__m256i _mm256_mullo_epi64(__m256i a, __m256i b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vpmullq

Multiply the packed 64-bit integers in *a* and *b*, producing intermediate 128-bit integers, and store the low 64 bits of the intermediate integers in the return value.

_mm512_mask_mullo_epi64

```
__m512i _mm512_mask_mullo_epi64(__m512i src, __mmask8 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512DQ

Instruction(s): vpmullq

Multiply the packed 64-bit integers in *a* and *b*, producing intermediate 128-bit integers, and store the low 64 bits of the intermediate integers in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_mullo_epi64

```
__m512i _mm512_maskz_mullo_epi64(__mmask8 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512DQ

Instruction(s): vpmullq

Multiply the packed 64-bit integers in *a* and *b*, producing intermediate 128-bit integers, and store the low 64 bits of the intermediate integers in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mullo_epi64

```
__m512i _mm512_mullo_epi64(__m512i a, __m512i b)
```

CPUID Flags: AVX512DQ

Instruction(s): vpmullq

Multiply the packed 64-bit integers in *a* and *b*, producing intermediate 128-bit integers, and store the low 64 bits of the intermediate integers in the return value.

_mm_mask_mullo_epi16

```
__m128i _mm_mask_mullo_epi16(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmullw

Multiply the packed 16-bit integers in *a* and *b*, producing intermediate 32-bit integers, and store the low 16 bits of the intermediate integers in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_mullo_epi16

```
__m128i _mm_maskz_mullo_epi16(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmullw

Multiply the packed 16-bit integers in *a* and *b*, producing intermediate 32-bit integers, and store the low 16 bits of the intermediate integers in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_mullo_epi16

```
__m256i _mm256_mask_mullo_epi16(__m256i src, __mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmullw

Multiply the packed 16-bit integers in *a* and *b*, producing intermediate 32-bit integers, and store the low 16 bits of the intermediate integers in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_mullo_epi16

```
__m256i _mm256_maskz_mullo_epi16(__mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmullw

Multiply the packed 16-bit integers in *a* and *b*, producing intermediate 32-bit integers, and store the low 16 bits of the intermediate integers in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_mullo_epi16

```
__m512i _mm512_mask_mullo_epi16(__m512i src, __mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmullw

Multiply the packed 16-bit integers in *a* and *b*, producing intermediate 32-bit integers, and store the low 16 bits of the intermediate integers in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_mullo_epi16

```
__m512i _mm512_maskz_mullo_epi16(__mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmullw

Multiply the packed 16-bit integers in *a* and *b*, producing intermediate 32-bit integers, and store the low 16 bits of the intermediate integers in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mullo_epi16

```
__m512i _mm512_mullo_epi16(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpmullw

Multiply the packed 16-bit integers in *a* and *b*, producing intermediate 32-bit integers, and store the low 16 bits of the intermediate integers in the return value.

_mm_mask_mul_epu32

```
__m128i _mm_mask_mul_epu32(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmuludq

Multiply the low unsigned 32-bit integers from each packed 64-bit element in *a* and *b*, and store the unsigned 64-bit results in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_mul_epu32

```
__m128i _mm_maskz_mul_epu32(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmuludq

Multiply the low unsigned 32-bit integers from each packed 64-bit element in *a* and *b*, and store the unsigned 64-bit results in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_mul_epu32

```
__m256i _mm256_mask_mul_epu32(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmuludq

Multiply the low unsigned 32-bit integers from each packed 64-bit element in *a* and *b*, and store the unsigned 64-bit results in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_mul_epu32

```
__m256i _mm256_maskz_mul_epu32(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmuludq

Multiply the low unsigned 32-bit integers from each packed 64-bit element in *a* and *b*, and store the unsigned 64-bit results in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_sub_epi8

```
__m128i _mm_mask_sub_epi8(__m128i src, __mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubb

Subtract packed 8-bit integers in *b* from packed 8-bit integers in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_sub_epi8

```
__m128i _mm_maskz_sub_epi8(__mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubb

Subtract packed 8-bit integers in *b* from packed 8-bit integers in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_sub_epi8

```
__m256i _mm256_mask_sub_epi8(__m256i src, __mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubb

Subtract packed 8-bit integers in *b* from packed 8-bit integers in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_sub_epi8

```
__m256i _mm256_maskz_sub_epi8(__mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubb

Subtract packed 8-bit integers in *b* from packed 8-bit integers in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_sub_epi8

```
__m512i _mm512_mask_sub_epi8(__m512i src, __mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpsubb

Subtract packed 8-bit integers in *b* from packed 8-bit integers in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_sub_epi8

```
__m512i _mm512_maskz_sub_epi8(__mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpsubb

Subtract packed 8-bit integers in *b* from packed 8-bit integers in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_sub_epi8

```
__m512i _mm512_sub_epi8(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpsubb

Subtract packed 8-bit integers in *b* from packed 8-bit integers in *a*, and return the results.

_mm_mask_sub_epi32

```
__m128i _mm_mask_sub_epi32(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsubd

Subtract packed 32-bit integers in *b* from packed 32-bit integers in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_sub_epi32

```
__m128i _mm_maskz_sub_epi32(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsubd

Subtract packed 32-bit integers in *b* from packed 32-bit integers in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_sub_epi32

```
__m256i _mm256_mask_sub_epi32(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsubd

Subtract packed 32-bit integers in *b* from packed 32-bit integers in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_sub_epi32

```
__m256i _mm256_maskz_sub_epi32(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsubd

Subtract packed 32-bit integers in *b* from packed 32-bit integers in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_sub_epi64

```
__m128i _mm_mask_sub_epi64(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsubq

Subtract packed 64-bit integers in *b* from packed 64-bit integers in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_sub_epi64

```
__m128i _mm_maskz_sub_epi64(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsubq

Subtract packed 64-bit integers in *b* from packed 64-bit integers in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_sub_epi64

```
__m256i _mm256_mask_sub_epi64(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsubq

Subtract packed 64-bit integers in *b* from packed 64-bit integers in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_sub_epi64

```
__m256i _mm256_maskz_sub_epi64(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsubq

Subtract packed 64-bit integers in *b* from packed 64-bit integers in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_subs_epi8

```
__m128i _mm_mask_subs_epi8(__m128i src, __mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubsb

Subtract packed 8-bit integers in *b* from packed 8-bit integers in *a* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_subs_epi8

```
__m128i _mm_maskz_subs_epi8(__mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubsb

Subtract packed 8-bit integers in *b* from packed 8-bit integers in *a* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_subs_epi8

```
__m256i _mm256_mask_subs_epi8(__m256i src, __mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubsb

Subtract packed 8-bit integers in *b* from packed 8-bit integers in *a* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_subs_epi8

```
__m256i _mm256_maskz_subs_epi8(__mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubsb

Subtract packed 8-bit integers in *b* from packed 8-bit integers in *a* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_subs_epi8

```
__m512i _mm512_mask_subs_epi8(__m512i src, __mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpsubsb

Subtract packed 8-bit integers in *b* from packed 8-bit integers in *a* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_subs_epi8

```
__m512i _mm512_maskz_subs_epi8(__mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpsubsb

Subtract packed 8-bit integers in *b* from packed 8-bit integers in *a* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_subs_epi8

```
__m512i _mm512_subs_epi8(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpsubsb

Subtract packed 8-bit integers in *b* from packed 8-bit integers in *a* using saturation, and return the results.

_mm_mask_subs_epi16

```
__m128i _mm_mask_subs_epi16(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubsw

Subtract packed 16-bit integers in *b* from packed 16-bit integers in *a* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_subs_epi16

```
__m128i _mm_maskz_subs_epi16(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubsw

Subtract packed 16-bit integers in *b* from packed 16-bit integers in *a* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_subs_epi16

```
__m256i _mm256_mask_subs_epi16(__m256i src, __mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubsw

Subtract packed 16-bit integers in *b* from packed 16-bit integers in *a* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_subs_epi16

```
__m256i _mm256_maskz_subs_epi16(__mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubsw

Subtract packed 16-bit integers in *b* from packed 16-bit integers in *a* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_subs_epi16

```
__m512i _mm512_mask_subs_epi16(__m512i src, __mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpsubsw

Subtract packed 16-bit integers in *b* from packed 16-bit integers in *a* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_subs_epi16

```
__m512i _mm512_maskz_subs_epi16(__mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpsubsw

Subtract packed 16-bit integers in *b* from packed 16-bit integers in *a* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_subs_epi16

```
__m512i _mm512_subs_epi16(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpsubsw

Subtract packed 16-bit integers in *b* from packed 16-bit integers in *a* using saturation, and return the results.

_mm_mask_subs_epu8

```
__m128i _mm_mask_subs_epu8(__m128i src, __mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubusb

Subtract packed unsigned 8-bit integers in *b* from packed unsigned 8-bit integers in *a* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_subs_epu8

```
__m128i _mm_maskz_subs_epu8(__mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubusb

Subtract packed unsigned 8-bit integers in *b* from packed unsigned 8-bit integers in *a* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_subs_epu8

```
__m256i _mm256_mask_subs_epu8(__m256i src, __mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubusb

Subtract packed unsigned 8-bit integers in *b* from packed unsigned 8-bit integers in *a* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_subs_epu8

```
__m256i _mm256_maskz_subs_epu8(__mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubusb

Subtract packed unsigned 8-bit integers in *b* from packed unsigned 8-bit integers in *a* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_subs_epu8

```
__m512i _mm512_mask_subs_epu8(__m512i src, __mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpsubusb

Subtract packed unsigned 8-bit integers in *b* from packed unsigned 8-bit integers in *a* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_subs_epu8

```
__m512i _mm512_maskz_subs_epu8(__mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpsubusb

Subtract packed unsigned 8-bit integers in *b* from packed unsigned 8-bit integers in *a* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_subs_epu8

```
__m512i _mm512_subs_epu8(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpsubusb

Subtract packed unsigned 8-bit integers in *b* from packed unsigned 8-bit integers in *a* using saturation, and return the results.

_mm_mask_subs_epu16

```
__m128i _mm_mask_subs_epu16(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubusw

Subtract packed unsigned 16-bit integers in *b* from packed unsigned 16-bit integers in *a* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_subs_epu16

```
__m128i _mm_maskz_subs_epu16(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubusw

Subtract packed unsigned 16-bit integers in *b* from packed unsigned 16-bit integers in *a* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_subs_epu16

```
__m256i _mm256_mask_subs_epu16(__m256i src, __mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubusw

Subtract packed unsigned 16-bit integers in *b* from packed unsigned 16-bit integers in *a* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_subs_epu16

```
__m256i _mm256_maskz_subs_epu16(__mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubusw

Subtract packed unsigned 16-bit integers in *b* from packed unsigned 16-bit integers in *a* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_subs_epu16

```
__m512i _mm512_mask_subs_epu16(__m512i src, __mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpsubusw

Subtract packed unsigned 16-bit integers in *b* from packed unsigned 16-bit integers in *a* using saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_subs_epu16

```
__m512i _mm512_maskz_subs_epu16(__mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpsubusw

Subtract packed unsigned 16-bit integers in *b* from packed unsigned 16-bit integers in *a* using saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_subs_epu16

```
__m512i _mm512_subs_epu16(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpsubusw

Subtract packed unsigned 16-bit integers in *b* from packed unsigned 16-bit integers in *a* using saturation, and return the results.

_mm_mask_sub_epi16

```
__m128i _mm_mask_sub_epi16(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubw

Subtract packed 16-bit integers in *b* from packed 16-bit integers in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_sub_epi16

```
__m128i _mm_maskz_sub_epi16(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubw

Subtract packed 16-bit integers in *b* from packed 16-bit integers in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_sub_epi16

```
__m256i _mm256_mask_sub_epi16(__m256i src, __mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubw

Subtract packed 16-bit integers in *b* from packed 16-bit integers in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_sub_epi16

```
__m256i _mm256_maskz_sub_epi16(__mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsubw

Subtract packed 16-bit integers in *b* from packed 16-bit integers in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_sub_epi16

```
__m512i _mm512_mask_sub_epi16(__m512i src, __mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpsubw

Subtract packed 16-bit integers in *b* from packed 16-bit integers in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_sub_epi16

```
__m512i _mm512_maskz_sub_epi16(__mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpsubw

Subtract packed 16-bit integers in *b* from packed 16-bit integers in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_sub_epi16

```
__m512i _mm512_sub_epi16(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpsubw

Subtract packed 16-bit integers in *b* from packed 16-bit integers in *a*, and return the results.

_mm_madd52hi_epu64

```
__m128i _mm_madd52hi_epu64(__m128i a, __m128i b, __m128i c);
```

CPUID Flags: AVX512IFMA52, AVX512VL

Instruction(s): vpmadd52huq

Multiply packed unsigned 52-bit integers in each 64-bit element of *b* and *c* to form a 104-bit intermediate result. Add the high 52-bit unsigned integer from the intermediate result with the corresponding unsigned 64-bit integer in *a*, and return the result.

_mm_mask_madd52hi_epu64

```
__m128i _mm_mask_madd52hi_epu64(__m128i a, __mmask8 k, __m128i b, __m128i c);
```

CPUID Flags: AVX512IFMA52, AVX512VL

Instruction(s): vpmadd52huq

Multiply packed unsigned 52-bit integers in each 64-bit element of *b* and *c* to form a 104-bit intermediate result. Add the high 52-bit unsigned integer from the intermediate result with the corresponding unsigned 64-bit integer in *a*, and return the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm_maskz_madd52hi_epu64

```
__m128i _mm_maskz_madd52hi_epu64(__mmask8 k, __m128i a, __m128i b, __m128i c);
```

CPUID Flags: AVX512IFMA52, AVX512VL

Instruction(s): vpmadd52huq

Multiply packed unsigned 52-bit integers in each 64-bit element of *b* and *c* to form a 104-bit intermediate result. Add the high 52-bit unsigned integer from the intermediate result with the corresponding unsigned 64-bit integer in *a*, and return the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_madd52hi_epu64

```
__m256i _mm256_madd52hi_epu64(__m256i a, __m256i b, __m256i c);
```

CPUID Flags: AVX512IFMA52, AVX512VL

Instruction(s): vpmadd52huq

Multiply packed unsigned 52-bit integers in each 64-bit element of *b* and *c* to form a 104-bit intermediate result. Add the high 52-bit unsigned integer from the intermediate result with the corresponding unsigned 64-bit integer in *a*, and return the result.

_mm256_mask_madd52hi_epu64

```
__m256i _mm256_mask_madd52hi_epu64(__m256i a, __mmask8 k, __m256i b, __m256i c);
```

CPUID Flags: AVX512IFMA52, AVX512VL

Instruction(s): vpmadd52huq

Multiply packed unsigned 52-bit integers in each 64-bit element of *b* and *c* to form a 104-bit intermediate result. Add the high 52-bit unsigned integer from the intermediate result with the corresponding unsigned 64-bit integer in *a*, and return the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm256_maskz_madd52hi_epu64

```
__m256i _mm256_maskz_madd52hi_epu64(__mmask8 k, __m256i a, __m256i b, __m256i c);
```

CPUID Flags: AVX512IFMA52, AVX512VL

Instruction(s): vpmadd52huq

Multiply packed unsigned 52-bit integers in each 64-bit element of *b* and *c* to form a 104-bit intermediate result. Add the high 52-bit unsigned integer from the intermediate result with the corresponding unsigned 64-bit integer in *a*, and return the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_madd52hi_epu64

```
__m512i _mm512_madd52hi_epu64(__m512i a, __m512i b, __m512i c);
```

CPUID Flags: AVX512IFMA52

Instruction(s): vpmadd52huq

Multiply packed unsigned 52-bit integers in each 64-bit element of *b* and *c* to form a 104-bit intermediate result. Add the high 52-bit unsigned integer from the intermediate result with the corresponding unsigned 64-bit integer in *a*, and return the result.

_mm512_mask_madd52hi_epu64

```
__m512i _mm512_mask_madd52hi_epu64(__m512i a, __mmask8 k, __m512i b, __m512i c);
```

CPUID Flags: AVX512IFMA52

Instruction(s): vpmadd52huq

Multiply packed unsigned 52-bit integers in each 64-bit element of *b* and *c* to form a 104-bit intermediate result. Add the high 52-bit unsigned integer from the intermediate result with the corresponding unsigned 64-bit integer in *a*, and return the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm512_maskz_madd52hi_epu64

```
__m512i _mm512_maskz_madd52hi_epu64(__mmask8 k, __m512i a, __m512i b, __m512i c);
```

CPUID Flags: AVX512IFMA52

Instruction(s): vpmadd52huq

Multiply packed unsigned 52-bit integers in each 64-bit element of *b* and *c* to form a 104-bit intermediate result. Add the high 52-bit unsigned integer from the intermediate result with the corresponding unsigned 64-bit integer in *a*, and return the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_madd52lo_epu64

```
__m128i _mm_madd52lo_epu64(__m128i a, __m128i b, __m128i c);
```

CPUID Flags: AVX512IFMA52, AVX512VL

Instruction(s): vpmadd52luq

Multiply packed unsigned 52-bit integers in each 64-bit element of *b* and *c* to form a 104-bit intermediate result. Add the low 52-bit unsigned integer from the intermediate result with the corresponding unsigned 64-bit integer in *a*, and return the result.

_mm_mask_madd52lo_epu64

```
__m128i _mm_mask_madd52lo_epu64(__m128i a, __mmask8 k, __m128i b, __m128i c);
```

CPUID Flags: AVX512IFMA52, AVX512VL

Instruction(s): vpmadd52luq

Multiply packed unsigned 52-bit integers in each 64-bit element of *b* and *c* to form a 104-bit intermediate result. Add the low 52-bit unsigned integer from the intermediate result with the corresponding unsigned 64-bit integer in *a*, and return the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm_maskz_madd52lo_epu64

```
__m128i _mm_maskz_madd52lo_epu64(__mmask8 k, __m128i a, __m128i b, __m128i c);
```

CPUID Flags: AVX512IFMA52, AVX512VL

Instruction(s): vpmadd52luq

Multiply packed unsigned 52-bit integers in each 64-bit element of *b* and *c* to form a 104-bit intermediate result. Add the low 52-bit unsigned integer from the intermediate result with the corresponding unsigned 64-bit integer in *a*, and return the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_madd52lo_epu64

```
__m256i _mm256_madd52lo_epu64(__m256i a, __m256i b, __m256i c);
```

CPUID Flags: AVX512IFMA52, AVX512VL

Instruction(s): vpmadd52luq

Multiply packed unsigned 52-bit integers in each 64-bit element of *b* and *c* to form a 104-bit intermediate result. Add the low 52-bit unsigned integer from the intermediate result with the corresponding unsigned 64-bit integer in *a*, and return the result.

_mm256_mask_madd52lo_epu64

```
__m256i _mm256_mask_madd52lo_epu64(__m256i a, __mmask8 k, __m256i b, __m256i c);
```

CPUID Flags: AVX512IFMA52, AVX512VL

Instruction(s): vpmadd52luq

Multiply packed unsigned 52-bit integers in each 64-bit element of *b* and *c* to form a 104-bit intermediate result. Add the low 52-bit unsigned integer from the intermediate result with the corresponding unsigned 64-bit integer in *a*, and return the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm256_maskz_madd52lo_epu64

```
__m256i _mm256_maskz_madd52lo_epu64(__mmask8 k, __m256i a, __m256i b, __m256i c);
```

CPUID Flags: AVX512IFMA52, AVX512VL

Instruction(s): vpmadd52luq

Multiply packed unsigned 52-bit integers in each 64-bit element of *b* and *c* to form a 104-bit intermediate result. Add the low 52-bit unsigned integer from the intermediate result with the corresponding unsigned 64-bit integer in *a*, and return the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_madd52lo_epu64

```
__m512i _mm512_madd52lo_epu64(__m512i a, __m512i b, __m512i c);
```

CPUID Flags: AVX512IFMA52

Instruction(s): vpmadd52luq

Multiply packed unsigned 52-bit integers in each 64-bit element of *b* and *c* to form a 104-bit intermediate result. Add the low 52-bit unsigned integer from the intermediate result with the corresponding unsigned 64-bit integer in *a*, and return the result.

_mm512_mask_madd52lo_epu64

```
__m512i _mm512_mask_madd52lo_epu64(__m512i a, __mmask8 k, __m512i b, __m512i c);
```

CPUID Flags: AVX512IFMA52

Instruction(s): vpmadd52luq

Multiply packed unsigned 52-bit integers in each 64-bit element of *b* and *c* to form a 104-bit intermediate result. Add the low 52-bit unsigned integer from the intermediate result with the corresponding unsigned 64-bit integer in *a*, and return the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm512_maskz_madd52lo_epu64

```
__m512i _mm512_maskz_madd52lo_epu64(__mmask8 k, __m512i a, __m512i b, __m512i c);
```

CPUID Flags: AVX512IFMA52

Instruction(s): vpmadd52luq

Multiply packed unsigned 52-bit integers in each 64-bit element of *b* and *c* to form a 104-bit intermediate result. Add the low 52-bit unsigned integer from the intermediate result with the corresponding unsigned 64-bit integer in *a*, and return the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

Intrinsics for Bit Manipulation Operations

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `zmmintrin.h` header file.
To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

variable	definition
src	source element to use based on writemask result
k	writemask used as a selector
a	first source vector element

_mm_lzcnt_epi32

```
__m128i _mm_lzcnt_epi32(__m128i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vplzcntd

Counts the number of leading zero bits in each packed 32-bit integer in *a*, and return the results.

_mm_mask_lzcnt_epi32

```
__m128i _mm_mask_lzcnt_epi32(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vplzcntd

Counts the number of leading zero bits in each packed 32-bit integer in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_lzcnt_epi32

```
__m128i _mm_maskz_lzcnt_epi32(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vplzcntd

Counts the number of leading zero bits in each packed 32-bit integer in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_lzcnt_epi32

```
__m256i _mm256_lzcnt_epi32(__m256i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vplzcntd

Counts the number of leading zero bits in each packed 32-bit integer in *a*, and return the results.

_mm256_mask_lzcnt_epi32

```
__m256i _mm256_mask_lzcnt_epi32(__m256i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vplzcntd

Counts the number of leading zero bits in each packed 32-bit integer in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_lzcnt_epi32

```
__m256i _mm256_maskz_lzcnt_epi32(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vplzcntd

Counts the number of leading zero bits in each packed 32-bit integer in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_lzcnt_epi64

```
__m128i _mm_lzcnt_epi64(__m128i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vplzcntq

Counts the number of leading zero bits in each packed 64-bit integer in *a*, and return the results.

_mm_mask_lzcnt_epi64

```
__m128i _mm_mask_lzcnt_epi64(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vplzcntq

Counts the number of leading zero bits in each packed 64-bit integer in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_lzcnt_epi64

```
__m128i _mm_maskz_lzcnt_epi64(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vplzcntq

Counts the number of leading zero bits in each packed 64-bit integer in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_lzcnt_epi64

```
__m256i _mm256_lzcnt_epi64(__m256i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vplzcntq

Counts the number of leading zero bits in each packed 64-bit integer in *a*, and return the results.

_mm256_mask_lzcnt_epi64

```
__m256i _mm256_mask_lzcnt_epi64(__m256i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vplzcntq

Counts the number of leading zero bits in each packed 64-bit integer in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_lzcnt_epi64

```
__m256i _mm256_maskz_lzcnt_epi64(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vplzcntq

Counts the number of leading zero bits in each packed 64-bit integer in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_multishift_epi64_epi8

```
__m128i _mm_multishift_epi64_epi8(__m128i a, __m128i b)
```

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpmultishiftqb

For each 64-bit element in *b*, select 8 unaligned bytes using a byte-granular shift control within the corresponding 64-bit element of *a*, and store the 8 assembled bytes to the corresponding 64-bit element of the return value.

_mm_mask_multishift_epi64_epi8

```
__m128i _mm_mask_multishift_epi64_epi8(__m128i src, __mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpmultishiftqb

For each 64-bit element in *b*, select 8 unaligned bytes using a byte-granular shift control within the corresponding 64-bit element of *a*, and store the 8 assembled bytes to the corresponding 64-bit element of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_multishift_epi64_epi8

```
__m128i _mm_maskz_multishift_epi64_epi8(__mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpmultishiftqb

For each 64-bit element in *b*, select 8 unaligned bytes using a byte-granular shift control within the corresponding 64-bit element of *a*, and store the 8 assembled bytes to the corresponding 64-bit element of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_multishift_epi64_epi8

```
__m256i _mm256_multishift_epi64_epi8(__m256i a, __m256i b)
```

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpmultishiftqb

For each 64-bit element in *b*, select 8 unaligned bytes using a byte-granular shift control within the corresponding 64-bit element of *a*, and store the 8 assembled bytes to the corresponding 64-bit element of the return value.

_mm256_mask_multishift_epi64_epi8

```
__m256i _mm256_mask_multishift_epi64_epi8(__m256i src, __mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpmultishiftqb

For each 64-bit element in *b*, select 8 unaligned bytes using a byte-granular shift control within the corresponding 64-bit element of *a*, and store the 8 assembled bytes to the corresponding 64-bit element of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_multishift_epi64_epi8

```
__m256i _mm256_maskz_multishift_epi64_epi8(__mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpmultishiftqb

For each 64-bit element in *b*, select 8 unaligned bytes using a byte-granular shift control within the corresponding 64-bit element of *a*, and store the 8 assembled bytes to the corresponding 64-bit element of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_multishift_epi64_epi8

```
__m512i _mm512_multishift_epi64_epi8(__m512i a, __m512i b)
```

CPUID Flags: AVX512VBMI

Instruction(s): vpmultishiftqb

For each 64-bit element in *b*, select 8 unaligned bytes using a byte-granular shift control within the corresponding 64-bit element of *a*, and store the 8 assembled bytes to the corresponding 64-bit element of the return value.

_mm512_mask_multishift_epi64_epi8

```
__m512i _mm512_mask_multishift_epi64_epi8(__m512i src, __mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512VBMI

Instruction(s): vpmultishiftqb

For each 64-bit element in *b*, select 8 unaligned bytes using a byte-granular shift control within the corresponding 64-bit element of *a*, and store the 8 assembled bytes to the corresponding 64-bit element of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_multishift_epi64_epi8

```
__m512i _mm512_maskz_multishift_epi64_epi8(__mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512VBMI

Instruction(s): vpmultishiftqb

For each 64-bit element in *b*, select 8 unaligned bytes using a byte-granular shift control within the corresponding 64-bit element of *a*, and store the 8 assembled bytes to the corresponding 64-bit element of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

Intrinsics for Comparison Operations

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `zmmintrin.h` header file.
To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

variable	definition
src	source element to use based on writemask result
k	writemask used as a selector
a	first source vector element
b	second source vector element
imm	comparison predicate, which can be any of the following values: • `_MM_CMPINT_EQ` - Equal • `_MM_CMPINT_LT` - Less than • `_MM_CMPINT_LE` - Less than or Equal • `_MM_CMPINT_NE` - Not Equal • `_MM_CMPINT_NLT` - Not Less than • `_MM_CMPINT_GE` - Greater than or Equal • `_MM_CMPINT_NLE` - Not Less than or Equal • `_MM_CMPINT_GT` - Greater than

_mm_conflict_epi32

```
__m128i _mm_conflict_epi32(__m128i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vpconflictd

Test each 32-bit element of *a* for equality with all other elements in *a* closer to the least significant element. Each element's comparison forms a zero extended bit vector in the return value.

_mm_mask_conflict_epi32

```
__m128i _mm_mask_conflict_epi32(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vpconflictd

Test each 32-bit element of *a* for equality with all other elements in *a* closer to the least significant element using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). Each element's comparison forms a zero extended bit vector in the return value.

_mm_maskz_conflict_epi32

```
__m128i _mm_maskz_conflict_epi32(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vpconflictd

Test each 32-bit element of *a* for equality with all other elements in *a* closer to the least significant element using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). Each element's comparison forms a zero extended bit vector in the return value.

_mm256_conflict_epi32

```
__m256i _mm256_conflict_epi32(__m256i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vpconflictd

Test each 32-bit element of *a* for equality with all other elements in *a* closer to the least significant element. Each element's comparison forms a zero extended bit vector in the return value.

_mm256_mask_conflict_epi32

```
__m256i _mm256_mask_conflict_epi32(__m256i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vpconflictd

Test each 32-bit element of *a* for equality with all other elements in *a* closer to the least significant element using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). Each element's comparison forms a zero extended bit vector in the return value.

_mm256_maskz_conflict_epi32

```
__m256i _mm256_maskz_conflict_epi32(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vpconflictd

Test each 32-bit element of *a* for equality with all other elements in *a* closer to the least significant element using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). Each element's comparison forms a zero extended bit vector in the return value.

_mm_conflict_epi64

```
__m128i _mm_conflict_epi64(__m128i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vpconflictq

Test each 64-bit element of *a* for equality with all other elements in *a* closer to the least significant element. Each element's comparison forms a zero extended bit vector in the return value.

_mm_mask_conflict_epi64

```
__m128i _mm_mask_conflict_epi64(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vpconflictq

Test each 64-bit element of *a* for equality with all other elements in *a* closer to the least significant element using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). Each element's comparison forms a zero extended bit vector in the return value.

_mm_maskz_conflict_epi64

```
__m128i _mm_maskz_conflict_epi64(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vpconflictq

Test each 64-bit element of *a* for equality with all other elements in *a* closer to the least significant element using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). Each element's comparison forms a zero extended bit vector in the return value.

_mm256_conflict_epi64

```
__m256i _mm256_conflict_epi64(__m256i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vpconflictq

Test each 64-bit element of *a* for equality with all other elements in *a* closer to the least significant element. Each element's comparison forms a zero extended bit vector in the return value.

_mm256_mask_conflict_epi64

```
__m256i _mm256_mask_conflict_epi64(__m256i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vpconflictq

Test each 64-bit element of *a* for equality with all other elements in *a* closer to the least significant element using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). Each element's comparison forms a zero extended bit vector in the return value.

_mm256_maskz_conflict_epi64

```
__m256i _mm256_maskz_conflict_epi64(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vpconflictq

Test each 64-bit element of *a* for equality with all other elements in *a* closer to the least significant element using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). Each element's comparison forms a zero extended bit vector in the return value.

_mm_cmp_pd_mask

```
__mmask8 _mm_cmp_pd_mask(__m128d a, __m128d b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcmppd

Compare packed double-precision (64-bit) floating-point elements in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm_mask_cmp_pd_mask

```
__mmask8 _mm_mask_cmp_pd_mask(__mmask8 k1, __m128d a, __m128d b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcmppd

Compare packed double-precision (64-bit) floating-point elements in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cmp_pd_mask

```
__mmask8 _mm256_cmp_pd_mask(__m256d a, __m256d b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcmppd

Compare packed double-precision (64-bit) floating-point elements in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm256_mask_cmp_pd_mask

```
__mmask8 _mm256_mask_cmp_pd_mask(__mmask8 k1, __m256d a, __m256d b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcmppd

Compare packed double-precision (64-bit) floating-point elements in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cmp_ps_mask

```
__mmask8 _mm_cmp_ps_mask(__m128 a, __m128 b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcmpps

Compare packed single-precision (32-bit) floating-point elements in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm_mask_cmp_ps_mask

```
__mmask8 _mm_mask_cmp_ps_mask(__mmask8 k1, __m128 a, __m128 b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcmpps

Compare packed single-precision (32-bit) floating-point elements in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cmp_ps_mask

```
__mmask8 _mm256_cmp_ps_mask(__m256 a, __m256 b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcmpps

Compare packed single-precision (32-bit) floating-point elements in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm256_mask_cmp_ps_mask

```
__mmask8 _mm256_mask_cmp_ps_mask(__mmask8 k1, __m256 a, __m256 b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcmpps

Compare packed single-precision (32-bit) floating-point elements in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cmp_epi8_mask

```
__mmask16 _mm_cmp_epi8_mask(__m128i a, __m128i b, const int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpeq_epi8_mask

```
__mmask16 _mm_cmpeq_epi8_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpge_epi8_mask

```
__mmask16 _mm_cmpge_epi8_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpgt_epi8_mask

```
__mmask16 _mm_cmpgt_epi8_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value.

_mm_cmple_epi8_mask

```
__mmask16 _mm_cmple_epi8_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_cmplt_epi8_mask

```
__mmask16 _mm_cmplt_epi8_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpneq_epi8_mask

```
__mmask16 _mm_cmpneq_epi8_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_mask_cmp_epi8_mask

```
__mmask16 _mm_mask_cmp_epi8_mask(__mmask16 k1, __m128i a, __m128i b, const int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpeq_epi8_mask

```
__mmask16 _mm_mask_cmpeq_epi8_mask(__mmask16 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpge_epi8_mask

```
__mmask16 _mm_mask_cmpge_epi8_mask(__mmask16 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpgt_epi8_mask

```
__mmask16 _mm_mask_cmpgt_epi8_mask(__mmask16 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmple_epi8_mask

```
__mmask16 _mm_mask_cmple_epi8_mask(__mmask16 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmplt_epi8_mask

```
__mmask16 _mm_mask_cmplt_epi8_mask(__mmask16 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpneq_epi8_mask

```
__mmask16 _mm_mask_cmpneq_epi8_mask(__mmask16 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cmp_epi8_mask

```
__mmask32 _mm256_cmp_epi8_mask(__m256i a, __m256i b, const int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpeq_epi8_mask

```
__mmask32 _mm256_cmpeq_epi8_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpge_epi8_mask

```
__mmask32 _mm256_cmpge_epi8_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpgt_epi8_mask

```
__mmask32 _mm256_cmpgt_epi8_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmple_epi8_mask

```
__mmask32 _mm256_cmple_epi8_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmplt_epi8_mask

```
__mmask32 _mm256_cmplt_epi8_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpneq_epi8_mask

```
__mmask32 _mm256_cmpneq_epi8_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_mask_cmp_epi8_mask

```
__mmask32 _mm256_mask_cmp_epi8_mask(__mmask32 k1, __m256i a, __m256i b, const int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpeq_epi8_mask

```
__mmask32 _mm256_mask_cmpeq_epi8_mask(__mmask32 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpge_epi8_mask

```
__mmask32 _mm256_mask_cmpge_epi8_mask(__mmask32 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpgt_epi8_mask

```
__mmask32 _mm256_mask_cmpgt_epi8_mask(__mmask32 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmple_epi8_mask

```
__mmask32 _mm256_mask_cmple_epi8_mask(__mmask32 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmplt_epi8_mask

```
__mmask32 _mm256_mask_cmplt_epi8_mask(__mmask32 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpneq_epi8_mask

```
__mmask32 _mm256_mask_cmpneq_epi8_mask(__mmask32 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_cmp_epi8_mask

```
__mmask64 _mm512_cmp_epi8_mask(__m512i a, __m512i b, const int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm512_cmpeq_epi8_mask

```
__mmask64 _mm512_cmpeq_epi8_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value.

_mm512_cmpge_epi8_mask

```
__mmask64 _mm512_cmpge_epi8_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm512_cmpgt_epi8_mask

```
__mmask64 _mm512_cmpgt_epi8_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value.

_mm512_cmple_epi8_mask

```
__mmask64 _mm512_cmple_epi8_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm512_cmplt_epi8_mask

```
__mmask64 _mm512_cmplt_epi8_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value.

_mm512_cmpneq_epi8_mask

```
__mmask64 _mm512_cmpneq_epi8_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value.

_mm512_mask_cmp_epi8_mask

```
__mmask64 _mm512_mask_cmp_epi8_mask(__mmask64 k1, __m512i a, __m512i b, const int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_cmpeq_epi8_mask

```
__mmask64 _mm512_mask_cmpeq_epi8_mask(__mmask64 k1, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_cmpge_epi8_mask

```
__mmask64 _mm512_mask_cmpge_epi8_mask(__mmask64 k1, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_cmpgt_epi8_mask

```
__mmask64 _mm512_mask_cmpgt_epi8_mask(__mmask64 k1, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_cmple_epi8_mask

```
__mmask64 _mm512_mask_cmple_epi8_mask(__mmask64 k1, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_cmplt_epi8_mask

```
__mmask64 _mm512_mask_cmplt_epi8_mask(__mmask64 k1, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_cmpneq_epi8_mask

```
__mmask64 _mm512_mask_cmpneq_epi8_mask(__mmask64 k1, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpb

Compare packed 8-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cmp_epi32_mask

```
__mmask8 _mm_cmp_epi32_mask(__m128i a, __m128i b, const _MM_CMPINT_ENUM imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpeq_epi32_mask

```
__mmask8 _mm_cmpeq_epi32_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpge_epi32_mask

```
__mmask8 _mm_cmpge_epi32_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpgt_epi32_mask

```
__mmask8 _mm_cmpgt_epi32_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value.

_mm_cmple_epi32_mask

```
__mmask8 _mm_cmple_epi32_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_cmplt_epi32_mask

```
__mmask8 _mm_cmplt_epi32_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpneq_epi32_mask

```
__mmask8 _mm_cmpneq_epi32_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_mask_cmp_epi32_mask

```
__mmask8 _mm_mask_cmp_epi32_mask(__mmask8 k1, __m128i a, __m128i b, const _MM_CMPINT_ENUM imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpeq_epi32_mask

```
__mmask8 _mm_mask_cmpeq_epi32_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpge_epi32_mask

```
__mmask8 _mm_mask_cmpge_epi32_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpgt_epi32_mask

```
__mmask8 _mm_mask_cmpgt_epi32_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmple_epi32_mask

```
__mmask8 _mm_mask_cmple_epi32_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmplt_epi32_mask

```
__mmask8 _mm_mask_cmplt_epi32_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpneq_epi32_mask

```
__mmask8 _mm_mask_cmpneq_epi32_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cmp_epi32_mask

```
__mmask8 _mm256_cmp_epi32_mask(__m256i a, __m256i b, const _MM_CMPINT_ENUM imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpeq_epi32_mask

```
__mmask8 _mm256_cmpeq_epi32_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpge_epi32_mask

```
__mmask8 _mm256_cmpge_epi32_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpgt_epi32_mask

```
__mmask8 _mm256_cmpgt_epi32_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmple_epi32_mask

```
__mmask8 _mm256_cmple_epi32_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmplt_epi32_mask

```
__mmask8 _mm256_cmplt_epi32_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpneq_epi32_mask

```
__mmask8 _mm256_cmpneq_epi32_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_mask_cmp_epi32_mask

```
__mmask8 _mm256_mask_cmp_epi32_mask(__mmask8 k1, __m256i a, __m256i b, const _MM_CMPINT_ENUM imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpeq_epi32_mask

```
__mmask8 _mm256_mask_cmpeq_epi32_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpge_epi32_mask

```
__mmask8 _mm256_mask_cmpge_epi32_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpgt_epi32_mask

```
__mmask8 _mm256_mask_cmpgt_epi32_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmple_epi32_mask

```
__mmask8 _mm256_mask_cmple_epi32_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmplt_epi32_mask

```
__mmask8 _mm256_mask_cmplt_epi32_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpneq_epi32_mask

```
__mmask8 _mm256_mask_cmpneq_epi32_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpd

Compare packed 32-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cmp_epi64_mask

```
__mmask8 _mm_cmp_epi64_mask(__m128i a, __m128i b, const _MM_CMPINT_ENUM imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpeq_epi64_mask

```
__mmask8 _mm_cmpeq_epi64_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpge_epi64_mask

```
__mmask8 _mm_cmpge_epi64_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpgt_epi64_mask

```
__mmask8 _mm_cmpgt_epi64_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value.

_mm_cmple_epi64_mask

```
__mmask8 _mm_cmple_epi64_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_cmplt_epi64_mask

```
__mmask8 _mm_cmplt_epi64_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpneq_epi64_mask

```
__mmask8 _mm_cmpneq_epi64_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_mask_cmp_epi64_mask

```
__mmask8 _mm_mask_cmp_epi64_mask(__mmask8 k1, __m128i a, __m128i b, const _MM_CMPINT_ENUM imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpeq_epi64_mask

```
__mmask8 _mm_mask_cmpeq_epi64_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpge_epi64_mask

```
__mmask8 _mm_mask_cmpge_epi64_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpgt_epi64_mask

```
__mmask8 _mm_mask_cmpgt_epi64_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmple_epi64_mask

```
__mmask8 _mm_mask_cmple_epi64_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmplt_epi64_mask

```
__mmask8 _mm_mask_cmplt_epi64_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpneq_epi64_mask

```
__mmask8 _mm_mask_cmpneq_epi64_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cmp_epi64_mask

```
__mmask8 _mm256_cmp_epi64_mask(__m256i a, __m256i b, const _MM_CMPINT_ENUM imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpeq_epi64_mask

```
__mmask8 _mm256_cmpeq_epi64_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpge_epi64_mask

```
__mmask8 _mm256_cmpge_epi64_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpgt_epi64_mask

```
__mmask8 _mm256_cmpgt_epi64_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmple_epi64_mask

```
__mmask8 _mm256_cmple_epi64_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmplt_epi64_mask

```
__mmask8 _mm256_cmplt_epi64_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpneq_epi64_mask

```
__mmask8 _mm256_cmpneq_epi64_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_mask_cmp_epi64_mask

```
__mmask8 _mm256_mask_cmp_epi64_mask(__mmask8 k1, __m256i a, __m256i b, const _MM_CMPINT_ENUM imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpeq_epi64_mask

```
__mmask8 _mm256_mask_cmpeq_epi64_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpge_epi64_mask

```
__mmask8 _mm256_mask_cmpge_epi64_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpgt_epi64_mask

```
__mmask8 _mm256_mask_cmpgt_epi64_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmple_epi64_mask

```
__mmask8 _mm256_mask_cmple_epi64_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmplt_epi64_mask

```
__mmask8 _mm256_mask_cmplt_epi64_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpneq_epi64_mask

```
__mmask8 _mm256_mask_cmpneq_epi64_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpq

Compare packed 64-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cmp_epu8_mask

```
__mmask16 _mm_cmp_epu8_mask(__m128i a, __m128i b, const int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpeq_epu8_mask

```
__mmask16 _mm_cmpeq_epu8_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpge_epu8_mask

```
__mmask16 _mm_cmpge_epu8_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpgt_epu8_mask

```
__mmask16 _mm_cmpgt_epu8_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value.

_mm_cmple_epu8_mask

```
__mmask16 _mm_cmple_epu8_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_cmplt_epu8_mask

```
__mmask16 _mm_cmplt_epu8_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpneq_epu8_mask

```
__mmask16 _mm_cmpneq_epu8_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_mask_cmp_epu8_mask

```
__mmask16 _mm_mask_cmp_epu8_mask(__mmask16 k1, __m128i a, __m128i b, const int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpeq_epu8_mask

```
__mmask16 _mm_mask_cmpeq_epu8_mask(__mmask16 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpge_epu8_mask

```
__mmask16 _mm_mask_cmpge_epu8_mask(__mmask16 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpgt_epu8_mask

```
__mmask16 _mm_mask_cmpgt_epu8_mask(__mmask16 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmple_epu8_mask

```
__mmask16 _mm_mask_cmple_epu8_mask(__mmask16 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmplt_epu8_mask

```
__mmask16 _mm_mask_cmplt_epu8_mask(__mmask16 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpneq_epu8_mask

```
__mmask16 _mm_mask_cmpneq_epu8_mask(__mmask16 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cmp_epu8_mask

```
__mmask32 _mm256_cmp_epu8_mask(__m256i a, __m256i b, const int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpeq_epu8_mask

```
__mmask32 _mm256_cmpeq_epu8_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpge_epu8_mask

```
__mmask32 _mm256_cmpge_epu8_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpgt_epu8_mask

```
__mmask32 _mm256_cmpgt_epu8_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmple_epu8_mask

```
__mmask32 _mm256_cmple_epu8_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmplt_epu8_mask

```
__mmask32 _mm256_cmplt_epu8_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpneq_epu8_mask

```
__mmask32 _mm256_cmpneq_epu8_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_mask_cmp_epu8_mask

```
__mmask32 _mm256_mask_cmp_epu8_mask(__mmask32 k1, __m256i a, __m256i b, const int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpeq_epu8_mask

CPUID Flags: AVX512BW

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value.

_mm512_mask_cmp_epu8_mask

```
__mmask64 _mm512_mask_cmp_epu8_mask(__mmask64 k1, __m512i a, __m512i b, const int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_cmpeq_epu8_mask

```
__mmask64 _mm512_mask_cmpeq_epu8_mask(__mmask64 k1, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_cmpge_epu8_mask

```
__mmask64 _mm512_mask_cmpge_epu8_mask(__mmask64 k1, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_cmpgt_epu8_mask

```
__mmask64 _mm512_mask_cmpgt_epu8_mask(__mmask64 k1, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_cmple_epu8_mask

```
__mmask64 _mm512_mask_cmple_epu8_mask(__mmask64 k1, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_cmplt_epu8_mask

```
__mmask64 _mm512_mask_cmplt_epu8_mask(__mmask64 k1, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_cmpneq_epu8_mask

```
__mmask64 _mm512_mask_cmpneq_epu8_mask(__mmask64 k1, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpub

Compare packed unsigned 8-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cmp_epu32_mask

```
__mmask8 _mm_cmp_epu32_mask(__m128i a, __m128i b, const _MM_CMPINT_ENUM imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpeq_epu32_mask

```
__mmask8 _mm_cmpeq_epu32_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpge_epu32_mask

```
__mmask8 _mm_cmpge_epu32_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpgt_epu32_mask

```
__mmask8 _mm_cmpgt_epu32_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value.

_mm_cmple_epu32_mask

```
__mmask8 _mm_cmple_epu32_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_cmplt_epu32_mask

```
__mmask8 _mm_cmplt_epu32_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpneq_epu32_mask

```
__mmask8 _mm_cmpneq_epu32_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_mask_cmp_epu32_mask

```
__mmask8 _mm_mask_cmp_epu32_mask(__mmask8 k1, __m128i a, __m128i b, const _MM_CMPINT_ENUM imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpeq_epu32_mask

```
__mmask8 _mm_mask_cmpeq_epu32_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpge_epu32_mask

```
__mmask8 _mm_mask_cmpge_epu32_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpgt_epu32_mask

```
__mmask8 _mm_mask_cmpgt_epu32_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmple_epu32_mask

```
__mmask8 _mm_mask_cmple_epu32_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmplt_epu32_mask

```
__mmask8 _mm_mask_cmplt_epu32_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpneq_epu32_mask

```
__mmask8 _mm_mask_cmpneq_epu32_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cmp_epu32_mask

```
__mmask8 _mm256_cmp_epu32_mask(__m256i a, __m256i b, const _MM_CMPINT_ENUM imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpeq_epu32_mask

```
__mmask8 _mm256_cmpeq_epu32_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpge_epu32_mask

```
__mmask8 _mm256_cmpge_epu32_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpgt_epu32_mask

```
__mmask8 _mm256_cmpgt_epu32_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmple_epu32_mask

```
__mmask8 _mm256_cmple_epu32_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmplt_epu32_mask

```
__mmask8 _mm256_cmplt_epu32_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpneq_epu32_mask

```
__mmask8 _mm256_cmpneq_epu32_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_mask_cmp_epu32_mask

```
__mmask8 _mm256_mask_cmp_epu32_mask(__mmask8 k1, __m256i a, __m256i b, const _MM_CMPINT_ENUM imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpeq_epu32_mask

```
__mmask8 _mm256_mask_cmpeq_epu32_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpge_epu32_mask

```
__mmask8 _mm256_mask_cmpge_epu32_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpgt_epu32_mask

```
__mmask8 _mm256_mask_cmpgt_epu32_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmple_epu32_mask

```
__mmask8 _mm256_mask_cmple_epu32_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmplt_epu32_mask

```
__mmask8 _mm256_mask_cmplt_epu32_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpneq_epu32_mask

```
__mmask8 _mm256_mask_cmpneq_epu32_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpud

Compare packed unsigned 32-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cmp_epu64_mask

```
__mmask8 _mm_cmp_epu64_mask(__m128i a, __m128i b, const _MM_CMPINT_ENUM imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpeq_epu64_mask

```
__mmask8 _mm_cmpeq_epu64_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpge_epu64_mask

```
__mmask8 _mm_cmpge_epu64_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpgt_epu64_mask

```
__mmask8 _mm_cmpgt_epu64_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value.

_mm_cmple_epu64_mask

```
__mmask8 _mm_cmple_epu64_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_cmplt_epu64_mask

```
__mmask8 _mm_cmplt_epu64_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpneq_epu64_mask

```
__mmask8 _mm_cmpneq_epu64_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_mask_cmp_epu64_mask

```
__mmask8 _mm_mask_cmp_epu64_mask(__mmask8 k1, __m128i a, __m128i b, const _MM_CMPINT_ENUM imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpeq_epu64_mask

```
__mmask8 _mm_mask_cmpeq_epu64_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpge_epu64_mask

```
__mmask8 _mm_mask_cmpge_epu64_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpgt_epu64_mask

```
__mmask8 _mm_mask_cmpgt_epu64_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmple_epu64_mask

```
__mmask8 _mm_mask_cmple_epu64_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmplt_epu64_mask

```
__mmask8 _mm_mask_cmplt_epu64_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpneq_epu64_mask

```
__mmask8 _mm_mask_cmpneq_epu64_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cmp_epu64_mask

```
__mmask8 _mm256_cmp_epu64_mask(__m256i a, __m256i b, const _MM_CMPINT_ENUM imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpeq_epu64_mask

```
__mmask8 _mm256_cmpeq_epu64_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpge_epu64_mask

```
__mmask8 _mm256_cmpge_epu64_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpgt_epu64_mask

```
__mmask8 _mm256_cmpgt_epu64_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmple_epu64_mask

```
__mmask8 _mm256_cmple_epu64_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmplt_epu64_mask

```
__mmask8 _mm256_cmplt_epu64_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpneq_epu64_mask

```
__mmask8 _mm256_cmpneq_epu64_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_mask_cmp_epu64_mask

```
__mmask8 _mm256_mask_cmp_epu64_mask(__mmask8 k1, __m256i a, __m256i b, const _MM_CMPINT_ENUM imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpeq_epu64_mask

```
__mmask8 _mm256_mask_cmpeq_epu64_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpge_epu64_mask

```
__mmask8 _mm256_mask_cmpge_epu64_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpgt_epu64_mask

```
__mmask8 _mm256_mask_cmpgt_epu64_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmple_epu64_mask

```
__mmask8 _mm256_mask_cmple_epu64_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmplt_epu64_mask

```
__mmask8 _mm256_mask_cmplt_epu64_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpneq_epu64_mask

```
__mmask8 _mm256_mask_cmpneq_epu64_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcmpuq

Compare packed unsigned 64-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cmp_epu16_mask

```
__mmask8 _mm_cmp_epu16_mask(__m128i a, __m128i b, const int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpeq_epu16_mask

```
__mmask8 _mm_cmpeq_epu16_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpge_epu16_mask

```
__mmask8 _mm_cmpge_epu16_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpgt_epu16_mask

```
__mmask8 _mm_cmpgt_epu16_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value.

_mm_cmple_epu16_mask

```
__mmask8 _mm_cmple_epu16_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_cmplt_epu16_mask

```
__mmask8 _mm_cmplt_epu16_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpneq_epu16_mask

```
__mmask8 _mm_cmpneq_epu16_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_mask_cmp_epu16_mask

```
__mmask8 _mm_mask_cmp_epu16_mask(__mmask8 k1, __m128i a, __m128i b, const int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpeq_epu16_mask

```
__mmask8 _mm_mask_cmpeq_epu16_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpge_epu16_mask

```
__mmask8 _mm_mask_cmpge_epu16_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpgt_epu16_mask

```
__mmask8 _mm_mask_cmpgt_epu16_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmple_epu16_mask

```
__mmask8 _mm_mask_cmple_epu16_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmplt_epu16_mask

```
__mmask8 _mm_mask_cmplt_epu16_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpneq_epu16_mask

```
__mmask8 _mm_mask_cmpneq_epu16_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cmp_epu16_mask

```
__mmask16 _mm256_cmp_epu16_mask(__m256i a, __m256i b, const int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpeq_epu16_mask

```
__mmask16 _mm256_cmpeq_epu16_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpge_epu16_mask

```
__mmask16 _mm256_cmpge_epu16_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpgt_epu16_mask

```
__mmask16 _mm256_cmpgt_epu16_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmple_epu16_mask

```
__mmask16 _mm256_cmple_epu16_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmplt_epu16_mask

```
__mmask16 _mm256_cmplt_epu16_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpneq_epu16_mask

```
__mmask16 _mm256_cmpneq_epu16_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_mask_cmp_epu16_mask

```
__mmask16 _mm256_mask_cmp_epu16_mask(__mmask16 k1, __m256i a, __m256i b, const int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpeq_epu16_mask

```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_cmp_epu16_mask

```
__mmask32 _mm512_cmp_epu16_mask(__m512i a, __m512i b, const int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm512_cmpeq_epu16_mask

```
__mmask32 _mm512_cmpeq_epu16_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value.

_mm512_cmpge_epu16_mask

```
__mmask32 _mm512_cmpge_epu16_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm512_cmpgt_epu16_mask

```
__mmask32 _mm512_cmpgt_epu16_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value.

_mm512_cmple_epu16_mask

```
__mmask32 _mm512_cmple_epu16_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm512_cmplt_epu16_mask

```
__mmask32 _mm512_cmplt_epu16_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value.

_mm512_cmpneq_epu16_mask

```
__mmask32 _mm512_cmpneq_epu16_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value.

_mm512_mask_cmp_epu16_mask

```
__mmask32 _mm512_mask_cmp_epu16_mask(__mmask32 k1, __m512i a, __m512i b, const int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_cmpeq_epu16_mask

```

CPUID Flags: AVX512BW

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_cmpneq_epu16_mask

```
__mmask32 _mm512_mask_cmpneq_epu16_mask(__mmask32 k1, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpuw

Compare packed unsigned 16-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cmp_epi16_mask

```
__mmask8 _mm_cmp_epi16_mask(__m128i a, __m128i b, const int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpeq_epi16_mask

```
__mmask8 _mm_cmpeq_epi16_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpge_epi16_mask

```
__mmask8 _mm_cmpge_epi16_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpgt_epi16_mask

```
__mmask8 _mm_cmpgt_epi16_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value.

_mm_cmple_epi16_mask

```
__mmask8 _mm_cmple_epi16_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_cmplt_epi16_mask

```
__mmask8 _mm_cmplt_epi16_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value.

_mm_cmpneq_epi16_mask

```
__mmask8 _mm_cmpneq_epi16_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value.

_mm_mask_cmp_epi16_mask

```
__mmask8 _mm_mask_cmp_epi16_mask(__mmask8 k1, __m128i a, __m128i b, const int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpeq_epi16_mask

```
__mmask8 _mm_mask_cmpeq_epi16_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpge_epi16_mask

```
__mmask8 _mm_mask_cmpge_epi16_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpgt_epi16_mask

```
__mmask8 _mm_mask_cmpgt_epi16_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmple_epi16_mask

```
__mmask8 _mm_mask_cmple_epi16_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmplt_epi16_mask

```
__mmask8 _mm_mask_cmplt_epi16_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cmpneq_epi16_mask

```
__mmask8 _mm_mask_cmpneq_epi16_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cmp_epi16_mask

```
__mmask16 _mm256_cmp_epi16_mask(__m256i a, __m256i b, const int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpeq_epi16_mask

```
__mmask16 _mm256_cmpeq_epi16_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpge_epi16_mask

```
__mmask16 _mm256_cmpge_epi16_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpgt_epi16_mask

```
__mmask16 _mm256_cmpgt_epi16_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmple_epi16_mask

```
__mmask16 _mm256_cmple_epi16_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmplt_epi16_mask

```
__mmask16 _mm256_cmplt_epi16_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value.

_mm256_cmpneq_epi16_mask

```
__mmask16 _mm256_cmpneq_epi16_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value.

_mm256_mask_cmp_epi16_mask

```
__mmask16 _mm256_mask_cmp_epi16_mask(__mmask16 k1, __m256i a, __m256i b, const int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpeq_epi16_mask

```
__mmask16 _mm256_mask_cmpeq_epi16_mask(__mmask16 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpge_epi16_mask

```
__mmask16 _mm256_mask_cmpge_epi16_mask(__mmask16 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpgt_epi16_mask

```
__mmask16 _mm256_mask_cmpgt_epi16_mask(__mmask16 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmple_epi16_mask

```
__mmask16 _mm256_mask_cmple_epi16_mask(__mmask16 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmplt_epi16_mask

```
__mmask16 _mm256_mask_cmplt_epi16_mask(__mmask16 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cmpneq_epi16_mask

__mmask16 _mm256_mask_cmpneq_epi16_mask(__mmask16 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_cmp_epi16_mask

```
__mmask32 _mm512_cmp_epi16_mask(__m512i a, __m512i b, const int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm512_cmpeq_epi16_mask

```
__mmask32 _mm512_cmpeq_epi16_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for equality, and and put each result in the corresponding bit of the returned mask value.

_mm512_cmpge_epi16_mask

```
__mmask32 _mm512_cmpge_epi16_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for greater-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm512_cmpgt_epi16_mask

```
__mmask32 _mm512_cmpgt_epi16_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for greater-than, and and put each result in the corresponding bit of the returned mask value.

_mm512_cmple_epi16_mask

```
__mmask32 _mm512_cmple_epi16_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value.

_mm512_cmplt_epi16_mask

```
__mmask32 _mm512_cmplt_epi16_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value.

_mm512_cmpneq_epi16_mask

```
__mmask32 _mm512_cmpneq_epi16_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value.

_mm512_mask_cmp_epi16_mask

```
__mmask32 _mm512_mask_cmp_epi16_mask(__mmask32 k1, __m512i a, __m512i b, const int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* based on the comparison operand specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_cmpeq_epi16_mask

```

CPUID Flags: AVX512BW

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for less-than-or-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_cmplt_epi16_mask

```
__mmask32 _mm512_mask_cmplt_epi16_mask(__mmask32 k1, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for less-than, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_cmpneq_epi16_mask

```
__mmask32 _mm512_mask_cmpneq_epi16_mask(__mmask32 k1, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpcmpw

Compare packed 16-bit integers in *a* and *b* for not-equal, and and put each result in the corresponding bit of the returned mask value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_test_epi8_mask

```
__mmask16 _mm_mask_test_epi8_mask(__mmask16 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vptestmb

Compute the bitwise AND of packed 8-bit integers in *a* and *b*, producing intermediate 8-bit values, and set the corresponding bit in the returned mask value (subject to writemask *k*) if the intermediate value is non-zero.

_mm_test_epi8_mask

```
__mmask16 _mm_test_epi8_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vptestmb

Compute the bitwise AND of packed 8-bit integers in *a* and *b*, producing intermediate 8-bit values, and set the corresponding bit in the returned mask value if the intermediate value is non-zero.

_mm256_mask_test_epi8_mask

```
__mmask32 _mm256_mask_test_epi8_mask(__mmask32 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vptestmb

Compute the bitwise AND of packed 8-bit integers in *a* and *b*, producing intermediate 8-bit values, and set the corresponding bit in the returned mask value (subject to writemask *k*) if the intermediate value is non-zero.

_mm256_test_epi8_mask

```
__mmask32 _mm256_test_epi8_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vptestmb

Compute the bitwise AND of packed 8-bit integers in *a* and *b*, producing intermediate 8-bit values, and set the corresponding bit in the returned mask value if the intermediate value is non-zero.

_mm512_mask_test_epi8_mask

```
__mmask64 _mm512_mask_test_epi8_mask(__mmask64 k1, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vptestmb

Compute the bitwise AND of packed 8-bit integers in *a* and *b*, producing intermediate 8-bit values, and set the corresponding bit in the returned mask value (subject to writemask *k*) if the intermediate value is non-zero.

_mm512_test_epi8_mask

```
__mmask64 _mm512_test_epi8_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vptestmb

Compute the bitwise AND of packed 8-bit integers in *a* and *b*, producing intermediate 8-bit values, and set the corresponding bit in the returned mask value if the intermediate value is non-zero.

_mm_mask_test_epi32_mask

```
__mmask8 _mm_mask_test_epi32_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vptestmd

Compute the bitwise AND of packed 32-bit integers in *a* and *b*, producing intermediate 32-bit values, and set the corresponding bit in the returned mask value (subject to writemask *k*) if the intermediate value is non-zero.

_mm_test_epi32_mask

```
__mmask8 _mm_test_epi32_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vptestmd

Compute the bitwise AND of packed 32-bit integers in *a* and *b*, producing intermediate 32-bit values, and set the corresponding bit in the returned mask value if the intermediate value is non-zero.

_mm256_mask_test_epi32_mask

```
__mmask8 _mm256_mask_test_epi32_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vptestmd

Compute the bitwise AND of packed 32-bit integers in *a* and *b*, producing intermediate 32-bit values, and set the corresponding bit in the returned mask value (subject to writemask *k*) if the intermediate value is non-zero.

_mm256_test_epi32_mask

```
__mmask8 _mm256_test_epi32_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vptestmd

Compute the bitwise AND of packed 32-bit integers in *a* and *b*, producing intermediate 32-bit values, and set the corresponding bit in the returned mask value if the intermediate value is non-zero.

_mm_mask_test_epi64_mask

```
__mmask8 _mm_mask_test_epi64_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vptestmq

Compute the bitwise AND of packed 64-bit integers in *a* and *b*, producing intermediate 64-bit values, and set the corresponding bit in the returned mask value (subject to writemask *k*) if the intermediate value is non-zero.

_mm_test_epi64_mask

```
__mmask8 _mm_test_epi64_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vptestmq

Compute the bitwise AND of packed 64-bit integers in *a* and *b*, producing intermediate 64-bit values, and set the corresponding bit in the returned mask value if the intermediate value is non-zero.

_mm256_mask_test_epi64_mask

```
__mmask8 _mm256_mask_test_epi64_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vptestmq

Compute the bitwise AND of packed 64-bit integers in *a* and *b*, producing intermediate 64-bit values, and set the corresponding bit in the returned mask value (subject to writemask *k*) if the intermediate value is non-zero.

_mm256_test_epi64_mask

```
__mmask8 _mm256_test_epi64_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vptestmq

Compute the bitwise AND of packed 64-bit integers in *a* and *b*, producing intermediate 64-bit values, and set the corresponding bit in the returned mask value if the intermediate value is non-zero.

_mm_mask_test_epi16_mask

```
__mmask8 _mm_mask_test_epi16_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vptestmw

Compute the bitwise AND of packed 16-bit integers in *a* and *b*, producing intermediate 16-bit values, and set the corresponding bit in the returned mask value (subject to writemask *k*) if the intermediate value is non-zero.

_mm_test_epi16_mask

```
__mmask8 _mm_test_epi16_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vptestmw

Compute the bitwise AND of packed 16-bit integers in *a* and *b*, producing intermediate 16-bit values, and set the corresponding bit in the returned mask value if the intermediate value is non-zero.

_mm256_mask_test_epi16_mask

```
__mmask16 _mm256_mask_test_epi16_mask(__mmask16 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vptestmw

Compute the bitwise AND of packed 16-bit integers in *a* and *b*, producing intermediate 16-bit values, and set the corresponding bit in the returned mask value (subject to writemask *k*) if the intermediate value is non-zero.

_mm256_test_epi16_mask

```
__mmask16 _mm256_test_epi16_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vptestmw

Compute the bitwise AND of packed 16-bit integers in *a* and *b*, producing intermediate 16-bit values, and set the corresponding bit in the returned mask value if the intermediate value is non-zero.

_mm512_mask_test_epi16_mask

```
__mmask32 _mm512_mask_test_epi16_mask(__mmask32 k1, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vptestmw

Compute the bitwise AND of packed 16-bit integers in *a* and *b*, producing intermediate 16-bit values, and set the corresponding bit in the returned mask value (subject to writemask *k*) if the intermediate value is non-zero.

_mm512_test_epi16_mask

```
__mmask32 _mm512_test_epi16_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vptestmw

Compute the bitwise AND of packed 16-bit integers in *a* and *b*, producing intermediate 16-bit values, and set the corresponding bit in the returned mask value if the intermediate value is non-zero.

_mm_mask_testn_epi8_mask

```
__mmask16 _mm_mask_testn_epi8_mask(__mmask16 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vptestnmb

Compute the bitwise AND of packed 8-bit integers in *a* and *b*, producing intermediate 8-bit values, and set the corresponding bit in the returned mask value (subject to writemask *k*) if the intermediate value is zero.

_mm_testn_epi8_mask

```
__mmask16 _mm_testn_epi8_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vptestnmb

Compute the bitwise AND of packed 8-bit integers in *a* and *b*, producing intermediate 8-bit values, and set the corresponding bit in the returned mask value if the intermediate value is zero.

_mm256_mask_testn_epi8_mask

```
__mmask32 _mm256_mask_testn_epi8_mask(__mmask32 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vptestnmb

Compute the bitwise AND of packed 8-bit integers in *a* and *b*, producing intermediate 8-bit values, and set the corresponding bit in the returned mask value (subject to writemask *k*) if the intermediate value is zero.

_mm256_testn_epi8_mask

```
__mmask32 _mm256_testn_epi8_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vptestnmb

Compute the bitwise AND of packed 8-bit integers in *a* and *b*, producing intermediate 8-bit values, and set the corresponding bit in the returned mask value if the intermediate value is zero.

_mm512_mask_testn_epi8_mask

```
__mmask64 _mm512_mask_testn_epi8_mask(__mmask64 k1, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vptestnmb

Compute the bitwise AND of packed 8-bit integers in *a* and *b*, producing intermediate 8-bit values, and set the corresponding bit in the returned mask value (subject to writemask *k*) if the intermediate value is zero.

_mm512_testn_epi8_mask

```
__mmask64 _mm512_testn_epi8_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vptestnmb

Compute the bitwise AND of packed 8-bit integers in *a* and *b*, producing intermediate 8-bit values, and set the corresponding bit in the returned mask value if the intermediate value is zero.

_mm_mask_testn_epi32_mask

```
__mmask8 _mm_mask_testn_epi32_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vptestnmd

Compute the bitwise AND of packed 32-bit integers in *a* and *b*, producing intermediate 32-bit values, and set the corresponding bit in the returned mask value (subject to writemask *k*) if the intermediate value is zero.

_mm_testn_epi32_mask

```
__mmask8 _mm_testn_epi32_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vptestnmd

Compute the bitwise AND of packed 32-bit integers in *a* and *b*, producing intermediate 32-bit values, and set the corresponding bit in the returned mask value if the intermediate value is zero.

_mm256_mask_testn_epi32_mask

```
__mmask8 _mm256_mask_testn_epi32_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vptestnmd

Compute the bitwise AND of packed 32-bit integers in *a* and *b*, producing intermediate 32-bit values, and set the corresponding bit in the returned mask value (subject to writemask *k*) if the intermediate value is zero.

_mm256_testn_epi32_mask

```
__mmask8 _mm256_testn_epi32_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vptestnmd

Compute the bitwise AND of packed 32-bit integers in *a* and *b*, producing intermediate 32-bit values, and set the corresponding bit in the returned mask value if the intermediate value is zero.

_mm_mask_testn_epi64_mask

```
__mmask8 _mm_mask_testn_epi64_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vptestnmq

Compute the bitwise AND of packed 64-bit integers in *a* and *b*, producing intermediate 64-bit values, and set the corresponding bit in the returned mask value (subject to writemask *k*) if the intermediate value is zero.

_mm_testn_epi64_mask

```
__mmask8 _mm_testn_epi64_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vptestnmq

Compute the bitwise AND of packed 64-bit integers in *a* and *b*, producing intermediate 64-bit values, and set the corresponding bit in the returned mask value if the intermediate value is zero.

_mm256_mask_testn_epi64_mask

```
__mmask8 _mm256_mask_testn_epi64_mask(__mmask8 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vptestnmq

Compute the bitwise AND of packed 64-bit integers in *a* and *b*, producing intermediate 64-bit values, and set the corresponding bit in the returned mask value (subject to writemask *k*) if the intermediate value is zero.

_mm256_testn_epi64_mask

```
__mmask8 _mm256_testn_epi64_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vptestnmq

Compute the bitwise AND of packed 64-bit integers in *a* and *b*, producing intermediate 64-bit values, and set the corresponding bit in the returned mask value if the intermediate value is zero.

_mm_mask_testn_epi16_mask

```
__mmask8 _mm_mask_testn_epi16_mask(__mmask8 k1, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vptestnmw

Compute the bitwise AND of packed 16-bit integers in *a* and *b*, producing intermediate 16-bit values, and set the corresponding bit in the returned mask value (subject to writemask *k*) if the intermediate value is zero.

_mm_testn_epi16_mask

```
__mmask8 _mm_testn_epi16_mask(__m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vptestnmw

Compute the bitwise AND of packed 16-bit integers in *a* and *b*, producing intermediate 16-bit values, and set the corresponding bit in the returned mask value if the intermediate value is zero.

_mm256_mask_testn_epi16_mask

```
__mmask16 _mm256_mask_testn_epi16_mask(__mmask16 k1, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vptestnmw

Compute the bitwise AND of packed 16-bit integers in *a* and *b*, producing intermediate 16-bit values, and set the corresponding bit in the returned mask value (subject to writemask *k*) if the intermediate value is zero.

_mm256_testn_epi16_mask

```
__mmask16 _mm256_testn_epi16_mask(__m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vptestnmw

Compute the bitwise AND of packed 16-bit integers in *a* and *b*, producing intermediate 16-bit values, and set the corresponding bit in the returned mask value if the intermediate value is zero.

_mm512_mask_testn_epi16_mask

```
__mmask32 _mm512_mask_testn_epi16_mask(__mmask32 k1, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vptestnmw

Compute the bitwise AND of packed 16-bit integers in *a* and *b*, producing intermediate 16-bit values, and set the corresponding bit in the returned mask value (subject to writemask *k*) if the intermediate value is zero.

_mm512_testn_epi16_mask

```
__mmask32 _mm512_testn_epi16_mask(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vptestnmw

Compute the bitwise AND of packed 16-bit integers in *a* and *b*, producing intermediate 16-bit values, and set the corresponding bit in the returned mask value if the intermediate value is zero.

Intrinsics for Conversion Operations

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `zmmintrin.h` header file.
To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

variable	definition
src	source element to use based on writemask result
k	writemask used as a selector
a	first source vector element
rounding	Rounding control values; these can be one of the following (along with the `sae` suppress all exceptions flag): • `_MM_FROUND_TO_NEAREST_INT` - rounds to nearest even • `_MM_FROUND_TO_NEG_INF` - rounds to negative infinity • `_MM_FROUND_TO_POS_INF` - rounds to positive infinity • `_MM_FROUND_TO_ZERO` - rounds to zero • `_MM_FROUND_CUR_DIRECTION` - rounds using default from MXCSR register

_mm_mask_cvtpd_ps

```
__m128 _mm_mask_cvtpd_ps(__m128 src, __mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtpd2ps

Convert packed double-precision (64-bit) floating-point elements in *a* to packed single-precision (32-bit) floating-point elements, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtpd_ps

```
__m128 _mm_maskz_cvtpd_ps(__mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtpd2ps

Convert packed double-precision (64-bit) floating-point elements in *a* to packed single-precision (32-bit) floating-point elements, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cvtpd_ps

```
__m128 _mm256_mask_cvtpd_ps(__m128 src, __mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtpd2ps

Convert packed double-precision (64-bit) floating-point elements in *a* to packed single-precision (32-bit) floating-point elements, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtpd_ps

```
__m128 _mm256_maskz_cvtpd_ps(__mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtpd2ps

Convert packed double-precision (64-bit) floating-point elements in *a* to packed single-precision (32-bit) floating-point elements, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cvtph_ps

```
__m128 _mm_mask_cvtph_ps(__m128 src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtph2ps

Convert packed half-precision (16-bit) floating-point elements in *a* to packed single-precision (32-bit) floating-point elements, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtph_ps

```
__m128 _mm_maskz_cvtph_ps(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtph2ps

Convert packed half-precision (16-bit) floating-point elements in *a* to packed single-precision (32-bit) floating-point elements, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cvtph_ps

```
__m256 _mm256_mask_cvtph_ps(__m256 src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtph2ps

Convert packed half-precision (16-bit) floating-point elements in *a* to packed single-precision (32-bit) floating-point elements, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtph_ps

```
__m256 _mm256_maskz_cvtph_ps(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtph2ps

Convert packed half-precision (16-bit) floating-point elements in *a* to packed single-precision (32-bit) floating-point elements, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cvt_roundps_ph

```
__m128i _mm_mask_cvt_roundps_ph(__m128i src, __mmask8 k, __m128 a, int rounding)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtps2ph

Convert packed single-precision (32-bit) floating-point elements in *a* to packed half-precision (16-bit) floating-point elements, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_mask_cvtps_ph

```
__m128i _mm_mask_cvtps_ph(__m128i src, __mmask8 k, __m128 a, int rounding)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtps2ph

Convert packed single-precision (32-bit) floating-point elements in *a* to packed half-precision (16-bit) floating-point elements, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvt_roundps_ph

```
__m128i _mm_maskz_cvt_roundps_ph(__mmask8 k, __m128 a, int rounding)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtps2ph

Convert packed single-precision (32-bit) floating-point elements in *a* to packed half-precision (16-bit) floating-point elements, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_maskz_cvtps_ph

```
__m128i _mm_maskz_cvtps_ph(__mmask8 k, __m128 a, int rounding)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtps2ph

Convert packed single-precision (32-bit) floating-point elements in *a* to packed half-precision (16-bit) floating-point elements, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cvt_roundps_ph

```
__m128i _mm256_mask_cvt_roundps_ph(__m128i src, __mmask8 k, __m256 a, int rounding)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtps2ph

Convert packed single-precision (32-bit) floating-point elements in *a* to packed half-precision (16-bit) floating-point elements, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_mask_cvtps_ph

```
__m128i _mm256_mask_cvtps_ph(__m128i src, __mmask8 k, __m256 a, int rounding)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtps2ph

Convert packed single-precision (32-bit) floating-point elements in *a* to packed half-precision (16-bit) floating-point elements, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvt_roundps_ph

```
__m128i _mm256_maskz_cvt_roundps_ph(__mmask8 k, __m256 a, int rounding)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtps2ph

Convert packed single-precision (32-bit) floating-point elements in *a* to packed half-precision (16-bit) floating-point elements, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_maskz_cvtps_ph

```
__m128i _mm256_maskz_cvtps_ph(__mmask8 k, __m256 a, int rounding)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtps2ph

Convert packed single-precision (32-bit) floating-point elements in *a* to packed half-precision (16-bit) floating-point elements, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cvtepi32_pd

```
__m128d _mm_mask_cvtepi32_pd(__m128d src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtdq2pd

Convert packed 32-bit integers in *a* to packed double-precision (64-bit) floating-point elements, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtepi32_pd

```
__m128d _mm_maskz_cvtepi32_pd(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtdq2pd

Convert packed 32-bit integers in *a* to packed double-precision (64-bit) floating-point elements, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cvtepi32_pd

```
__m256d _mm256_mask_cvtepi32_pd(__m256d src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtdq2pd

Convert packed 32-bit integers in *a* to packed double-precision (64-bit) floating-point elements, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtepi32_pd

```
__m256d _mm256_maskz_cvtepi32_pd(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtdq2pd

Convert packed 32-bit integers in *a* to packed double-precision (64-bit) floating-point elements, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cvtepi32_ps

```
__m128 _mm_mask_cvtepi32_ps(__m128 src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtdq2ps

Convert packed 32-bit integers in *a* to packed single-precision (32-bit) floating-point elements, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtepi32_ps

```
__m128 _mm_maskz_cvtepi32_ps(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtdq2ps

Convert packed 32-bit integers in *a* to packed single-precision (32-bit) floating-point elements, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cvtepi32_ps

```
__m256 _mm256_mask_cvtepi32_ps(__m256 src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtdq2ps

Convert packed 32-bit integers in *a* to packed single-precision (32-bit) floating-point elements, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtepi32_ps

```
__m256 _mm256_maskz_cvtepi32_ps(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtdq2ps

Convert packed 32-bit integers in *a* to packed single-precision (32-bit) floating-point elements, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cvtpd_epi32

```
__m128i _mm_mask_cvtpd_epi32(__m128i src, __mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtpd2dq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 32-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtpd_epi32

```
__m128i _mm_maskz_cvtpd_epi32(__mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtpd2dq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 32-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cvtpd_epi32

```
__m128i _mm256_mask_cvtpd_epi32(__m128i src, __mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtpd2dq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 32-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtpd_epi32

```
__m128i _mm256_maskz_cvtpd_epi32(__mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtpd2dq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 32-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvtpd_epi64

```
__m128i _mm_cvtpd_epi64(__m128d a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtpd2qq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 64-bit integers, and return the results.

_mm_mask_cvtpd_epi64

```
__m128i _mm_mask_cvtpd_epi64(__m128i src, __mmask8 k, __m128d a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtpd2qq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 64-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtpd_epi64

```
__m128i _mm_maskz_cvtpd_epi64(__mmask8 k, __m128d a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtpd2qq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 64-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvtpd_epi64

```
__m256i _mm256_cvtpd_epi64(__m256d a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtpd2qq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 64-bit integers, and return the results.

_mm256_mask_cvtpd_epi64

```
__m256i _mm256_mask_cvtpd_epi64(__m256i src, __mmask8 k, __m256d a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtpd2qq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 64-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtpd_epi64

```
__m256i _mm256_maskz_cvtpd_epi64(__mmask8 k, __m256d a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtpd2qq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 64-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_cvt_roundpd_epi64

```
__m512i _mm512_cvt_roundpd_epi64(__m512d a, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtpd2qq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 64-bit integers, and return the results.

_mm512_cvtpd_epi64

```
__m512i _mm512_cvtpd_epi64(__m512d a)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtpd2qq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 64-bit integers, and return the results.

_mm512_mask_cvt_roundpd_epi64

```
__m512i _mm512_mask_cvt_roundpd_epi64(__m512i src, __mmask8 k, __m512d a, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtpd2qq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 64-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_mask_cvtpd_epi64

```
__m512i _mm512_mask_cvtpd_epi64(__m512i src, __mmask8 k, __m512d a)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtpd2qq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 64-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_cvt_roundpd_epi64

```
__m512i _mm512_maskz_cvt_roundpd_epi64(__mmask8 k, __m512d a, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtpd2qq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 64-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_maskz_cvtpd_epi64

```
__m512i _mm512_maskz_cvtpd_epi64(__mmask8 k, __m512d a)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtpd2qq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 64-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvtpd_epu32

```
__m128i _mm_cvtpd_epu32(__m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtpd2udq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed unsigned 32-bit integers, and return the results.

_mm_mask_cvtpd_epu32

```
__m128i _mm_mask_cvtpd_epu32(__m128i src, __mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtpd2udq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed unsigned 32-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtpd_epu32

```
__m128i _mm_maskz_cvtpd_epu32(__mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtpd2udq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed unsigned 32-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvtpd_epu32

```
__m128i _mm256_cvtpd_epu32(__m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtpd2udq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed unsigned 32-bit integers, and return the results.

_mm256_mask_cvtpd_epu32

```
__m128i _mm256_mask_cvtpd_epu32(__m128i src, __mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtpd2udq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed unsigned 32-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtpd_epu32

```
__m128i _mm256_maskz_cvtpd_epu32(__mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtpd2udq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed unsigned 32-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvtpd_epu64

```
__m128i _mm_cvtpd_epu64(__m128d a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtpd2uqq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed unsigned 64-bit integers, and return the results.

_mm_mask_cvtpd_epu64

```
__m128i _mm_mask_cvtpd_epu64(__m128i src, __mmask8 k, __m128d a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtpd2uqq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed unsigned 64-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtpd_epu64

```
__m128i _mm_maskz_cvtpd_epu64(__mmask8 k, __m128d a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtpd2uqq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed unsigned 64-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvtpd_epu64

```
__m256i _mm256_cvtpd_epu64(__m256d a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtpd2uqq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed unsigned 64-bit integers, and return the results.

_mm256_mask_cvtpd_epu64

```
__m256i _mm256_mask_cvtpd_epu64(__m256i src, __mmask8 k, __m256d a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtpd2uqq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed unsigned 64-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtpd_epu64

```
__m256i _mm256_maskz_cvtpd_epu64(__mmask8 k, __m256d a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtpd2uqq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed unsigned 64-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_cvt_roundpd_epu64

```
__m512i _mm512_cvt_roundpd_epu64(__m512d a, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtpd2uqq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed unsigned 64-bit integers, and return the results.

_mm512_cvtpd_epu64

```
__m512i _mm512_cvtpd_epu64(__m512d a)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtpd2uqq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed unsigned 64-bit integers, and return the results.

_mm512_mask_cvt_roundpd_epu64

```
__m512i _mm512_mask_cvt_roundpd_epu64(__m512i src, __mmask8 k, __m512d a, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtpd2uqq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed unsigned 64-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_mask_cvtpd_epu64

```
__m512i _mm512_mask_cvtpd_epu64(__m512i src, __mmask8 k, __m512d a)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtpd2uqq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed unsigned 64-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_cvt_roundpd_epu64

```
__m512i _mm512_maskz_cvt_roundpd_epu64(__mmask8 k, __m512d a, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtpd2uqq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed unsigned 64-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_maskz_cvtpd_epu64

```
__m512i _mm512_maskz_cvtpd_epu64(__mmask8 k, __m512d a)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtpd2uqq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed unsigned 64-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cvtps_epi32

```

__m256i _mm256_mask_cvtps_epi32(__m256i src, __mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtps2dq

Convert packed single-precision (32-bit) floating-point elements in *a* to packed 32-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtps_epi32

```
__m256i _mm256_maskz_cvtps_epi32(__mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvtps2dq

Convert packed single-precision (32-bit) floating-point elements in *a* to packed 32-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvtps_epi64

```
__m128i _mm_cvtps_epi64(__m128 a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtps2qq

Convert packed single-precision (32-bit) floating-point elements in *a* to packed 64-bit integers, and return the results.

_mm_mask_cvtps_epi64

```
__m128i _mm_mask_cvtps_epi64(__m128i src, __mmask8 k, __m128 a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtps2qq

Convert packed single-precision (32-bit) floating-point elements in *a* to packed 64-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtps_epi64

```
__m128i _mm_maskz_cvtps_epi64(__mmask8 k, __m128 a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtps2qq

Convert packed single-precision (32-bit) floating-point elements in *a* to packed 64-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvtps_epi64

```
__m256i _mm256_cvtps_epi64(__m128 a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtps2qq

Convert packed single-precision (32-bit) floating-point elements in *a* to packed 64-bit integers, and return the results.

_mm256_mask_cvtps_epi64

```
__m256i _mm256_mask_cvtps_epi64(__m256i src, __mmask8 k, __m128 a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtps2qq

Convert packed single-precision (32-bit) floating-point elements in *a* to packed 64-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtps_epi64

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtqq2pd

Convert packed 64-bit integers in *a* to packed double-precision (64-bit) floating-point elements, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_cvt_roundepi64_pd

```
__m512d _mm512_cvt_roundepi64_pd(__m512i a, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtqq2pd

Convert packed 64-bit integers in *a* to packed double-precision (64-bit) floating-point elements, and return the results.

_mm512_cvtepi64_pd

```
__m512d _mm512_cvtepi64_pd(__m512i a)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtqq2pd

Convert packed 64-bit integers in *a* to packed double-precision (64-bit) floating-point elements, and return the results.

_mm512_mask_cvt_roundepi64_pd

```
__m512d _mm512_mask_cvt_roundepi64_pd(__m512d src, __mmask8 k, __m512i a, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtqq2pd

Convert packed 64-bit integers in *a* to packed double-precision (64-bit) floating-point elements, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_mask_cvtepi64_pd

```
__m512d _mm512_mask_cvtepi64_pd(__m512d src, __mmask8 k, __m512i a)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtqq2pd

Convert packed 64-bit integers in *a* to packed double-precision (64-bit) floating-point elements, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_cvt_roundepi64_pd

```
__m512d _mm512_maskz_cvt_roundepi64_pd(__mmask8 k, __m512i a, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtqq2pd

Convert packed 64-bit integers in *a* to packed double-precision (64-bit) floating-point elements, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_maskz_cvtepi64_pd

```
__m512d _mm512_maskz_cvtepi64_pd(__mmask8 k, __m512i a)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtqq2pd

Convert packed 64-bit integers in *a* to packed double-precision (64-bit) floating-point elements, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvtepi64_ps

```
__m128 _mm_cvtepi64_ps(__m128i a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtqq2ps

Convert packed 64-bit integers in *a* to packed single-precision (32-bit) floating-point elements, and return the results.

_mm_mask_cvtepi64_ps

```
__m128 _mm_mask_cvtepi64_ps(__m128 src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtqq2ps

Convert packed 64-bit integers in *a* to packed single-precision (32-bit) floating-point elements, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtepi64_ps

```
__m128 _mm_maskz_cvtepi64_ps(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtqq2ps

Convert packed 64-bit integers in *a* to packed single-precision (32-bit) floating-point elements, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvtepi64_ps

```
__m128 _mm256_cvtepi64_ps(__m256i a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtqq2ps

Convert packed 64-bit integers in *a* to packed single-precision (32-bit) floating-point elements, and return the results.

_mm256_mask_cvtepi64_ps

```
__m128 _mm256_mask_cvtepi64_ps(__m128 src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtqq2ps

Convert packed 64-bit integers in *a* to packed single-precision (32-bit) floating-point elements, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtepi64_ps

```
__m128 _mm256_maskz_cvtepi64_ps(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvtqq2ps

Convert packed 64-bit integers in *a* to packed single-precision (32-bit) floating-point elements, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_cvt_roundepi64_ps

```
__m256 _mm512_cvt_roundepi64_ps(__m512i a, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtqq2ps

Convert packed 64-bit integers in *a* to packed single-precision (32-bit) floating-point elements, and return the results.

_mm512_cvtepi64_ps

```
__m256 _mm512_cvtepi64_ps(__m512i a)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtqq2ps

Convert packed 64-bit integers in *a* to packed single-precision (32-bit) floating-point elements, and return the results.

_mm512_mask_cvt_roundepi64_ps

```
__m256 _mm512_mask_cvt_roundepi64_ps(__m256 src, __mmask8 k, __m512i a, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtqq2ps

Convert packed 64-bit integers in *a* to packed single-precision (32-bit) floating-point elements, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_mask_cvtepi64_ps

```
__m256 _mm512_mask_cvtepi64_ps(__m256 src, __mmask8 k, __m512i a)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtqq2ps

Convert packed 64-bit integers in *a* to packed single-precision (32-bit) floating-point elements, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_cvt_roundepi64_ps

```
__m256 _mm512_maskz_cvt_roundepi64_ps(__mmask8 k, __m512i a, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtqq2ps

Convert packed 64-bit integers in *a* to packed single-precision (32-bit) floating-point elements, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_maskz_cvtepi64_ps

```
__m256 _mm512_maskz_cvtepi64_ps(__mmask8 k, __m512i a)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvtqq2ps

Convert packed 64-bit integers in *a* to packed single-precision (32-bit) floating-point elements, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cvttpd_epi32

```
__m128i _mm_mask_cvttpd_epi32(__m128i src, __mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvttpd2dq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 32-bit integers with truncation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvttpd_epi32

```
__m128i _mm_maskz_cvttpd_epi32(__mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvttpd2dq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 32-bit integers with truncation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cvttpd_epi32

```
__m128i _mm256_mask_cvttpd_epi32(__m128i src, __mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvttpd2dq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 32-bit integers with truncation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvttpd_epi32

```
__m128i _mm256_maskz_cvttpd_epi32(__mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvttpd2dq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 32-bit integers with truncation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvttpd_epi64

```
__m128i _mm_cvttpd_epi64(__m128d a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvttpd2qq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 64-bit integers with truncation, and return the results.

_mm_mask_cvttpd_epi64

```
__m128i _mm_mask_cvttpd_epi64(__m128i src, __mmask8 k, __m128d a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvttpd2qq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 64-bit integers with truncation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvttpd_epi64

```
__m128i _mm_maskz_cvttpd_epi64(__mmask8 k, __m128d a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvttpd2qq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 64-bit integers with truncation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvttpd_epi64

```
__m256i _mm256_cvttpd_epi64(__m256d a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvttpd2qq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 64-bit integers with truncation, and return the results.

_mm256_mask_cvttpd_epi64

```
__m256i _mm256_mask_cvttpd_epi64(__m256i src, __mmask8 k, __m256d a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvttpd2qq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 64-bit integers with truncation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvttpd_epi64

```
__m256i _mm256_maskz_cvttpd_epi64(__mmask8 k, __m256d a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvttpd2qq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 64-bit integers with truncation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_cvtt_roundpd_epi64

```
__m512i _mm512_cvtt_roundpd_epi64(__m512d a, int sae)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvttpd2qq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 64-bit integers with truncation, and return the results. Pass __MM_FROUND_NO_EXC to *sae* to suppress all exceptions.

_mm512_cvttpd_epi64

```
__m512i _mm512_cvttpd_epi64(__m512d a)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvttpd2qq

Convert packed double-precision (64-bit) floating-point elements in *a* to packed 64-bit integers with truncation, and return the results.

_mm512_mask_cvtt_roundpd_epi64

```
__m512i _mm512_mask_cvtt_roundpd_epi64(__m512i src, __mmask8 k, __m512d a, int sae)

```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcvttps2dq

Convert packed single-precision (32-bit) floating-point elements in *a* to packed 32-bit integers with truncation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvttps_epi64

```
__m128i _mm_cvttps_epi64(__m128 a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvttps2qq

Convert packed single-precision (32-bit) floating-point elements in *a* to packed 64-bit integers with truncation, and return the results.

_mm_mask_cvttps_epi64

```
__m128i _mm_mask_cvttps_epi64(__m128i src, __mmask8 k, __m128 a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvttps2qq

Convert packed single-precision (32-bit) floating-point elements in *a* to packed 64-bit integers with truncation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvttps_epi64

```
__m128i _mm_maskz_cvttps_epi64(__mmask8 k, __m128 a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvttps2qq

Convert packed single-precision (32-bit) floating-point elements in *a* to packed 64-bit integers with truncation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvttps_epi64

```
__m256i _mm256_cvttps_epi64(__m128 a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvttps2qq

Convert packed single-precision (32-bit) floating-point elements in *a* to packed 64-bit integers with truncation, and return the results.

_mm256_mask_cvttps_epi64

```
__m256i _mm256_mask_cvttps_epi64(__m256i src, __mmask8 k, __m128 a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvttps2qq

Convert packed single-precision (32-bit) floating-point elements in *a* to packed 64-bit integers with truncation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvttps_epi64

```
__m256i _mm256_maskz_cvttps_epi64(__mmask8 k, __m128 a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vcvttps2qq

Convert packed single-precision (32-bit) floating-point elements in *a* to packed 64-bit integers with truncation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_cvtt_roundps_epi64

```
__m512i _mm512_cvtt_roundps_epi64(__m256 a, int sae)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvttps2qq

Convert packed single-precision (32-bit) floating-point elements in *a* to packed 64-bit integers with truncation, and return the results. Pass __MM_FROUND_NO_EXC to *sae* to suppress all exceptions.

_mm512_cvttps_epi64

```
__m512i _mm512_cvttps_epi64(__m256 a)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvttps2qq

Convert packed single-precision (32-bit) floating-point elements in *a* to packed 64-bit integers with truncation, and return the results.

_mm512_mask_cvtt_roundps_epi64

```
__m512i _mm512_mask_cvtt_roundps_epi64(__m512i src, __mmask8 k, __m256 a, int sae)
```

CPUID Flags: AVX512DQ

Instruction(s): vcvttps2qq

Convert packed single-precision (32-bit) floating-point elements in *a* to packed 64-bit integers with truncation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_mask_cvttps_epi64

```

```

CPUID Flags: AVX512DQ

Instruction(s): vcvtuqq2ps

Convert packed unsigned 64-bit integers in *a* to packed single-precision (32-bit) floating-point elements, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvtepi32_epi8

```
__m128i _mm_cvtepi32_epi8(__m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovdb

Convert packed 32-bit integers in *a* to packed 8-bit integers with truncation, and return the results.

_mm_mask_cvtepi32_epi8

```
__m128i _mm_mask_cvtepi32_epi8(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovdb

Convert packed 32-bit integers in *a* to packed 8-bit integers with truncation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtepi32_epi8

```
__m128i _mm_maskz_cvtepi32_epi8(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovdb

Convert packed 32-bit integers in *a* to packed 8-bit integers with truncation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvtepi32_epi8

```
__m128i _mm256_cvtepi32_epi8(__m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovdb

Convert packed 32-bit integers in *a* to packed 8-bit integers with truncation, and return the results.

_mm256_mask_cvtepi32_epi8

```
__m128i _mm256_mask_cvtepi32_epi8(__m128i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovdb

Convert packed 32-bit integers in *a* to packed 8-bit integers with truncation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtepi32_epi8

```
__m128i _mm256_maskz_cvtepi32_epi8(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovdb

Convert packed 32-bit integers in *a* to packed 8-bit integers with truncation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvtepi32_epi16

```
__m128i _mm_cvtepi32_epi16(__m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovdw

Convert packed 32-bit integers in *a* to packed 16-bit integers with truncation, and return the results.

_mm_mask_cvtepi32_epi16

```
__m128i _mm_mask_cvtepi32_epi16(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovdw

Convert packed 32-bit integers in *a* to packed 16-bit integers with truncation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtepi32_epi16

```
__m128i _mm_maskz_cvtepi32_epi16(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovdw

Convert packed 32-bit integers in *a* to packed 16-bit integers with truncation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvtepi32_epi16

```
__m128i _mm256_cvtepi32_epi16(__m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovdw

Convert packed 32-bit integers in *a* to packed 16-bit integers with truncation, and return the results.

_mm256_mask_cvtepi32_epi16

```
__m128i _mm256_mask_cvtepi32_epi16(__m128i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovdw

Convert packed 32-bit integers in *a* to packed 16-bit integers with truncation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtepi32_epi16

```
__m128i _mm256_maskz_cvtepi32_epi16(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovdw

Convert packed 32-bit integers in *a* to packed 16-bit integers with truncation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvtepi64_epi8

```
__m128i _mm_cvtepi64_epi8(__m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqb

Convert packed 64-bit integers in *a* to packed 8-bit integers with truncation, and return the results.

_mm_mask_cvtepi64_epi8

```
__m128i _mm_mask_cvtepi64_epi8(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqb

Convert packed 64-bit integers in *a* to packed 8-bit integers with truncation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtepi64_epi8

```
__m128i _mm_maskz_cvtepi64_epi8(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqb

Convert packed 64-bit integers in *a* to packed 8-bit integers with truncation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvtepi64_epi8

```
__m128i _mm256_cvtepi64_epi8(__m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqb

Convert packed 64-bit integers in *a* to packed 8-bit integers with truncation, and return the results.

_mm256_mask_cvtepi64_epi8

```
__m128i _mm256_mask_cvtepi64_epi8(__m128i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqb

Convert packed 64-bit integers in *a* to packed 8-bit integers with truncation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtepi64_epi8

```
__m128i _mm256_maskz_cvtepi64_epi8(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqb

Convert packed 64-bit integers in *a* to packed 8-bit integers with truncation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvtepi64_epi32

```
__m128i _mm_cvtepi64_epi32(__m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqd

Convert packed 64-bit integers in *a* to packed 32-bit integers with truncation, and return the results.

_mm_mask_cvtepi64_epi32

```
__m128i _mm_mask_cvtepi64_epi32(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqd

Convert packed 64-bit integers in *a* to packed 32-bit integers with truncation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtepi64_epi32

```
__m128i _mm_maskz_cvtepi64_epi32(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqd

Convert packed 64-bit integers in *a* to packed 32-bit integers with truncation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvtepi64_epi32

```
__m128i _mm256_cvtepi64_epi32(__m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqd

Convert packed 64-bit integers in *a* to packed 32-bit integers with truncation, and return the results.

_mm256_mask_cvtepi64_epi32

```
__m128i _mm256_mask_cvtepi64_epi32(__m128i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqd

Convert packed 64-bit integers in *a* to packed 32-bit integers with truncation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtepi64_epi32

```
__m128i _mm256_maskz_cvtepi64_epi32(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqd

Convert packed 64-bit integers in *a* to packed 32-bit integers with truncation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvtepi64_epi16

```
__m128i _mm_cvtepi64_epi16(__m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqw

Convert packed 64-bit integers in *a* to packed 16-bit integers with truncation, and return the results.

_mm_mask_cvtepi64_epi16

```
__m128i _mm_mask_cvtepi64_epi16(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqw

Convert packed 64-bit integers in *a* to packed 16-bit integers with truncation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtepi64_epi16

```
__m128i _mm_maskz_cvtepi64_epi16(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqw

Convert packed 64-bit integers in *a* to packed 16-bit integers with truncation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvtepi64_epi16

```
__m128i _mm256_cvtepi64_epi16(__m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqw

Convert packed 64-bit integers in *a* to packed 16-bit integers with truncation, and return the results.

_mm256_mask_cvtepi64_epi16

```
__m128i _mm256_mask_cvtepi64_epi16(__m128i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqw

Convert packed 64-bit integers in *a* to packed 16-bit integers with truncation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtepi64_epi16

```
__m128i _mm256_maskz_cvtepi64_epi16(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqw

Convert packed 64-bit integers in *a* to packed 16-bit integers with truncation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvtsepi32_epi8

```
__m128i _mm_cvtsepi32_epi8(__m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsdb

Convert packed 32-bit integers in *a* to packed 8-bit integers with signed saturation, and return the results.

_mm_mask_cvtsepi32_epi8

```
__m128i _mm_mask_cvtsepi32_epi8(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsdb

Convert packed 32-bit integers in *a* to packed 8-bit integers with signed saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtsepi32_epi8

```
__m128i _mm_maskz_cvtsepi32_epi8(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsdb

Convert packed 32-bit integers in *a* to packed 8-bit integers with signed saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvtsepi32_epi8

```
__m128i _mm256_cvtsepi32_epi8(__m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsdb

Convert packed 32-bit integers in *a* to packed 8-bit integers with signed saturation, and return the results.

_mm256_mask_cvtsepi32_epi8

```
__m128i _mm256_mask_cvtsepi32_epi8(__m128i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsdb

Convert packed 32-bit integers in *a* to packed 8-bit integers with signed saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtsepi32_epi8

```
__m128i _mm256_maskz_cvtsepi32_epi8(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsdb

Convert packed 32-bit integers in *a* to packed 8-bit integers with signed saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvtsepi32_epi16

```
__m128i _mm_cvtsepi32_epi16(__m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsdw

Convert packed 32-bit integers in *a* to packed 16-bit integers with signed saturation, and return the results.

_mm_mask_cvtsepi32_epi16

```
__m128i _mm_mask_cvtsepi32_epi16(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsdw

Convert packed 32-bit integers in *a* to packed 16-bit integers with signed saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtsepi32_epi16

```
__m128i _mm_maskz_cvtsepi32_epi16(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsdw

Convert packed 32-bit integers in *a* to packed 16-bit integers with signed saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvtsepi32_epi16

```
__m128i _mm256_cvtsepi32_epi16(__m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsdw

Convert packed 32-bit integers in *a* to packed 16-bit integers with signed saturation, and return the results.

_mm256_mask_cvtsepi32_epi16

```
__m128i _mm256_mask_cvtsepi32_epi16(__m128i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsdw

Convert packed 32-bit integers in *a* to packed 16-bit integers with signed saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtsepi32_epi16

```
__m128i _mm256_maskz_cvtsepi32_epi16(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsdw

Convert packed 32-bit integers in *a* to packed 16-bit integers with signed saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvtsepi64_epi8

```
__m128i _mm_cvtsepi64_epi8(__m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqb

Convert packed 64-bit integers in *a* to packed 8-bit integers with signed saturation, and return the results.

_mm_mask_cvtsepi64_epi8

```
__m128i _mm_mask_cvtsepi64_epi8(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqb

Convert packed 64-bit integers in *a* to packed 8-bit integers with signed saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtsepi64_epi8

```
__m128i _mm_maskz_cvtsepi64_epi8(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqb

Convert packed 64-bit integers in *a* to packed 8-bit integers with signed saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvtsepi64_epi8

```
__m128i _mm256_cvtsepi64_epi8(__m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqb

Convert packed 64-bit integers in *a* to packed 8-bit integers with signed saturation, and return the results.

_mm256_mask_cvtsepi64_epi8

```
__m128i _mm256_mask_cvtsepi64_epi8(__m128i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqb

Convert packed 64-bit integers in *a* to packed 8-bit integers with signed saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtsepi64_epi8

```
__m128i _mm256_maskz_cvtsepi64_epi8(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqb

Convert packed 64-bit integers in *a* to packed 8-bit integers with signed saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvtsepi64_epi32

```
__m128i _mm_cvtsepi64_epi32(__m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqd

Convert packed 64-bit integers in *a* to packed 32-bit integers with signed saturation, and return the results.

_mm_mask_cvtsepi64_epi32

```
__m128i _mm_mask_cvtsepi64_epi32(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqd

Convert packed 64-bit integers in *a* to packed 32-bit integers with signed saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtsepi64_epi32

```
__m128i _mm_maskz_cvtsepi64_epi32(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqd

Convert packed 64-bit integers in *a* to packed 32-bit integers with signed saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvtsepi64_epi32

```
__m128i _mm256_cvtsepi64_epi32(__m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqd

Convert packed 64-bit integers in *a* to packed 32-bit integers with signed saturation, and return the results.

_mm256_mask_cvtsepi64_epi32

```
__m128i _mm256_mask_cvtsepi64_epi32(__m128i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqd

Convert packed 64-bit integers in *a* to packed 32-bit integers with signed saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtsepi64_epi32

```
__m128i _mm256_maskz_cvtsepi64_epi32(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqd

Convert packed 64-bit integers in *a* to packed 32-bit integers with signed saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvtsepi64_epi16

```
__m128i _mm_cvtsepi64_epi16(__m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqw

Convert packed 64-bit integers in *a* to packed 16-bit integers with signed saturation, and return the results.

_mm_mask_cvtsepi64_epi16

```
__m128i _mm_mask_cvtsepi64_epi16(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqw

Convert packed 64-bit integers in *a* to packed 16-bit integers with signed saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtsepi64_epi16

```
__m128i _mm_maskz_cvtsepi64_epi16(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqw

Convert packed 64-bit integers in *a* to packed 16-bit integers with signed saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvtsepi64_epi16

```
__m128i _mm256_cvtsepi64_epi16(__m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqw

Convert packed 64-bit integers in *a* to packed 16-bit integers with signed saturation, and return the results.

_mm256_mask_cvtsepi64_epi16

```
__m128i _mm256_mask_cvtsepi64_epi16(__m128i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqw

Convert packed 64-bit integers in *a* to packed 16-bit integers with signed saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtsepi64_epi16

```
__m128i _mm256_maskz_cvtsepi64_epi16(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqw

Convert packed 64-bit integers in *a* to packed 16-bit integers with signed saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvtsepi16_epi8

```
__m128i _mm_cvtsepi16_epi8(__m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovswb

Convert packed 16-bit integers in *a* to packed 8-bit integers with signed saturation, and return the results.

_mm_mask_cvtsepi16_epi8

```
__m128i _mm_mask_cvtsepi16_epi8(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovswb

Convert packed 16-bit integers in *a* to packed 8-bit integers with signed saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtsepi16_epi8

```
__m128i _mm_maskz_cvtsepi16_epi8(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovswb

Convert packed 16-bit integers in *a* to packed 8-bit integers with signed saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvtsepi16_epi8

```
__m128i _mm256_cvtsepi16_epi8(__m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovswb

Convert packed 16-bit integers in *a* to packed 8-bit integers with signed saturation, and return the results.

_mm256_mask_cvtsepi16_epi8

```
__m128i _mm256_mask_cvtsepi16_epi8(__m128i src, __mmask16 k, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovswb

Convert packed 16-bit integers in *a* to packed 8-bit integers with signed saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtsepi16_epi8

```
__m128i _mm256_maskz_cvtsepi16_epi8(__mmask16 k, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovswb

Convert packed 16-bit integers in *a* to packed 8-bit integers with signed saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_cvtsepi16_epi8

```
__m256i _mm512_cvtsepi16_epi8(__m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpmovswb

Convert packed 16-bit integers in *a* to packed 8-bit integers with signed saturation, and return the results.

_mm512_mask_cvtsepi16_epi8

```
__m256i _mm512_mask_cvtsepi16_epi8(__m256i src, __mmask32 k, __m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpmovswb

Convert packed 16-bit integers in *a* to packed 8-bit integers with signed saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_cvtsepi16_epi8

```
__m256i _mm512_maskz_cvtsepi16_epi8(__mmask32 k, __m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpmovswb

Convert packed 16-bit integers in *a* to packed 8-bit integers with signed saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cvtepi8_epi32

```
__m128i _mm_mask_cvtepi8_epi32(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsxbd

Sign extend packed 8-bit integers in the low 4 bytes of *a* to packed 32-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtepi8_epi32

```
__m128i _mm_maskz_cvtepi8_epi32(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsxbd

Sign extend packed 8-bit integers in the low 4 bytes of *a* to packed 32-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cvtepi8_epi32

```
__m256i _mm256_mask_cvtepi8_epi32(__m256i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsxbd

Sign extend packed 8-bit integers in the low 8 bytes of *a* to packed 32-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtepi8_epi32

```
__m256i _mm256_maskz_cvtepi8_epi32(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsxbd

Sign extend packed 8-bit integers in the low 8 bytes of *a* to packed 32-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cvtepi8_epi64

```
__m128i _mm_mask_cvtepi8_epi64(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsxbq

Sign extend packed 8-bit integers in the low 2 bytes of *a* to packed 64-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtepi8_epi64

```
__m128i _mm_maskz_cvtepi8_epi64(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsxbq

Sign extend packed 8-bit integers in the low 2 bytes of *a* to packed 64-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cvtepi8_epi64

```
__m256i _mm256_mask_cvtepi8_epi64(__m256i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsxbq

Sign extend packed 8-bit integers in the low 4 bytes of *a* to packed 64-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtepi8_epi64

```
__m256i _mm256_maskz_cvtepi8_epi64(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsxbq

Sign extend packed 8-bit integers in the low 4 bytes of *a* to packed 64-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cvtepi8_epi16

```
__m128i _mm_mask_cvtepi8_epi16(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovsxbw

Sign extend packed 8-bit integers in *a* to packed 16-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtepi8_epi16

```
__m128i _mm_maskz_cvtepi8_epi16(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovsxbw

Sign extend packed 8-bit integers in *a* to packed 16-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cvtepi8_epi16

```
__m256i _mm256_mask_cvtepi8_epi16(__m256i src, __mmask16 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovsxbw

Sign extend packed 8-bit integers in *a* to packed 16-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtepi8_epi16

```
__m256i _mm256_maskz_cvtepi8_epi16(__mmask16 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovsxbw

Sign extend packed 8-bit integers in *a* to packed 16-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_cvtepi8_epi16

```
__m512i _mm512_cvtepi8_epi16(__m256i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpmovsxbw

Sign extend packed 8-bit integers in *a* to packed 16-bit integers, and return the results.

_mm512_mask_cvtepi8_epi16

```
__m512i _mm512_mask_cvtepi8_epi16(__m512i src, __mmask32 k, __m256i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpmovsxbw

Sign extend packed 8-bit integers in *a* to packed 16-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_cvtepi8_epi16

```
__m512i _mm512_maskz_cvtepi8_epi16(__mmask32 k, __m256i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpmovsxbw

Sign extend packed 8-bit integers in *a* to packed 16-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cvtepi32_epi64

```
__m128i _mm_mask_cvtepi32_epi64(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsxdq

Sign extend packed 32-bit integers in *a* to packed 64-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtepi32_epi64

```
__m128i _mm_maskz_cvtepi32_epi64(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsxdq

Sign extend packed 32-bit integers in *a* to packed 64-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cvtepi32_epi64

```
__m256i _mm256_mask_cvtepi32_epi64(__m256i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsxdq

Sign extend packed 32-bit integers in *a* to packed 64-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtepi32_epi64

```
__m256i _mm256_maskz_cvtepi32_epi64(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsxdq

Sign extend packed 32-bit integers in *a* to packed 64-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cvtepi16_epi32

```
__m128i _mm_mask_cvtepi16_epi32(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsxwd

Sign extend packed 16-bit integers in *a* to packed 32-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtepi16_epi32

```
__m128i _mm_maskz_cvtepi16_epi32(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsxwd

Sign extend packed 16-bit integers in *a* to packed 32-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cvtepi16_epi32

```
__m256i _mm256_mask_cvtepi16_epi32(__m256i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsxwd

Sign extend packed 16-bit integers in *a* to packed 32-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtepi16_epi32

```
__m256i _mm256_maskz_cvtepi16_epi32(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsxwd

Sign extend packed 16-bit integers in *a* to packed 32-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cvtepi16_epi64

```
__m128i _mm_mask_cvtepi16_epi64(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsxwq

Sign extend packed 16-bit integers in the low 4 bytes of *a* to packed 64-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtepi16_epi64

```
__m128i _mm_maskz_cvtepi16_epi64(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsxwq

Sign extend packed 16-bit integers in the low 4 bytes of *a* to packed 64-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cvtepi16_epi64

```
__m256i _mm256_mask_cvtepi16_epi64(__m256i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsxwq

Sign extend packed 16-bit integers in the low 8 bytes of *a* to packed 64-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtepi16_epi64

```
__m256i _mm256_maskz_cvtepi16_epi64(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsxwq

Sign extend packed 16-bit integers in the low 8 bytes of *a* to packed 64-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvtusepi32_epi8

```
__m128i _mm_cvtusepi32_epi8(__m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusdb

Convert packed unsigned 32-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and return the results.

_mm_mask_cvtusepi32_epi8

```
__m128i _mm_mask_cvtusepi32_epi8(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusdb

Convert packed unsigned 32-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtusepi32_epi8

```
__m128i _mm_maskz_cvtusepi32_epi8(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusdb

Convert packed unsigned 32-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvtusepi32_epi8

```
__m128i _mm256_cvtusepi32_epi8(__m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusdb

Convert packed unsigned 32-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and return the results.

_mm256_mask_cvtusepi32_epi8

```
__m128i _mm256_mask_cvtusepi32_epi8(__m128i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusdb

Convert packed unsigned 32-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtusepi32_epi8

```
__m128i _mm256_maskz_cvtusepi32_epi8(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusdb

Convert packed unsigned 32-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvtusepi32_epi16

```
__m128i _mm_cvtusepi32_epi16(__m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusdw

Convert packed unsigned 32-bit integers in *a* to packed unsigned 16-bit integers with unsigned saturation, and return the results.

_mm_mask_cvtusepi32_epi16

```
__m128i _mm_mask_cvtusepi32_epi16(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusdw

Convert packed unsigned 32-bit integers in *a* to packed unsigned 16-bit integers with unsigned saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtusepi32_epi16

```
__m128i _mm_maskz_cvtusepi32_epi16(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusdw

Convert packed unsigned 32-bit integers in *a* to packed unsigned 16-bit integers with unsigned saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvtusepi32_epi16

```
__m128i _mm256_cvtusepi32_epi16(__m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusdw

Convert packed unsigned 32-bit integers in *a* to packed unsigned 16-bit integers with unsigned saturation, and return the results.

_mm256_mask_cvtusepi32_epi16

```
__m128i _mm256_mask_cvtusepi32_epi16(__m128i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusdw

Convert packed unsigned 32-bit integers in *a* to packed unsigned 16-bit integers with unsigned saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtusepi32_epi16

```
__m128i _mm256_maskz_cvtusepi32_epi16(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusdw

Convert packed unsigned 32-bit integers in *a* to packed unsigned 16-bit integers with unsigned saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvtusepi64_epi8

```
__m128i _mm_cvtusepi64_epi8(__m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqb

Convert packed unsigned 64-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and return the results.

_mm_mask_cvtusepi64_epi8

```
__m128i _mm_mask_cvtusepi64_epi8(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqb

Convert packed unsigned 64-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtusepi64_epi8

```
__m128i _mm_maskz_cvtusepi64_epi8(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqb

Convert packed unsigned 64-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvtusepi64_epi8

```
__m128i _mm256_cvtusepi64_epi8(__m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqb

Convert packed unsigned 64-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and return the results.

_mm256_mask_cvtusepi64_epi8

```
__m128i _mm256_mask_cvtusepi64_epi8(__m128i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqb

Convert packed unsigned 64-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtusepi64_epi8

```
__m128i _mm256_maskz_cvtusepi64_epi8(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqb

Convert packed unsigned 64-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvtusepi64_epi32

```
__m128i _mm_cvtusepi64_epi32(__m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqd

Convert packed unsigned 64-bit integers in *a* to packed unsigned 32-bit integers with unsigned saturation, and return the results.

_mm_mask_cvtusepi64_epi32

```
__m128i _mm_mask_cvtusepi64_epi32(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqd

Convert packed unsigned 64-bit integers in *a* to packed unsigned 32-bit integers with unsigned saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtusepi64_epi32

```
__m128i _mm_maskz_cvtusepi64_epi32(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqd

Convert packed unsigned 64-bit integers in *a* to packed unsigned 32-bit integers with unsigned saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvtusepi64_epi32

```
__m128i _mm256_cvtusepi64_epi32(__m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqd

Convert packed unsigned 64-bit integers in *a* to packed unsigned 32-bit integers with unsigned saturation, and return the results.

_mm256_mask_cvtusepi64_epi32

```
__m128i _mm256_mask_cvtusepi64_epi32(__m128i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqd

Convert packed unsigned 64-bit integers in *a* to packed unsigned 32-bit integers with unsigned saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtusepi64_epi32

```
__m128i _mm256_maskz_cvtusepi64_epi32(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqd

Convert packed unsigned 64-bit integers in *a* to packed unsigned 32-bit integers with unsigned saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvtusepi64_epi16

```
__m128i _mm_cvtusepi64_epi16(__m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqw

Convert packed unsigned 64-bit integers in *a* to packed unsigned 16-bit integers with unsigned saturation, and return the results.

_mm_mask_cvtusepi64_epi16

```
__m128i _mm_mask_cvtusepi64_epi16(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqw

Convert packed unsigned 64-bit integers in *a* to packed unsigned 16-bit integers with unsigned saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtusepi64_epi16

```
__m128i _mm_maskz_cvtusepi64_epi16(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqw

Convert packed unsigned 64-bit integers in *a* to packed unsigned 16-bit integers with unsigned saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvtusepi64_epi16

```
__m128i _mm256_cvtusepi64_epi16(__m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqw

Convert packed unsigned 64-bit integers in *a* to packed unsigned 16-bit integers with unsigned saturation, and return the results.

_mm256_mask_cvtusepi64_epi16

```
__m128i _mm256_mask_cvtusepi64_epi16(__m128i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqw

Convert packed unsigned 64-bit integers in *a* to packed unsigned 16-bit integers with unsigned saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtusepi64_epi16

```
__m128i _mm256_maskz_cvtusepi64_epi16(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqw

Convert packed unsigned 64-bit integers in *a* to packed unsigned 16-bit integers with unsigned saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvtusepi16_epi8

```
__m128i _mm_cvtusepi16_epi8(__m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovuswb

Convert packed unsigned 16-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and return the results.

_mm_mask_cvtusepi16_epi8

```
__m128i _mm_mask_cvtusepi16_epi8(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovuswb

Convert packed unsigned 16-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtusepi16_epi8

```
__m128i _mm_maskz_cvtusepi16_epi8(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovuswb

Convert packed unsigned 16-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvtusepi16_epi8

```
__m128i _mm256_cvtusepi16_epi8(__m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovuswb

Convert packed unsigned 16-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and return the results.

_mm256_mask_cvtusepi16_epi8

```
__m128i _mm256_mask_cvtusepi16_epi8(__m128i src, __mmask16 k, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovuswb

Convert packed unsigned 16-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtusepi16_epi8

```
__m128i _mm256_maskz_cvtusepi16_epi8(__mmask16 k, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovuswb

Convert packed unsigned 16-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_cvtusepi16_epi8

```
__m256i _mm512_cvtusepi16_epi8(__m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpmovuswb

Convert packed unsigned 16-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and return the results.

_mm512_mask_cvtusepi16_epi8

```
__m256i _mm512_mask_cvtusepi16_epi8(__m256i src, __mmask32 k, __m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpmovuswb

Convert packed unsigned 16-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_cvtusepi16_epi8

```
__m256i _mm512_maskz_cvtusepi16_epi8(__mmask32 k, __m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpmovuswb

Convert packed unsigned 16-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_cvtepi16_epi8

```
__m128i _mm_cvtepi16_epi8(__m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovwb

Convert packed 16-bit integers in *a* to packed 8-bit integers with truncation, and return the results.

_mm_mask_cvtepi16_epi8

```
__m128i _mm_mask_cvtepi16_epi8(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovwb

Convert packed 16-bit integers in *a* to packed 8-bit integers with truncation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtepi16_epi8

```
__m128i _mm_maskz_cvtepi16_epi8(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovwb

Convert packed 16-bit integers in *a* to packed 8-bit integers with truncation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_cvtepi16_epi8

```
__m128i _mm256_cvtepi16_epi8(__m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovwb

Convert packed 16-bit integers in *a* to packed 8-bit integers with truncation, and return the results.

_mm256_mask_cvtepi16_epi8

```
__m128i _mm256_mask_cvtepi16_epi8(__m128i src, __mmask16 k, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovwb

Convert packed 16-bit integers in *a* to packed 8-bit integers with truncation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtepi16_epi8

```
__m128i _mm256_maskz_cvtepi16_epi8(__mmask16 k, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovwb

Convert packed 16-bit integers in *a* to packed 8-bit integers with truncation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_cvtepi16_epi8

```
__m256i _mm512_cvtepi16_epi8(__m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpmovwb

Convert packed 16-bit integers in *a* to packed 8-bit integers with truncation, and return the results.

_mm512_mask_cvtepi16_epi8

```
__m256i _mm512_mask_cvtepi16_epi8(__m256i src, __mmask32 k, __m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpmovwb

Convert packed 16-bit integers in *a* to packed 8-bit integers with truncation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_cvtepi16_epi8

```
__m256i _mm512_maskz_cvtepi16_epi8(__mmask32 k, __m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpmovwb

Convert packed 16-bit integers in *a* to packed 8-bit integers with truncation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cvtepu8_epi32

```
__m128i _mm_mask_cvtepu8_epi32(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovzxbd

Zero extend packed unsigned 8-bit integers in the low 4 bytes of *a* to packed 32-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtepu8_epi32

```
__m128i _mm_maskz_cvtepu8_epi32(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovzxbd

Zero extend packed unsigned 8-bit integers in th elow 4 bytes of *a* to packed 32-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cvtepu8_epi32

```
__m256i _mm256_mask_cvtepu8_epi32(__m256i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovzxbd

Zero extend packed unsigned 8-bit integers in the low 8 bytes of *a* to packed 32-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtepu8_epi32

```
__m256i _mm256_maskz_cvtepu8_epi32(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovzxbd

Zero extend packed unsigned 8-bit integers in the low 8 bytes of *a* to packed 32-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cvtepu8_epi64

```
__m128i _mm_mask_cvtepu8_epi64(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovzxbq

Zero extend packed unsigned 8-bit integers in the low 2 bytes of *a* to packed 64-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtepu8_epi64

```
__m128i _mm_maskz_cvtepu8_epi64(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovzxbq

Zero extend packed unsigned 8-bit integers in the low 2 bytes of *a* to packed 64-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cvtepu8_epi64

```
__m256i _mm256_mask_cvtepu8_epi64(__m256i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovzxbq

Zero extend packed unsigned 8-bit integers in the low 4 bytes of *a* to packed 64-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtepu8_epi64

```
__m256i _mm256_maskz_cvtepu8_epi64(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovzxbq

Zero extend packed unsigned 8-bit integers in the low 4 bytes of *a* to packed 64-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cvtepu8_epi16

```
__m128i _mm_mask_cvtepu8_epi16(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovzxbw

Zero extend packed unsigned 8-bit integers in *a* to packed 16-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtepu8_epi16

```
__m128i _mm_maskz_cvtepu8_epi16(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovzxbw

Zero extend packed unsigned 8-bit integers in *a* to packed 16-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cvtepu8_epi16

```
__m256i _mm256_mask_cvtepu8_epi16(__m256i src, __mmask16 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovzxbw

Zero extend packed unsigned 8-bit integers in *a* to packed 16-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtepu8_epi16

```
__m256i _mm256_maskz_cvtepu8_epi16(__mmask16 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovzxbw

Zero extend packed unsigned 8-bit integers in *a* to packed 16-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_cvtepu8_epi16

```
__m512i _mm512_cvtepu8_epi16(__m256i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpmovzxbw

Zero extend packed unsigned 8-bit integers in *a* to packed 16-bit integers, and return the results.

_mm512_mask_cvtepu8_epi16

```
__m512i _mm512_mask_cvtepu8_epi16(__m512i src, __mmask32 k, __m256i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpmovzxbw

Zero extend packed unsigned 8-bit integers in *a* to packed 16-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_cvtepu8_epi16

```
__m512i _mm512_maskz_cvtepu8_epi16(__mmask32 k, __m256i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpmovzxbw

Zero extend packed unsigned 8-bit integers in *a* to packed 16-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cvtepu32_epi64

```
__m128i _mm_mask_cvtepu32_epi64(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovzxdq

Zero extend packed unsigned 32-bit integers in *a* to packed 64-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtepu32_epi64

```
__m128i _mm_maskz_cvtepu32_epi64(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovzxdq

Zero extend packed unsigned 32-bit integers in *a* to packed 64-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cvtepu32_epi64

```
__m256i _mm256_mask_cvtepu32_epi64(__m256i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovzxdq

Zero extend packed unsigned 32-bit integers in *a* to packed 64-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtepu32_epi64

```
__m256i _mm256_maskz_cvtepu32_epi64(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovzxdq

Zero extend packed unsigned 32-bit integers in *a* to packed 64-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cvtepu16_epi32

```
__m128i _mm_mask_cvtepu16_epi32(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovzxwd

Zero extend packed unsigned 16-bit integers in *a* to packed 32-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtepu16_epi32

```
__m128i _mm_maskz_cvtepu16_epi32(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovzxwd

Zero extend packed unsigned 16-bit integers in *a* to packed 32-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cvtepu16_epi32

```
__m256i _mm256_mask_cvtepu16_epi32(__m256i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovzxwd

Zero extend packed unsigned 16-bit integers in *a* to packed 32-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtepu16_epi32

```
__m256i _mm256_maskz_cvtepu16_epi32(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovzxwd

Zero extend packed unsigned 16-bit integers in *a* to packed 32-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_cvtepu16_epi64

```
__m128i _mm_mask_cvtepu16_epi64(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovzxwq

Zero extend packed unsigned 16-bit integers in the low 4 bytes of *a* to packed 64-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_cvtepu16_epi64

```
__m128i _mm_maskz_cvtepu16_epi64(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovzxwq

Zero extend packed unsigned 16-bit integers in the low 4 bytes of *a* to packed 64-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_cvtepu16_epi64

```
__m256i _mm256_mask_cvtepu16_epi64(__m256i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovzxwq

Zero extend packed unsigned 16-bit integers in the low 8 bytes of *a* to packed 64-bit integers, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_cvtepu16_epi64

```
__m256i _mm256_maskz_cvtepu16_epi64(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovzxwq

Zero extend packed unsigned 16-bit integers in the low 8 bytes of *a* to packed 64-bit integers, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_packs_epi32

```
__m128i _mm_mask_packs_epi32(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpackssdw

Convert packed 32-bit integers from *a* and *b* to packed 16-bit integers using signed saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_packs_epi32

```
__m128i _mm_maskz_packs_epi32(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpackssdw

Convert packed 32-bit integers from *a* and *b* to packed 16-bit integers using signed saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_packs_epi32

```
__m256i _mm256_mask_packs_epi32(__m256i src, __mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpackssdw

Convert packed 32-bit integers from *a* and *b* to packed 16-bit integers using signed saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_packs_epi32

```
__m256i _mm256_maskz_packs_epi32(__mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpackssdw

Convert packed 32-bit integers from *a* and *b* to packed 16-bit integers using signed saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_packs_epi32

```
__m512i _mm512_mask_packs_epi32(__m512i src, __mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpackssdw

Convert packed 32-bit integers from *a* and *b* to packed 16-bit integers using signed saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_packs_epi32

```
__m512i _mm512_maskz_packs_epi32(__mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpackssdw

Convert packed 32-bit integers from *a* and *b* to packed 16-bit integers using signed saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_packs_epi32

```
__m512i _mm512_packs_epi32(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpackssdw

Convert packed 32-bit integers from *a* and *b* to packed 16-bit integers using signed saturation, and return the results.

_mm_mask_packs_epi16

```
__m128i _mm_mask_packs_epi16(__m128i src, __mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpacksswb

Convert packed 16-bit integers from *a* and *b* to packed 8-bit integers using signed saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_packs_epi16

```
__m128i _mm_maskz_packs_epi16(__mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpacksswb

Convert packed 16-bit integers from *a* and *b* to packed 8-bit integers using signed saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_packs_epi16

```
__m256i _mm256_mask_packs_epi16(__m256i src, __mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpacksswb

Convert packed 16-bit integers from *a* and *b* to packed 8-bit integers using signed saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_packs_epi16

```
__m256i _mm256_maskz_packs_epi16(__mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpacksswb

Convert packed 16-bit integers from *a* and *b* to packed 8-bit integers using signed saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_packs_epi16

```
__m512i _mm512_mask_packs_epi16(__m512i src, __mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpacksswb

Convert packed 16-bit integers from *a* and *b* to packed 8-bit integers using signed saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_packs_epi16

```
__m512i _mm512_maskz_packs_epi16(__mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpacksswb

Convert packed 16-bit integers from *a* and *b* to packed 8-bit integers using signed saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_packs_epi16

```
__m512i _mm512_packs_epi16(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpacksswb

Convert packed 16-bit integers from *a* and *b* to packed 8-bit integers using signed saturation, and return the results.

_mm_mask_packus_epi32

```
__m128i _mm_mask_packus_epi32(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpackusdw

Convert packed 32-bit integers from *a* and *b* to packed 16-bit integers using unsigned saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_packus_epi32

```
__m128i _mm_maskz_packus_epi32(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpackusdw

Convert packed 32-bit integers from *a* and *b* to packed 16-bit integers using unsigned saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_packus_epi32

```
__m256i _mm256_mask_packus_epi32(__m256i src, __mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpackusdw

Convert packed 32-bit integers from *a* and *b* to packed 16-bit integers using unsigned saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_packus_epi32

```
__m256i _mm256_maskz_packus_epi32(__mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpackusdw

Convert packed 32-bit integers from *a* and *b* to packed 16-bit integers using unsigned saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_packus_epi32

```
__m512i _mm512_mask_packus_epi32(__m512i src, __mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpackusdw

Convert packed 32-bit integers from *a* and *b* to packed 16-bit integers using unsigned saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_packus_epi32

```
__m512i _mm512_maskz_packus_epi32(__mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpackusdw

Convert packed 32-bit integers from *a* and *b* to packed 16-bit integers using unsigned saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_packus_epi32

```
__m512i _mm512_packus_epi32(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpackusdw

Convert packed 32-bit integers from *a* and *b* to packed 16-bit integers using unsigned saturation, and return the results.

_mm_mask_packus_epi16

```
__m128i _mm_mask_packus_epi16(__m128i src, __mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpackuswb

Convert packed 16-bit integers from *a* and *b* to packed 8-bit integers using unsigned saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_packus_epi16

```
__m128i _mm_maskz_packus_epi16(__mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpackuswb

Convert packed 16-bit integers from *a* and *b* to packed 8-bit integers using unsigned saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_packus_epi16

```
__m256i _mm256_mask_packus_epi16(__m256i src, __mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpackuswb

Convert packed 16-bit integers from *a* and *b* to packed 8-bit integers using unsigned saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_packus_epi16

```
__m256i _mm256_maskz_packus_epi16(__mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpackuswb

Convert packed 16-bit integers from *a* and *b* to packed 8-bit integers using unsigned saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_packus_epi16

```
__m512i _mm512_mask_packus_epi16(__m512i src, __mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpackuswb

Convert packed 16-bit integers from *a* and *b* to packed 8-bit integers using unsigned saturation, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_packus_epi16

```
__m512i _mm512_maskz_packus_epi16(__mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpackuswb

Convert packed 16-bit integers from *a* and *b* to packed 8-bit integers using unsigned saturation, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_packus_epi16

```
__m512i _mm512_packus_epi16(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpackuswb

Convert packed 16-bit integers from *a* and *b* to packed 8-bit integers using unsigned saturation, and return the results.

_mm_mask_cvtepi32_storeu_epi8

```
void _mm_mask_cvtepi32_storeu_epi8(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovdb

Convert packed 32-bit integers in *a* to packed 8-bit integers with truncation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm256_mask_cvtepi32_storeu_epi8

```
void _mm256_mask_cvtepi32_storeu_epi8(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovdb

Convert packed 32-bit integers in *a* to packed 8-bit integers with truncation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm_mask_cvtepi32_storeu_epi16

```
void _mm_mask_cvtepi32_storeu_epi16(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovdw

Convert packed 32-bit integers in *a* to packed 16-bit integers with truncation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm256_mask_cvtepi32_storeu_epi16

```
void _mm256_mask_cvtepi32_storeu_epi16(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovdw

Convert packed 32-bit integers in *a* to packed 16-bit integers with truncation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm_mask_cvtepi64_storeu_epi8

```
void _mm_mask_cvtepi64_storeu_epi8(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqb

Convert packed 64-bit integers in *a* to packed 8-bit integers with truncation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm256_mask_cvtepi64_storeu_epi8

```
void _mm256_mask_cvtepi64_storeu_epi8(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqb

Convert packed 64-bit integers in *a* to packed 8-bit integers with truncation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm_mask_cvtepi64_storeu_epi32

```
void _mm_mask_cvtepi64_storeu_epi32(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqd

Convert packed 64-bit integers in *a* to packed 32-bit integers with truncation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm256_mask_cvtepi64_storeu_epi32

```
void _mm256_mask_cvtepi64_storeu_epi32(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqd

Convert packed 64-bit integers in *a* to packed 32-bit integers with truncation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm_mask_cvtepi64_storeu_epi16

```
void _mm_mask_cvtepi64_storeu_epi16(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqw

Convert packed 64-bit integers in *a* to packed 16-bit integers with truncation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm256_mask_cvtepi64_storeu_epi16

```
void _mm256_mask_cvtepi64_storeu_epi16(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovqw

Convert packed 64-bit integers in *a* to packed 16-bit integers with truncation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm_mask_cvtsepi32_storeu_epi8

```
void _mm_mask_cvtsepi32_storeu_epi8(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsdb

Convert packed 32-bit integers in *a* to packed 8-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm256_mask_cvtsepi32_storeu_epi8

```
void _mm256_mask_cvtsepi32_storeu_epi8(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsdb

Convert packed 32-bit integers in *a* to packed 8-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm_mask_cvtsepi32_storeu_epi16

```
void _mm_mask_cvtsepi32_storeu_epi16(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsdw

Convert packed 32-bit integers in *a* to packed 16-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm256_mask_cvtsepi32_storeu_epi16

```
void _mm256_mask_cvtsepi32_storeu_epi16(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsdw

Convert packed 32-bit integers in *a* to packed 16-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm_mask_cvtsepi64_storeu_epi8

```
void _mm_mask_cvtsepi64_storeu_epi8(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqb

Convert packed 64-bit integers in *a* to packed 8-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm256_mask_cvtsepi64_storeu_epi8

```
void _mm256_mask_cvtsepi64_storeu_epi8(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqb

Convert packed 64-bit integers in *a* to packed 8-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm_mask_cvtsepi64_storeu_epi32

```
void _mm_mask_cvtsepi64_storeu_epi32(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqd

Convert packed 64-bit integers in *a* to packed 32-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm256_mask_cvtsepi64_storeu_epi32

```
void _mm256_mask_cvtsepi64_storeu_epi32(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqd

Convert packed 64-bit integers in *a* to packed 32-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm_mask_cvtsepi64_storeu_epi16

```
void _mm_mask_cvtsepi64_storeu_epi16(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqw

Convert packed 64-bit integers in *a* to packed 16-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm256_mask_cvtsepi64_storeu_epi16

```
void _mm256_mask_cvtsepi64_storeu_epi16(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovsqw

Convert packed 64-bit integers in *a* to packed 16-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm_mask_cvtsepi16_storeu_epi8

```
void _mm_mask_cvtsepi16_storeu_epi8(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovswb

Convert packed 16-bit integers in *a* to packed 8-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm256_mask_cvtsepi16_storeu_epi8

```
void _mm256_mask_cvtsepi16_storeu_epi8(void* base_addr, __mmask16 k, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovswb

Convert packed 16-bit integers in *a* to packed 8-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm512_mask_cvtsepi16_storeu_epi8

```
void _mm512_mask_cvtsepi16_storeu_epi8(void* base_addr, __mmask32 k, __m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpmovswb

Convert packed 16-bit integers in *a* to packed 8-bit integers with signed saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm_mask_cvtusepi32_storeu_epi8

```
void _mm_mask_cvtusepi32_storeu_epi8(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusdb

Convert packed unsigned 32-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm256_mask_cvtusepi32_storeu_epi8

```
void _mm256_mask_cvtusepi32_storeu_epi8(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusdb

Convert packed unsigned 32-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm_mask_cvtusepi32_storeu_epi16

```
void _mm_mask_cvtusepi32_storeu_epi16(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusdw

Convert packed unsigned 32-bit integers in *a* to packed unsigned 16-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm256_mask_cvtusepi32_storeu_epi16

```
void _mm256_mask_cvtusepi32_storeu_epi16(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusdw

Convert packed unsigned 32-bit integers in *a* to packed unsigned 16-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm_mask_cvtusepi64_storeu_epi8

```
void _mm_mask_cvtusepi64_storeu_epi8(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqb

Convert packed unsigned 64-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm256_mask_cvtusepi64_storeu_epi8

```
void _mm256_mask_cvtusepi64_storeu_epi8(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqb

Convert packed unsigned 64-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm_mask_cvtusepi64_storeu_epi32

```
void _mm_mask_cvtusepi64_storeu_epi32(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqd

Convert packed unsigned 64-bit integers in *a* to packed unsigned 32-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm256_mask_cvtusepi64_storeu_epi32

```
void _mm256_mask_cvtusepi64_storeu_epi32(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqd

Convert packed unsigned 64-bit integers in *a* to packed unsigned 32-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm_mask_cvtusepi64_storeu_epi16

```
void _mm_mask_cvtusepi64_storeu_epi16(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqw

Convert packed unsigned 64-bit integers in *a* to packed unsigned 16-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm256_mask_cvtusepi64_storeu_epi16

```
void _mm256_mask_cvtusepi64_storeu_epi16(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpmovusqw

Convert packed unsigned 64-bit integers in *a* to packed unsigned 16-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm_mask_cvtusepi16_storeu_epi8

```
void _mm_mask_cvtusepi16_storeu_epi8(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovuswb

Convert packed unsigned 16-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm256_mask_cvtusepi16_storeu_epi8

```
void _mm256_mask_cvtusepi16_storeu_epi8(void* base_addr, __mmask16 k, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovuswb

Convert packed unsigned 16-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm512_mask_cvtusepi16_storeu_epi8

```
void _mm512_mask_cvtusepi16_storeu_epi8(void* base_addr, __mmask32 k, __m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpmovuswb

Convert packed unsigned 16-bit integers in *a* to packed unsigned 8-bit integers with unsigned saturation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm_mask_cvtepi16_storeu_epi8

```
void _mm_mask_cvtepi16_storeu_epi8(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovwb

Convert packed 16-bit integers in *a* to packed 8-bit integers with truncation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm256_mask_cvtepi16_storeu_epi8

```
void _mm256_mask_cvtepi16_storeu_epi8(void* base_addr, __mmask16 k, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovwb

Convert packed 16-bit integers in *a* to packed 8-bit integers with truncation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm512_mask_cvtepi16_storeu_epi8

```
void _mm512_mask_cvtepi16_storeu_epi8(void* base_addr, __mmask32 k, __m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpmovwb

Convert packed 16-bit integers in *a* to packed 8-bit integers with truncation, and store the active results (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

Intrinsics for Load Operations

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `zmmintrin.h` header file.
To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

variable	definition
src	source element to use based on writemask result
k	writemask used as a selector
mem_addr	pointer to base address in memory
base_addr	pointer to base address in memory to begin load or store operation

_mm_mask_expandloadu_pd

```
__m128d _mm_mask_expandloadu_pd(__m128d src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vexpandpd

Load as many contiguous double-precision (64-bit) floating-point elements from unaligned memory at *mem_addr* as there are ones in the low 2 bits of mask *k*, and place them in the result element positions corresponding to the positions of the ones in the mask (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_expandloadu_pd

```
__m128d _mm_maskz_expandloadu_pd(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vexpandpd

Load as many contiguous double-precision (64-bit) floating-point elements from unaligned memory at *mem_addr* as there are ones in the low 2 bits of mask *k*, and place them in the result element positions corresponding to the positions of the ones in the mask (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_expandloadu_pd

```
__m256d _mm256_mask_expandloadu_pd(__m256d src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vexpandpd

Load as many contiguous double-precision (64-bit) floating-point elements from unaligned memory at *mem_addr* as there are ones in the low 4 bits of mask *k*, and place them in the result element positions corresponding to the positions of the ones in the mask (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_expandloadu_pd

```
__m256d _mm256_maskz_expandloadu_pd(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vexpandpd

Load as many contiguous double-precision (64-bit) floating-point elements from unaligned memory at *mem_addr* as there are ones in the low 4 bits of mask *k*, and place them in the result element positions corresponding to the positions of the ones in the mask (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_expandloadu_ps

```
__m128 _mm_mask_expandloadu_ps(__m128 src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vexpandps

Load as many contiguous single-precision (32-bit) floating-point elements from unaligned memory at *mem_addr* as there are ones in the low 4 bits of mask *k*, and place them in the result element positions corresponding to the positions of the ones in the mask (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_expandloadu_ps

```
__m128 _mm_maskz_expandloadu_ps(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vexpandps

Load as many contiguous single-precision (32-bit) floating-point elements from unaligned memory at *mem_addr* as there are ones in the low 4 bits of mask *k*, and place them in the result element positions corresponding to the positions of the ones in the mask (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_expandloadu_ps

```
__m256 _mm256_mask_expandloadu_ps(__m256 src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vexpandps

Load as many contiguous single-precision (32-bit) floating-point elements from unaligned memory at *mem_addr* as there are ones in the low 8 bits of mask *k*, and place them in the result element positions corresponding to the positions of the ones in the mask (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_expandloadu_ps

```
__m256 _mm256_maskz_expandloadu_ps(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vexpandps

Load as many contiguous single-precision (32-bit) floating-point elements from unaligned memory at *mem_addr* as there are ones in the low 8 bits of mask *k*, and place them in the result element positions corresponding to the positions of the ones in the mask (elements are zeroed out when the corresponding mask bit is not set).

_mm_mmask_i32gather_pd

```
__m128d _mm_mmask_i32gather_pd(__m128d src, __mmask8 k, __m128i vindex, void const* base_addr,
const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgatherdpd

Gather double-precision (64-bit) floating-point elements from memory using 32-bit indices. 64-bit elements are loaded from addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*). Gathered elements are merged into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm256_mmask_i32gather_pd

```
__m256d _mm256_mmask_i32gather_pd(__m256d src, __mmask8 k, __m128i vindex, void const*
base_addr, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgatherdpd

Gather double-precision (64-bit) floating-point elements from memory using 32-bit indices. 64-bit elements are loaded from addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*). Gathered elements are merged into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm_mmask_i32gather_ps

```
__m128 _mm_mmask_i32gather_ps(__m128 src, __mmask8 k, __m128i vindex, void const* base_addr,
const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgatherdps

Gather single-precision (32-bit) floating-point elements from memory using 32-bit indices. 32-bit elements are loaded from addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*). Gathered elements are merged into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm256_mmask_i32gather_ps

```
__m256 _mm256_mmask_i32gather_ps(__m256 src, __mmask8 k, __m256i vindex, void const* base_addr,
const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgatherdps

Gather single-precision (32-bit) floating-point elements from memory using 32-bit indices. 32-bit elements are loaded from addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*). Gathered elements are merged into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm_mmask_i64gather_pd

```
__m128d _mm_mmask_i64gather_pd(__m128d src, __mmask8 k, __m128i vindex, void const* base_addr,
const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgatherqpd

Gather double-precision (64-bit) floating-point elements from memory using 64-bit indices. 64-bit elements are loaded from addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*). Gathered elements are merged into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm256_mmask_i64gather_pd

```
__m256d _mm256_mmask_i64gather_pd(__m256d src, __mmask8 k, __m256i vindex, void const*
base_addr, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgatherqpd

Gather double-precision (64-bit) floating-point elements from memory using 64-bit indices. 64-bit elements are loaded from addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*). Gathered elements are merged into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm_mmask_i64gather_ps

```
__m128 _mm_mmask_i64gather_ps(__m128 src, __mmask8 k, __m128i vindex, void const* base_addr,
const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgatherqps

Gather single-precision (32-bit) floating-point elements from memory using 64-bit indices. 32-bit elements are loaded from addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*). Gathered elements are merged into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm256_mmask_i64gather_ps

```
__m128 _mm256_mmask_i64gather_ps(__m128 src, __mmask8 k, __m256i vindex, void const* base_addr,
const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgatherqps

Gather single-precision (32-bit) floating-point elements from memory using 64-bit indices. 32-bit elements are loaded from addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*). Gathered elements are merged into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm_mask_load_pd

```
__m128d _mm_mask_load_pd(__m128d src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovapd

Load packed double-precision (64-bit) floating-point elements from memory into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *mem_addr* must be aligned on a 16-byte boundary or a general-protection exception may be generated.

_mm_maskz_load_pd

```
__m128d _mm_maskz_load_pd(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovapd

Load packed double-precision (64-bit) floating-point elements from memory into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *mem_addr* must be aligned on a 16-byte boundary or a general-protection exception may be generated.

_mm256_mask_load_pd

```
__m256d _mm256_mask_load_pd(__m256d src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovapd

Load packed double-precision (64-bit) floating-point elements from memory into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *mem_addr* must be aligned on a 32-byte boundary or a general-protection exception may be generated.

_mm256_maskz_load_pd

```
__m256d _mm256_maskz_load_pd(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovapd

Load packed double-precision (64-bit) floating-point elements from memory into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *mem_addr* must be aligned on a 32-byte boundary or a general-protection exception may be generated.

_mm_mask_load_ps

```
__m128 _mm_mask_load_ps(__m128 src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovaps

Load packed single-precision (32-bit) floating-point elements from memory into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *mem_addr* must be aligned on a 16-byte boundary or a general-protection exception may be generated.

_mm_maskz_load_ps

```
__m128 _mm_maskz_load_ps(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovaps

Load packed single-precision (32-bit) floating-point elements from memory into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *mem_addr* must be aligned on a 16-byte boundary or a general-protection exception may be generated.

_mm256_mask_load_ps

```
__m256 _mm256_mask_load_ps(__m256 src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovaps

Load packed single-precision (32-bit) floating-point elements from memory into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *mem_addr* must be aligned on a 32-byte boundary or a general-protection exception may be generated.

_mm256_maskz_load_ps

```
__m256 _mm256_maskz_load_ps(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovaps

Load packed single-precision (32-bit) floating-point elements from memory into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *mem_addr* must be aligned on a 32-byte boundary or a general-protection exception may be generated.

_mm_mask_loadu_pd

```
__m128d _mm_mask_loadu_pd(__m128d src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovupd

Load packed double-precision (64-bit) floating-point elements from memoy into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm_maskz_loadu_pd

```
__m128d _mm_maskz_loadu_pd(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovupd

Load packed double-precision (64-bit) floating-point elements from memoy into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm256_mask_loadu_pd

```
__m256d _mm256_mask_loadu_pd(__m256d src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovupd

Load packed double-precision (64-bit) floating-point elements from memoy into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm256_maskz_loadu_pd

```
__m256d _mm256_maskz_loadu_pd(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovupd

Load packed double-precision (64-bit) floating-point elements from memoy into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm_mask_loadu_ps

```
__m128 _mm_mask_loadu_ps(__m128 src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovups

Load packed single-precision (32-bit) floating-point elements from memory into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm_maskz_loadu_ps

```
__m128 _mm_maskz_loadu_ps(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovups

Load packed single-precision (32-bit) floating-point elements from memory into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm256_mask_loadu_ps

```
__m256 _mm256_mask_loadu_ps(__m256 src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovups

Load packed single-precision (32-bit) floating-point elements from memory into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm256_maskz_loadu_ps

```
__m256 _mm256_maskz_loadu_ps(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovups

Load packed single-precision (32-bit) floating-point elements from memory into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm_mask_load_epi32

```
__m128i _mm_mask_load_epi32(__m128i src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqa32

Load packed 32-bit integers from memory into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *mem_addr* must be aligned on a 16-byte boundary or a general-protection exception may be generated.

_mm_maskz_load_epi32

```
__m128i _mm_maskz_load_epi32(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqa32

Load packed 32-bit integers from memory into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *mem_addr* must be aligned on a 16-byte boundary or a general-protection exception may be generated.

_mm256_mask_load_epi32

```
__m256i _mm256_mask_load_epi32(__m256i src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqa32

Load packed 32-bit integers from memory into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *mem_addr* must be aligned on a 32-byte boundary or a general-protection exception may be generated.

_mm256_maskz_load_epi32

```
__m256i _mm256_maskz_load_epi32(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqa32

Load packed 32-bit integers from memory into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *mem_addr* must be aligned on a 32-byte boundary or a general-protection exception may be generated.

_mm_mask_load_epi64

```
__m128i _mm_mask_load_epi64(__m128i src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqa64

Load packed 64-bit integers from memory into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *mem_addr* must be aligned on a 16-byte boundary or a general-protection exception may be generated.

_mm_maskz_load_epi64

```
__m128i _mm_maskz_load_epi64(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqa64

Load packed 64-bit integers from memory into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *mem_addr* must be aligned on a 16-byte boundary or a general-protection exception may be generated.

_mm256_mask_load_epi64

```
__m256i _mm256_mask_load_epi64(__m256i src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqa64

Load packed 64-bit integers from memory into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *mem_addr* must be aligned on a 32-byte boundary or a general-protection exception may be generated.

_mm256_maskz_load_epi64

```
__m256i _mm256_maskz_load_epi64(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqa64

Load packed 64-bit integers from memory into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *mem_addr* must be aligned on a 32-byte boundary or a general-protection exception may be generated.

_mm_mask_loadu_epi16

```
__m128i _mm_mask_loadu_epi16(__m128i src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vmovdqu16

Load packed 16-bit integers from memory into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm_maskz_loadu_epi16

```
__m128i _mm_maskz_loadu_epi16(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vmovdqu16

Load packed 16-bit integers from memory into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm256_mask_loadu_epi16

```
__m256i _mm256_mask_loadu_epi16(__m256i src, __mmask16 k, void const* mem_addr)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vmovdqu16

Load packed 16-bit integers from memory into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm256_maskz_loadu_epi16

```
__m256i _mm256_maskz_loadu_epi16(__mmask16 k, void const* mem_addr)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vmovdqu16

Load packed 16-bit integers from memory into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm512_mask_loadu_epi16

```
__m512i _mm512_mask_loadu_epi16(__m512i src, __mmask32 k, void const* mem_addr)
```

CPUID Flags: AVX512BW

Instruction(s): vmovdqu16

Load packed 16-bit integers from memory into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm512_maskz_loadu_epi16

```
__m512i _mm512_maskz_loadu_epi16(__mmask32 k, void const* mem_addr)
```

CPUID Flags: AVX512BW

Instruction(s): vmovdqu16

Load packed 16-bit integers from memory into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm_mask_loadu_epi32

```
__m128i _mm_mask_loadu_epi32(__m128i src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqu32

Load packed 32-bit integers from memory into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm_maskz_loadu_epi32

```
__m128i _mm_maskz_loadu_epi32(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqu32

Load packed 32-bit integers from memory into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm256_mask_loadu_epi32

```
__m256i _mm256_mask_loadu_epi32(__m256i src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqu32

Load packed 32-bit integers from memory into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm256_maskz_loadu_epi32

```
__m256i _mm256_maskz_loadu_epi32(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqu32

Load packed 32-bit integers from memory into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm_mask_loadu_epi64

```
__m128i _mm_mask_loadu_epi64(__m128i src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqu64

Load packed 64-bit integers from memory into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm_maskz_loadu_epi64

```
__m128i _mm_maskz_loadu_epi64(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqu64

Load packed 64-bit integers from memory into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm256_mask_loadu_epi64

```
__m256i _mm256_mask_loadu_epi64(__m256i src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqu64

Load packed 64-bit integers from memory into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm256_maskz_loadu_epi64

```
__m256i _mm256_maskz_loadu_epi64(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqu64

Load packed 64-bit integers from memory into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm_mask_loadu_epi8

```
__m128i _mm_mask_loadu_epi8(__m128i src, __mmask16 k, void const* mem_addr)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vmovdqu8

Load packed 8-bit integers from memory into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm_maskz_loadu_epi8

```
__m128i _mm_maskz_loadu_epi8(__mmask16 k, void const* mem_addr)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vmovdqu8

Load packed 8-bit integers from memory into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm256_mask_loadu_epi8

```
__m256i _mm256_mask_loadu_epi8(__m256i src, __mmask32 k, void const* mem_addr)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vmovdqu8

Load packed 8-bit integers from memory into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm256_maskz_loadu_epi8

```
__m256i _mm256_maskz_loadu_epi8(__mmask32 k, void const* mem_addr)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vmovdqu8

Load packed 8-bit integers from memory into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm512_mask_loadu_epi8

```
__m512i _mm512_mask_loadu_epi8(__m512i src, __mmask64 k, void const* mem_addr)
```

CPUID Flags: AVX512BW

Instruction(s): vmovdqu8

Load packed 8-bit integers from memory into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm512_maskz_loadu_epi8

```
__m512i _mm512_maskz_loadu_epi8(__mmask64 k, void const* mem_addr)
```

CPUID Flags: AVX512BW

Instruction(s): vmovdqu8

Load packed 8-bit integers from memory into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *mem_addr* does not need to be aligned on any particular boundary.

_mm_mask_expandloadu_epi32

```
__m128i _mm_mask_expandloadu_epi32(__m128i src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpexpandd

Load as many contiguous 32-bit integers from unaligned memory at *mem_addr* as there are ones in the low 4 bits of mask *k*, and place them in the result element positions corresponding to the positions of the ones in the mask (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_expandloadu_epi32

```
__m128i _mm_maskz_expandloadu_epi32(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpexpandd

Load as many contiguous 32-bit integers from unaligned memory at *mem_addr* as there are ones in the low 4 bits of mask *k*, and place them in the result element positions corresponding to the positions of the ones in the mask (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_expandloadu_epi32

```
__m256i _mm256_mask_expandloadu_epi32(__m256i src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpexpandd

Load as many contiguous 32-bit integers from unaligned memory at *mem_addr* as there are ones in the low 8 bits of mask *k*, and place them in the result element positions corresponding to the positions of the ones in the mask (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_expandloadu_epi32

```
__m256i _mm256_maskz_expandloadu_epi32(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpexpandd

Load as many contiguous 32-bit integers from unaligned memory at *mem_addr* as there are ones in the low 8 bits of mask *k*, and place them in the result element positions corresponding to the positions of the ones in the mask (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_expandloadu_epi64

```
__m128i _mm_mask_expandloadu_epi64(__m128i src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpexpandq

Load as many contiguous 64-bit integers from unaligned memory at *mem_addr* as there are ones in the low 2 bits of mask *k*, and place them in the result element positions corresponding to the positions of the ones in the mask (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_expandloadu_epi64

```
__m128i _mm_maskz_expandloadu_epi64(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpexpandq

Load as many contiguous 64-bit integers from unaligned memory at *mem_addr* as there are ones in the low 2 bits of mask *k*, and place them in the result element positions corresponding to the positions of the ones in the mask (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_expandloadu_epi64

```
__m256i _mm256_mask_expandloadu_epi64(__m256i src, __mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpexpandq

Load as many contiguous 64-bit integers from unaligned memory at *mem_addr* as there are ones in the low 4 bits of mask *k*, and place them in the result element positions corresponding to the positions of the ones in the mask (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_expandloadu_epi64

```
__m256i _mm256_maskz_expandloadu_epi64(__mmask8 k, void const* mem_addr)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpexpandq

Load as many contiguous 64-bit integers from unaligned memory at *mem_addr* as there are ones in the low 4 bits of mask *k*, and place them in the result element positions corresponding to the positions of the ones in the mask (elements are zeroed out when the corresponding mask bit is not set).

_mm_mmask_i32gather_epi32

```
__m128i _mm_mmask_i32gather_epi32(__m128i src, __mmask8 k, __m128i vindex, void const*
base_addr, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpgatherdd

Gather 32-bit integers from memory using 32-bit indices. 32-bit elements are loaded from addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*). Gathered elements are merged into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm256_mmask_i32gather_epi32

```
__m256i _mm256_mmask_i32gather_epi32(__m256i src, __mmask8 k, __m256i vindex, void const*
base_addr, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpgatherdd

Gather 32-bit integers from memory using 32-bit indices. 32-bit elements are loaded from addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*). Gathered elements are merged into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm_mmask_i32gather_epi64

```
__m128i _mm_mmask_i32gather_epi64(__m128i src, __mmask8 k, __m128i vindex, void const*
base_addr, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpgatherdq

Gather 64-bit integers from memory using 32-bit indices. 64-bit elements are loaded from addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*). Gathered elements are merged into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm256_mmask_i32gather_epi64

```
__m256i _mm256_mmask_i32gather_epi64(__m256i src, __mmask8 k, __m128i vindex, void const*
base_addr, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpgatherdq

Gather 64-bit integers from memory using 32-bit indices. 64-bit elements are loaded from addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*). Gathered elements are merged into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm_mmask_i64gather_epi32

```
__m128i _mm_mmask_i64gather_epi32(__m128i src, __mmask8 k, __m128i vindex, void const*
base_addr, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpgatherqd

Gather 32-bit integers from memory using 64-bit indices. 32-bit elements are loaded from addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*). Gathered elements are merged into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm256_mmask_i64gather_epi32

```
__m128i _mm256_mmask_i64gather_epi32(__m128i src, __mmask8 k, __m256i vindex, void const*
base_addr, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpgatherqd

Gather 32-bit integers from memory using 64-bit indices. 32-bit elements are loaded from addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*). Gathered elements are merged into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm_mmask_i64gather_epi64

```
__m128i _mm_mmask_i64gather_epi64(__m128i src, __mmask8 k, __m128i vindex, void const*
base_addr, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpgatherqq

Gather 64-bit integers from memory using 64-bit indices. 64-bit elements are loaded from addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*). Gathered elements are merged into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm256_mmask_i64gather_epi64

```
__m256i _mm256_mmask_i64gather_epi64(__m256i src, __mmask8 k, __m256i vindex, void const*
base_addr, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpgatherqq

Gather 64-bit integers from memory using 64-bit indices. 64-bit elements are loaded from addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*). Gathered elements are merged into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

Intrinsics for Logical Operations

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `zmmintrin.h` header file.

To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

variable	definition
src	source element to use based on writemask result
k	writemask used as a selector
a	first source vector element
b	second source vector element
c	third source vector element
imm	comparison predicate, which can be any of the following values: • `_MM_CMPINT_EQ` - Equal • `_MM_CMPINT_LT` - Less than • `_MM_CMPINT_LE` - Less than or Equal • `_MM_CMPINT_NE` - Not Equal • `_MM_CMPINT_NLT` - Not Less than • `_MM_CMPINT_GE` - Greater than or Equal • `_MM_CMPINT_NLE` - Not Less than or Equal • `_MM_CMPINT_GT` - Greater than

_mm_mask_andnot_pd

```
__m128d _mm_mask_andnot_pd(__m128d src, __mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vandnpd

Compute the bitwise AND NOT of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_andnot_pd

```
__m128d _mm_maskz_andnot_pd(__mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vandnpd

Compute the bitwise AND NOT of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_andnot_pd

```
__m256d _mm256_mask_andnot_pd(__m256d src, __mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vandnpd

Compute the bitwise AND NOT of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_andnot_pd

```
__m256d _mm256_maskz_andnot_pd(__mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vandnpd

Compute the bitwise AND NOT of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_andnot_pd

```
__m512d _mm512_andnot_pd(__m512d a, __m512d b)
```

CPUID Flags: AVX512DQ

Instruction(s): vandnpd

Compute the bitwise AND NOT of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results.

_mm512_mask_andnot_pd

```
__m512d _mm512_mask_andnot_pd(__m512d src, __mmask8 k, __m512d a, __m512d b)
```

CPUID Flags: AVX512DQ

Instruction(s): vandnpd

Compute the bitwise AND NOT of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_andnot_pd

```
__m512d _mm512_maskz_andnot_pd(__mmask8 k, __m512d a, __m512d b)
```

CPUID Flags: AVX512DQ

Instruction(s): vandnpd

Compute the bitwise AND NOT of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_andnot_ps

```
__m128 _mm_mask_andnot_ps(__m128 src, __mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vandnps

Compute the bitwise AND NOT of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_andnot_ps

```
__m128 _mm_maskz_andnot_ps(__mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vandnps

Compute the bitwise AND NOT of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_andnot_ps

```
__m256 _mm256_mask_andnot_ps(__m256 src, __mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vandnps

Compute the bitwise AND NOT of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_andnot_ps

```
__m256 _mm256_maskz_andnot_ps(__mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vandnps

Compute the bitwise AND NOT of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_andnot_ps

```
__m512 _mm512_andnot_ps(__m512 a, __m512 b)
```

CPUID Flags: AVX512DQ

Instruction(s): vandnps

Compute the bitwise AND NOT of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results.

_mm512_mask_andnot_ps

```
__m512 _mm512_mask_andnot_ps(__m512 src, __mmask16 k, __m512 a, __m512 b)
```

CPUID Flags: AVX512DQ

Instruction(s): vandnps

Compute the bitwise AND NOT of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_andnot_ps

```
__m512 _mm512_maskz_andnot_ps(__mmask16 k, __m512 a, __m512 b)
```

CPUID Flags: AVX512DQ

Instruction(s): vandnps

Compute the bitwise AND NOT of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_and_pd

```
__m128d _mm_mask_and_pd(__m128d src, __mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vandpd

Compute the bitwise AND of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_and_pd

```
__m128d _mm_maskz_and_pd(__mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vandpd

Compute the bitwise AND of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_and_pd

```
__m256d _mm256_mask_and_pd(__m256d src, __mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vandpd

Compute the bitwise AND of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_and_pd

```
__m256d _mm256_maskz_and_pd(__mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vandpd

Compute the bitwise AND of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_and_pd

```
__m512d _mm512_and_pd(__m512d a, __m512d b)
```

CPUID Flags: AVX512DQ

Instruction(s): vandpd

Compute the bitwise AND of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results.

_mm512_mask_and_pd

```
__m512d _mm512_mask_and_pd(__m512d src, __mmask8 k, __m512d a, __m512d b)
```

CPUID Flags: AVX512DQ

Instruction(s): vandpd

Compute the bitwise AND of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_and_pd

```
__m512d _mm512_maskz_and_pd(__mmask8 k, __m512d a, __m512d b)
```

CPUID Flags: AVX512DQ

Instruction(s): vandpd

Compute the bitwise AND of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_and_ps

```
__m128 _mm_mask_and_ps(__m128 src, __mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vandps

Compute the bitwise AND of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_and_ps

```
__m128 _mm_maskz_and_ps(__mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vandps

Compute the bitwise AND of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_and_ps

```
__m256 _mm256_mask_and_ps(__m256 src, __mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vandps

Compute the bitwise AND of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_and_ps

```
__m256 _mm256_maskz_and_ps(__mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vandps

Compute the bitwise AND of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_and_ps

```
__m512 _mm512_and_ps(__m512 a, __m512 b)
```

CPUID Flags: AVX512DQ

Instruction(s): vandps

Compute the bitwise AND of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results.

_mm512_mask_and_ps

```
__m512 _mm512_mask_and_ps(__m512 src, __mmask16 k, __m512 a, __m512 b)
```

CPUID Flags: AVX512DQ

Instruction(s): vandps

Compute the bitwise AND of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_and_ps

```
__m512 _mm512_maskz_and_ps(__mmask16 k, __m512 a, __m512 b)
```

CPUID Flags: AVX512DQ

Instruction(s): vandps

Compute the bitwise AND of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_or_pd

```
__m128d _mm_mask_or_pd(__m128d src, __mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vorpd

Compute the bitwise OR of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_or_pd

```
__m128d _mm_maskz_or_pd(__mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vorpd

Compute the bitwise OR of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_or_pd

```
__m256d _mm256_mask_or_pd(__m256d src, __mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vorpd

Compute the bitwise OR of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_or_pd

```
__m256d _mm256_maskz_or_pd(__mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vorpd

Compute the bitwise OR of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_or_pd

```
__m512d _mm512_mask_or_pd(__m512d src, __mmask8 k, __m512d a, __m512d b)
```

CPUID Flags: AVX512DQ

Instruction(s): vorpd

Compute the bitwise OR of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_or_pd

```
__m512d _mm512_maskz_or_pd(__mmask8 k, __m512d a, __m512d b)
```

CPUID Flags: AVX512DQ

Instruction(s): vorpd

Compute the bitwise OR of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_or_pd

```
__m512d _mm512_or_pd(__m512d a, __m512d b)
```

CPUID Flags: AVX512DQ

Instruction(s): vorpd

Compute the bitwise OR of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results.

_mm_mask_or_ps

```
__m128 _mm_mask_or_ps(__m128 src, __mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vorps

Compute the bitwise OR of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_or_ps

```
__m128 _mm_maskz_or_ps(__mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vorps

Compute the bitwise OR of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_or_ps

```
__m256 _mm256_mask_or_ps(__m256 src, __mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vorps

Compute the bitwise OR of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_or_ps

```
__m256 _mm256_maskz_or_ps(__mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vorps

Compute the bitwise OR of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_or_ps

```
__m512 _mm512_mask_or_ps(__m512 src, __mmask16 k, __m512 a, __m512 b)
```

CPUID Flags: AVX512DQ

Instruction(s): vorps

Compute the bitwise OR of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_or_ps

```
__m512 _mm512_maskz_or_ps(__mmask16 k, __m512 a, __m512 b)
```

CPUID Flags: AVX512DQ

Instruction(s): vorps

Compute the bitwise OR of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_or_ps

```
__m512 _mm512_or_ps(__m512 a, __m512 b)
```

CPUID Flags: AVX512DQ

Instruction(s): vorps

Compute the bitwise OR of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results.

_mm_mask_xor_pd

```
__m128d _mm_mask_xor_pd(__m128d src, __mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vxorpd

Compute the bitwise XOR of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_xor_pd

```
__m128d _mm_maskz_xor_pd(__mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vxorpd

Compute the bitwise XOR of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_xor_pd

```
__m256d _mm256_mask_xor_pd(__m256d src, __mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vxorpd

Compute the bitwise XOR of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_xor_pd

```
__m256d _mm256_maskz_xor_pd(__mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vxorpd

Compute the bitwise XOR of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_xor_pd

```
__m512d _mm512_mask_xor_pd(__m512d src, __mmask8 k, __m512d a, __m512d b)
```

CPUID Flags: AVX512DQ

Instruction(s): vxorpd

Compute the bitwise XOR of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_xor_pd

```
__m512d _mm512_maskz_xor_pd(__mmask8 k, __m512d a, __m512d b)
```

CPUID Flags: AVX512DQ

Instruction(s): vxorpd

Compute the bitwise XOR of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_xor_pd

```
__m512d _mm512_xor_pd(__m512d a, __m512d b)
```

CPUID Flags: AVX512DQ

Instruction(s): vxorpd

Compute the bitwise XOR of packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results.

_mm_mask_xor_ps

```
__m128 _mm_mask_xor_ps(__m128 src, __mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vxorps

Compute the bitwise XOR of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_xor_ps

```
__m128 _mm_maskz_xor_ps(__mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vxorps

Compute the bitwise XOR of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_xor_ps

```
__m256 _mm256_mask_xor_ps(__m256 src, __mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vxorps

Compute the bitwise XOR of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_xor_ps

```
__m256 _mm256_maskz_xor_ps(__mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vxorps

Compute the bitwise XOR of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_xor_ps

```
__m512 _mm512_mask_xor_ps(__m512 src, __mmask16 k, __m512 a, __m512 b)
```

CPUID Flags: AVX512DQ

Instruction(s): vxorps

Compute the bitwise XOR of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_xor_ps

```
__m512 _mm512_maskz_xor_ps(__mmask16 k, __m512 a, __m512 b)
```

CPUID Flags: AVX512DQ

Instruction(s): vxorps

Compute the bitwise XOR of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_xor_ps

```
__m512 _mm512_xor_ps(__m512 a, __m512 b)
```

CPUID Flags: AVX512DQ

Instruction(s): vxorps

Compute the bitwise XOR of packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results.

_mm_mask_and_epi32

```
__m128i _mm_mask_and_epi32(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpandd

Compute the bitwise AND of packed 32-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_and_epi32

```
__m128i _mm_maskz_and_epi32(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpandd

Compute the bitwise AND of packed 32-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_and_epi32

```
__m256i _mm256_mask_and_epi32(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpandd

Compute the bitwise AND of packed 32-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_and_epi32

```
__m256i _mm256_maskz_and_epi32(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpandd

Compute the bitwise AND of packed 32-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_andnot_epi32

```
__m128i _mm_mask_andnot_epi32(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpandnd

Compute the bitwise AND NOT of packed 32-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_andnot_epi32

```
__m128i _mm_maskz_andnot_epi32(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpandnd

Compute the bitwise AND NOT of packed 32-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_andnot_epi32

```
__m256i _mm256_mask_andnot_epi32(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpandnd

Compute the bitwise AND NOT of packed 32-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_andnot_epi32

```
__m256i _mm256_maskz_andnot_epi32(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpandnd

Compute the bitwise AND NOT of packed 32-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_andnot_epi64

```
__m128i _mm_mask_andnot_epi64(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpandnq

Compute the bitwise AND NOT of packed 64-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_andnot_epi64

```
__m128i _mm_maskz_andnot_epi64(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpandnq

Compute the bitwise AND NOT of packed 64-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_andnot_epi64

```
__m256i _mm256_mask_andnot_epi64(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpandnq

Compute the bitwise AND NOT of packed 64-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_andnot_epi64

```
__m256i _mm256_maskz_andnot_epi64(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpandnq

Compute the bitwise AND NOT of packed 64-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_and_epi64

```
__m128i _mm_mask_and_epi64(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpandq

Compute the bitwise AND of packed 64-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_and_epi64

```
__m128i _mm_maskz_and_epi64(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpandq

Compute the bitwise AND of packed 64-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_and_epi64

```
__m256i _mm256_mask_and_epi64(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpandq

Compute the bitwise AND of packed 64-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_and_epi64

```
__m256i _mm256_maskz_and_epi64(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpandq

Compute the bitwise AND of packed 64-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_or_epi32

```
__m128i _mm_mask_or_epi32(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpord

Compute the bitwise OR of packed 32-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_or_epi32

```
__m128i _mm_maskz_or_epi32(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpord

Compute the bitwise OR of packed 32-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_or_epi32

```
__m256i _mm256_mask_or_epi32(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpord

Compute the bitwise OR of packed 32-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_or_epi32

```
__m256i _mm256_maskz_or_epi32(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpord

Compute the bitwise OR of packed 32-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_or_epi64

```
__m128i _mm_mask_or_epi64(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vporq

Compute the bitwise OR of packed 64-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_or_epi64

```
__m128i _mm_maskz_or_epi64(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vporq

Compute the bitwise OR of packed 64-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_or_epi64

```
__m256i _mm256_mask_or_epi64(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vporq

Compute the bitwise OR of packed 64-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_or_epi64

```
__m256i _mm256_maskz_or_epi64(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vporq

Compute the bitwise OR of packed 64-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_ternarylogic_epi32

```
__m128i _mm_mask_ternarylogic_epi32(__m128i src, __mmask8 k, __m128i a, __m128i b, int imm8)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpternlogd

Bitwise ternary logic that provides the capability to implement any three-operand binary function; the specific binary function is specified by value in *imm8*. For each bit in each packed 32-bit integer, the corresponding bit from *src*, *a*, and *b* are used to form a 3 bit index into *imm8*, and the value at that bit in *imm8* is written to the corresponding bit in the return value using writemask *k* at 32-bit granularity (32-bit elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_ternarylogic_epi32

```
__m128i _mm_maskz_ternarylogic_epi32(__mmask8 k, __m128i a, __m128i b, __m128i c, int imm8)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpternlogd

Bitwise ternary logic that provides the capability to implement any three-operand binary function; the specific binary function is specified by value in *imm8*. For each bit in each packed 32-bit integer, the corresponding bit from *a*, *b*, and *c* are used to form a 3 bit index into *imm8*, and the value at that bit in *imm8* is written to the corresponding bit in the return value using zeromask *k* at 32-bit granularity (32-bit elements are zeroed out when the corresponding mask bit is not set).

_mm_ternarylogic_epi32

```
__m128i _mm_ternarylogic_epi32(__m128i a, __m128i b, __m128i c, int imm8)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpternlogd

Bitwise ternary logic that provides the capability to implement any three-operand binary function; the specific binary function is specified by value in *imm8*. For each bit in each packed 32-bit integer, the corresponding bit from *a*, *b*, and *c* are used to form a 3 bit index into *imm8*, and the value at that bit in *imm8* is written to the corresponding bit in the return value.

```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpternlogq

Bitwise ternary logic that provides the capability to implement any three-operand binary function; the specific binary function is specified by value in *imm8*. For each bit in each packed 64-bit integer, the corresponding bit from *src*, *a*, and *b* are used to form a 3 bit index into *imm8*, and the value at that bit in *imm8* is written to the corresponding bit in the return value using writemask *k* at 64-bit granularity (64-bit elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_ternarylogic_epi64

```
__m128i _mm_maskz_ternarylogic_epi64(__mmask8 k, __m128i a, __m128i b, __m128i c, int imm8)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpternlogq

Bitwise ternary logic that provides the capability to implement any three-operand binary function; the specific binary function is specified by value in *imm8*. For each bit in each packed 64-bit integer, the corresponding bit from *a*, *b*, and *c* are used to form a 3 bit index into *imm8*, and the value at that bit in *imm8* is written to the corresponding bit in the return value using zeromask *k* at 64-bit granularity (64-bit elements are zeroed out when the corresponding mask bit is not set).

_mm_ternarylogic_epi64

```
__m128i _mm_ternarylogic_epi64(__m128i a, __m128i b, __m128i c, int imm8)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpternlogq

Bitwise ternary logic that provides the capability to implement any three-operand binary function; the specific binary function is specified by value in *imm8*. For each bit in each packed 64-bit integer, the corresponding bit from *a*, *b*, and *c* are used to form a 3 bit index into *imm8*, and the value at that bit in *imm8* is written to the corresponding bit in the return value.

_mm256_mask_ternarylogic_epi64

```
__m256i _mm256_mask_ternarylogic_epi64(__m256i src, __mmask8 k, __m256i a, __m256i b, int imm8)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpternlogq

Bitwise ternary logic that provides the capability to implement any three-operand binary function; the specific binary function is specified by value in *imm8*. For each bit in each packed 64-bit integer, the corresponding bit from *src*, *a*, and *b* are used to form a 3 bit index into *imm8*, and the value at that bit in *imm8* is written to the corresponding bit in the return value using writemask *k* at 64-bit granularity (64-bit elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_ternarylogic_epi64

```
__m256i _mm256_maskz_ternarylogic_epi64(__mmask8 k, __m256i a, __m256i b, __m256i c, int imm8)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpternlogq

Bitwise ternary logic that provides the capability to implement any three-operand binary function; the specific binary function is specified by value in *imm8*. For each bit in each packed 64-bit integer, the corresponding bit from *a*, *b*, and *c* are used to form a 3 bit index into *imm8*, and the value at that bit in *imm8* is written to the corresponding bit in the return value using zeromask *k* at 64-bit granularity (64-bit elements are zeroed out when the corresponding mask bit is not set).

```
__m256i _mm256_ternarylogic_epi64(__m256i a, __m256i b, __m256i c, int imm8)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpternlogq

Bitwise ternary logic that provides the capability to implement any three-operand binary function; the specific binary function is specified by value in *imm8*. For each bit in each packed 64-bit integer, the corresponding bit from *a*, *b*, and *c* are used to form a 3 bit index into *imm8*, and the value at that bit in *imm8* is written to the corresponding bit in the return value.

_mm_mask_xor_epi32

```
__m128i _mm_mask_xor_epi32(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpxord

Compute the bitwise XOR of packed 32-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_xor_epi32

```
__m128i _mm_maskz_xor_epi32(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpxord

Compute the bitwise XOR of packed 32-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_xor_epi32

```
__m256i _mm256_mask_xor_epi32(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpxord

Compute the bitwise XOR of packed 32-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_xor_epi32

```
__m256i _mm256_maskz_xor_epi32(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpxord

Compute the bitwise XOR of packed 32-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_xor_epi64

```
__m128i _mm_mask_xor_epi64(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpxorq

Compute the bitwise XOR of packed 64-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_xor_epi64

```
__m128i _mm_maskz_xor_epi64(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpxorq

Compute the bitwise XOR of packed 64-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_xor_epi64

```
__m256i _mm256_mask_xor_epi64(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpxorq

Compute the bitwise XOR of packed 64-bit integers in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_xor_epi64

```
__m256i _mm256_maskz_xor_epi64(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpxorq

Compute the bitwise XOR of packed 64-bit integers in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

Intrinsics for Miscellaneous Operations

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `zmmintrin.h` header file.
To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

variable	definition
src	source element to use based on writemask result
k	writemask used as a selector
a	first source vector element
b	second source vector element
c	third source vector element
rounding	Rounding control values; these can be one of the following (along with the `sae` suppress all exceptions flag): • `_MM_FROUND_TO_NEAREST_INT` - rounds to nearest even • `_MM_FROUND_TO_NEG_INF` - rounds to negative infinity • `_MM_FROUND_TO_POS_INF` - rounds to positive infinity • `_MM_FROUND_TO_ZERO` - rounds to zero • `_MM_FROUND_CUR_DIRECTION` - rounds using default from MXCSR register
interv	Where `_MM_MANTISSA_NORM_ENUM` can be one of the following: • `_MM_MANT_NORM_1_2` - interval [1, 2) • `_MM_MANT_NORM_p5_2` - interval [1.5, 2) • `_MM_MANT_NORM_p5_1` - interval [1.5, 1) • `_MM_MANT_NORM_p75_1p5` - interval [0.75, 1.5)

variable	definition
sc	Where `_MM_MANTISSA_SIGN_ENUM` can be one of the following: • `_MM_MANT_SIGN_src` - sign = sign(SRC) • `_MM_MANT_SIGN_zero` - sign = 0 • `_MM_MANT_SIGN_nan` - DEST = NaN if sign(SRC) = 1

_mm_broadcast_i32x2

```
__m128i _mm_broadcast_i32x2(__m128i a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vbroadcasti32x2

Broadcast the lower 2 packed 32-bit integers from *a* to all elements of "dst.

_mm_mask_broadcast_i32x2

```
__m128i _mm_mask_broadcast_i32x2(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vbroadcasti32x2

Broadcast the lower 2 packed 32-bit integers from *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_broadcast_i32x2

```
__m128i _mm_maskz_broadcast_i32x2(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vbroadcasti32x2

Broadcast the lower 2 packed 32-bit integers from *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_broadcast_i32x2

```
__m256i _mm256_broadcast_i32x2(__m128i a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vbroadcasti32x2

Broadcast the lower 2 packed 32-bit integers from *a* to all elements of "dst.

_mm256_mask_broadcast_i32x2

```
__m256i _mm256_mask_broadcast_i32x2(__m256i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vbroadcasti32x2

Broadcast the lower 2 packed 32-bit integers from *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_broadcast_i32x2

```
__m256i _mm256_maskz_broadcast_i32x2(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vbroadcasti32x2

Broadcast the lower 2 packed 32-bit integers from *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_broadcast_i32x2

```
__m512i _mm512_broadcast_i32x2(__m128i a)
```

CPUID Flags: AVX512DQ

Instruction(s): vbroadcasti32x2

Broadcast the lower 2 packed 32-bit integers from *a* to all elements of "dst.

_mm512_mask_broadcast_i32x2

```
__m512i _mm512_mask_broadcast_i32x2(__m512i src, __mmask16 k, __m128i a)
```

CPUID Flags: AVX512DQ

Instruction(s): vbroadcasti32x2

Broadcast the lower 2 packed 32-bit integers from *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_broadcast_i32x2

```
__m512i _mm512_maskz_broadcast_i32x2(__mmask16 k, __m128i a)
```

CPUID Flags: AVX512DQ

Instruction(s): vbroadcasti32x2

Broadcast the lower 2 packed 32-bit integers from *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_broadcast_i32x4

```
__m256i _mm256_broadcast_i32x4(__m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vbroadcasti32x4

Broadcast the 4 packed 32-bit integers from *a* to all elements of the return value.

_mm256_mask_broadcast_i32x4

```
__m256i _mm256_mask_broadcast_i32x4(__m256i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vbroadcasti32x4

Broadcast the 4 packed 32-bit integers from *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_broadcast_i32x4

```
__m256i _mm256_maskz_broadcast_i32x4(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vbroadcasti32x4

Broadcast the 4 packed 32-bit integers from *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_broadcast_i32x8

```
__m512i _mm512_broadcast_i32x8(__m256i a)
```

CPUID Flags: AVX512DQ

Instruction(s): vbroadcasti32x8

Broadcast the 8 packed 32-bit integers from *a* to all elements of the return value.

_mm512_mask_broadcast_i32x8

```
__m512i _mm512_mask_broadcast_i32x8(__m512i src, __mmask16 k, __m256i a)
```

CPUID Flags: AVX512DQ

Instruction(s): vbroadcasti32x8

Broadcast the 8 packed 32-bit integers from *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_broadcast_i32x8

_mm256_inserti32x4

```
__m256i _mm256_inserti32x4(__m256i a, __m128i b, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vinserti32x4

Copy *a* to the return value, then insert 128 bits (composed of 4 packed 32-bit integers) from *b* into *dst* at the location specified by *imm*.

_mm256_mask_inserti32x4

```
__m256i _mm256_mask_inserti32x4(__m256i src, __mmask8 k, __m256i a, __m128i b, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vinserti32x4

Copy *a* to *tmp*, then insert 128 bits (composed of 4 packed 32-bit integers) from *b* into *tmp* at the location specified by *imm*. Store *tmp* to the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_inserti32x4

```
__m256i _mm256_maskz_inserti32x4(__mmask8 k, __m256i a, __m128i b, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vinserti32x4

Copy *a* to *tmp*, then insert 128 bits (composed of 4 packed 32-bit integers) from *b* into *tmp* at the location specified by *imm*. Store *tmp* to the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_inserti32x8

```
__m512i _mm512_inserti32x8(__m512i a, __m256i b, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vinserti32x8

Copy *a* to the return value, then insert 256 bits (composed of 8 packed 32-bit integers) from *b* into *dst* at the location specified by *imm*.

_mm512_mask_inserti32x8

```

```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vshufi64x2

Shuffle 128-bits (composed of 2 64-bit integers) selected by *imm* from *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_shuffle_i64x2

```
__m256i _mm256_shuffle_i64x2(__m256i a, __m256i b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vshufi64x2

Shuffle 128-bits (composed of 2 64-bit integers) selected by *imm* from *a* and *b*, and return the results.

_mm_mask_blend_pd

```
__m128d _mm_mask_blend_pd(__mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vblendmpd

Blend packed double-precision (64-bit) floating-point elements from *a* and *b* using control mask *k*, and return the results.

_mm256_mask_blend_pd

```
__m256d _mm256_mask_blend_pd(__mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vblendmpd

Blend packed double-precision (64-bit) floating-point elements from *a* and *b* using control mask *k*, and return the results.

_mm_mask_blend_ps

```
__m128 _mm_mask_blend_ps(__mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vblendmps

Blend packed single-precision (32-bit) floating-point elements from *a* and *b* using control mask *k*, and return the results.

_mm256_mask_blend_ps

```
__m256 _mm256_mask_blend_ps(__mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vblendmps

Blend packed single-precision (32-bit) floating-point elements from *a* and *b* using control mask *k*, and return the results.

_mm256_broadcast_f32x2

```
__m256 _mm256_broadcast_f32x2(__m128 a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vbroadcastf32x2

Broadcast the lower 2 packed single-precision (32-bit) floating-point elements from *a* to all elements of the return value.

_mm256_mask_broadcast_f32x2

```
__m256 _mm256_mask_broadcast_f32x2(__m256 src, __mmask8 k, __m128 a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vbroadcastf32x2

Broadcast the lower 2 packed single-precision (32-bit) floating-point elements from *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_broadcast_f32x2

```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vbroadcastss

Broadcast the low single-precision (32-bit) floating-point element from *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_broadcastss_ps

```
__m128 _mm_maskz_broadcastss_ps(__mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vbroadcastss

Broadcast the low single-precision (32-bit) floating-point element from *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_broadcastss_ps

```
__m256 _mm256_mask_broadcastss_ps(__m256 src, __mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vbroadcastss

Broadcast the low single-precision (32-bit) floating-point element from *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_broadcastss_ps

```
__m256 _mm256_maskz_broadcastss_ps(__mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vbroadcastss

Broadcast the low single-precision (32-bit) floating-point element from *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_compress_pd

```
__m128d _mm_mask_compress_pd(__m128d src, __mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcompresspd

Contiguously store the active double-precision (64-bit) floating-point elements in *a* (those with their respective bit set in writemask *k*) to the return value, and pass through the remaining elements from *src*.

_mm_maskz_compress_pd

```
__m128d _mm_maskz_compress_pd(__mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcompresspd

Contiguously store the active double-precision (64-bit) floating-point elements in *a* (those with their respective bit set in zeromask *k*) to the return value, and set the remaining elements to zero.

_mm256_mask_compress_pd

```
__m256d _mm256_mask_compress_pd(__m256d src, __mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcompresspd

Contiguously store the active double-precision (64-bit) floating-point elements in *a* (those with their respective bit set in writemask *k*) to the return value, and pass through the remaining elements from *src*.

_mm256_maskz_compress_pd

```
__m256d _mm256_maskz_compress_pd(__mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcompresspd

Contiguously store the active double-precision (64-bit) floating-point elements in *a* (those with their respective bit set in zeromask *k*) to the return value, and set the remaining elements to zero.

_mm_mask_compress_ps

```
__m128 _mm_mask_compress_ps(__m128 src, __mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcompressps

Contiguously store the active single-precision (32-bit) floating-point elements in *a* (those with their respective bit set in writemask *k*) to the return value, and pass through the remaining elements from *src*.

_mm_maskz_compress_ps

```
__m128 _mm_maskz_compress_ps(__mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcompressps

Contiguously store the active single-precision (32-bit) floating-point elements in *a* (those with their respective bit set in zeromask *k*) to the return value, and set the remaining elements to zero.

_mm256_mask_compress_ps

```
__m256 _mm256_mask_compress_ps(__m256 src, __mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcompressps

Contiguously store the active single-precision (32-bit) floating-point elements in *a* (those with their respective bit set in writemask *k*) to the return value, and pass through the remaining elements from *src*.

_mm256_maskz_compress_ps

```
__m256 _mm256_maskz_compress_ps(__mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcompressps

Contiguously store the active single-precision (32-bit) floating-point elements in *a* (those with their respective bit set in zeromask *k*) to the return value, and set the remaining elements to zero.

_mm_mask_expand_pd

```
__m128d _mm_mask_expand_pd(__m128d src, __mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vexpandpd

Load contiguous active double-precision (64-bit) floating-point elements from *a* (those with their respective bit set in mask *k*), and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_expand_pd

```
__m128d _mm_maskz_expand_pd(__mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vexpandpd

Load contiguous active double-precision (64-bit) floating-point elements from *a* (those with their respective bit set in mask *k*), and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_expand_pd

```
__m256d _mm256_mask_expand_pd(__m256d src, __mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vexpandpd

Load contiguous active double-precision (64-bit) floating-point elements from *a* (those with their respective bit set in mask *k*), and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_expand_pd

```
__m256d _mm256_maskz_expand_pd(__mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vexpandpd

Load contiguous active double-precision (64-bit) floating-point elements from *a* (those with their respective bit set in mask *k*), and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_expand_ps

```
__m128 _mm_mask_expand_ps(__m128 src, __mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vexpandps

Load contiguous active single-precision (32-bit) floating-point elements from *a* (those with their respective bit set in mask *k*), and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_expand_ps

```
__m128 _mm_maskz_expand_ps(__mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vexpandps

Load contiguous active single-precision (32-bit) floating-point elements from *a* (those with their respective bit set in mask *k*), and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_expand_ps

```
__m256 _mm256_mask_expand_ps(__m256 src, __mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vexpandps

Load contiguous active single-precision (32-bit) floating-point elements from *a* (those with their respective bit set in mask *k*), and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_expand_ps

```
__m256 _mm256_maskz_expand_ps(__mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vexpandps

Load contiguous active single-precision (32-bit) floating-point elements from *a* (those with their respective bit set in mask *k*), and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_extractf32x4_ps

```
__m128 _mm256_extractf32x4_ps(__m256 a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vextractf32x4

Extract 128 bits (composed of 4 packed single-precision (32-bit) floating-point elements) from *a*, selected with *imm*, and store the result in the return value.

_mm256_mask_extractf32x4_ps

```
__m128 _mm256_mask_extractf32x4_ps(__m128 src, __mmask8 k, __m256 a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vextractf32x4

Extract 128 bits (composed of 4 packed single-precision (32-bit) floating-point elements) from *a*, selected with *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_extractf32x4_ps

```
__m128 _mm256_maskz_extractf32x4_ps(__mmask8 k, __m256 a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vextractf32x4

Extract 128 bits (composed of 4 packed single-precision (32-bit) floating-point elements) from *a*, selected with *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_extractf32x8_ps

```
__m256 _mm512_extractf32x8_ps(__m512 a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vextractf32x8

Extract 256 bits (composed of 8 packed single-precision (32-bit) floating-point elements) from *a*, selected with *imm*, and store the result in the return value.

_mm512_mask_extractf32x8_ps

```
__m256 _mm512_mask_extractf32x8_ps(__m256 src, __mmask8 k, __m512 a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vextractf32x8

Extract 256 bits (composed of 8 packed single-precision (32-bit) floating-point elements) from *a*, selected with *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_extractf32x8_ps

```
__m256 _mm512_maskz_extractf32x8_ps(__mmask8 k, __m512 a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vextractf32x8

Extract 256 bits (composed of 8 packed single-precision (32-bit) floating-point elements) from *a*, selected with *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_extractf64x2_pd

```
__m128d _mm256_extractf64x2_pd(__m256d a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vextractf64x2

Extract 128 bits (composed of 2 packed double-precision (64-bit) floating-point elements) from *a*, selected with *imm*, and store the result in the return value.

_mm256_mask_extractf64x2_pd

```
__m128d _mm256_mask_extractf64x2_pd(__m128d src, __mmask8 k, __m256d a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vextractf64x2

Extract 128 bits (composed of 2 packed double-precision (64-bit) floating-point elements) from *a*, selected with *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_extractf64x2_pd

```
__m128d _mm256_maskz_extractf64x2_pd(__mmask8 k, __m256d a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vextractf64x2

Extract 128 bits (composed of 2 packed double-precision (64-bit) floating-point elements) from *a*, selected with *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_extractf64x2_pd

```
__m128d _mm512_extractf64x2_pd(__m512d a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vextractf64x2

Extract 128 bits (composed of 2 packed double-precision (64-bit) floating-point elements) from *a*, selected with *imm*, and store the result in the return value.

_mm512_mask_extractf64x2_pd

```
__m128d _mm512_mask_extractf64x2_pd(__m128d src, __mmask8 k, __m512d a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vextractf64x2

Extract 128 bits (composed of 2 packed double-precision (64-bit) floating-point elements) from *a*, selected with *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_extractf64x2_pd

```
__m128d _mm512_maskz_extractf64x2_pd(__mmask8 k, __m512d a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vextractf64x2

Extract 128 bits (composed of 2 packed double-precision (64-bit) floating-point elements) from *a*, selected with *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_fixupimm_pd

```
__m128d _mm_fixupimm_pd(__m128d a, __m128d b, __m128i c, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfixupimmpd

Fix up packed double-precision (64-bit) floating-point elements in *a* and *b* using packed 64-bit integers in *c*, and return the results. *imm* is used to set the required flags reporting.

_mm_mask_fixupimm_pd

```
__m128d _mm_mask_fixupimm_pd(__m128d a, __mmask8 k, __m128d b, __m128i c, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfixupimmpd

Fix up packed double-precision (64-bit) floating-point elements in *a* and *b* using packed 64-bit integers in *c*, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set). *imm* is used to set the required flags reporting.

_mm_maskz_fixupimm_pd

```
__m128d _mm_maskz_fixupimm_pd(__mmask8 k, __m128d a, __m128d b, __m128i c, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfixupimmpd

Fix up packed double-precision (64-bit) floating-point elements in *a* and *b* using packed 64-bit integers in *c*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *imm* is used to set the required flags reporting.

_mm256_fixupimm_pd

```
__m256d _mm256_fixupimm_pd(__m256d a, __m256d b, __m256i c, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfixupimmpd

Fix up packed double-precision (64-bit) floating-point elements in *a* and *b* using packed 64-bit integers in *c*, and return the results. *imm* is used to set the required flags reporting.

_mm256_mask_fixupimm_pd

```
__m256d _mm256_mask_fixupimm_pd(__m256d a, __mmask8 k, __m256d b, __m256i c, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfixupimmpd

Fix up packed double-precision (64-bit) floating-point elements in *a* and *b* using packed 64-bit integers in *c*, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set). *imm* is used to set the required flags reporting.

_mm256_maskz_fixupimm_pd

```
__m256d _mm256_maskz_fixupimm_pd(__mmask8 k, __m256d a, __m256d b, __m256i c, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfixupimmpd

Fix up packed double-precision (64-bit) floating-point elements in *a* and *b* using packed 64-bit integers in *c*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *imm* is used to set the required flags reporting.

_mm_fixupimm_ps

```
__m128 _mm_fixupimm_ps(__m128 a, __m128 b, __m128i c, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfixupimmps

Fix up packed single-precision (32-bit) floating-point elements in *a* and *b* using packed 32-bit integers in *c*, and return the results. *imm* is used to set the required flags reporting.

_mm_mask_fixupimm_ps

```
__m128 _mm_mask_fixupimm_ps(__m128 a, __mmask8 k, __m128 b, __m128i c, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfixupimmps

Fix up packed single-precision (32-bit) floating-point elements in *a* and *b* using packed 32-bit integers in *c*, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set). *imm* is used to set the required flags reporting.

_mm_maskz_fixupimm_ps

```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfixupimmps

Fix up packed single-precision (32-bit) floating-point elements in *a* and *b* using packed 32-bit integers in *c*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *imm* is used to set the required flags reporting.

_mm256_fixupimm_ps

```
__m256 _mm256_fixupimm_ps(__m256 a, __m256 b, __m256i c, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfixupimmps

Fix up packed single-precision (32-bit) floating-point elements in *a* and *b* using packed 32-bit integers in *c*, and return the results. *imm* is used to set the required flags reporting.

_mm256_mask_fixupimm_ps

```
__m256 _mm256_mask_fixupimm_ps(__m256 a, __mmask8 k, __m256 b, __m256i c, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfixupimmps

Fix up packed single-precision (32-bit) floating-point elements in *a* and *b* using packed 32-bit integers in *c*, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set). *imm* is used to set the required flags reporting.

_mm256_maskz_fixupimm_ps

```
__m256 _mm256_maskz_fixupimm_ps(__mmask8 k, __m256 a, __m256 b, __m256i c, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vfixupimmps

Fix up packed single-precision (32-bit) floating-point elements in *a* and *b* using packed 32-bit integers in *c*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). *imm* is used to set the required flags reporting.

_mm_getexp_pd

```
__m128d _mm_getexp_pd(__m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetexppd

Convert the exponent of each packed double-precision (64-bit) floating-point element in *a* to a double-precision (64-bit) floating-point number representing the integer exponent, and return the results. This intrinsic essentially calculates *floor(log2(x))* for each element.

_mm_mask_getexp_pd

```
__m128d _mm_mask_getexp_pd(__m128d src, __mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetexppd

Convert the exponent of each packed double-precision (64-bit) floating-point element in *a* to a double-precision (64-bit) floating-point number representing the integer exponent, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). This intrinsic essentially calculates *floor(log2(x))* for each element.

_mm_maskz_getexp_pd

```
__m128d _mm_maskz_getexp_pd(__mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetexppd

Convert the exponent of each packed double-precision (64-bit) floating-point element in *a* to a double-precision (64-bit) floating-point number representing the integer exponent, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). This intrinsic essentially calculates *floor(log2(x))* for each element.

_mm256_getexp_pd

```
__m256d _mm256_getexp_pd(__m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetexppd

Convert the exponent of each packed double-precision (64-bit) floating-point element in *a* to a double-precision (64-bit) floating-point number representing the integer exponent, and return the results. This intrinsic essentially calculates *floor(log2(x))* for each element.

_mm256_mask_getexp_pd

```
__m256d _mm256_mask_getexp_pd(__m256d src, __mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetexppd

Convert the exponent of each packed double-precision (64-bit) floating-point element in *a* to a double-precision (64-bit) floating-point number representing the integer exponent, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). This intrinsic essentially calculates *floor(log2(x))* for each element.

_mm256_maskz_getexp_pd

```
__m256d _mm256_maskz_getexp_pd(__mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetexppd

Convert the exponent of each packed double-precision (64-bit) floating-point element in *a* to a double-precision (64-bit) floating-point number representing the integer exponent, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). This intrinsic essentially calculates *floor(log2(x))* for each element.

_mm_getexp_ps

```
__m128 _mm_getexp_ps(__m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetexpps

Convert the exponent of each packed single-precision (32-bit) floating-point element in *a* to a single-precision (32-bit) floating-point number representing the integer exponent, and return the results. This intrinsic essentially calculates *floor(log2(x))* for each element.

_mm_mask_getexp_ps

```
__m128 _mm_mask_getexp_ps(__m128 src, __mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetexpps

Convert the exponent of each packed single-precision (32-bit) floating-point element in *a* to a single-precision (32-bit) floating-point number representing the integer exponent, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). This intrinsic essentially calculates *floor(log2(x))* for each element.

_mm_maskz_getexp_ps

__m128 _mm_maskz_getexp_ps(__mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetexpps

Convert the exponent of each packed single-precision (32-bit) floating-point element in *a* to a single-precision (32-bit) floating-point number representing the integer exponent, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). This intrinsic essentially calculates *floor(log2(x))* for each element.

_mm256_getexp_ps

```
__m256 _mm256_getexp_ps(__m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetexpps

Convert the exponent of each packed single-precision (32-bit) floating-point element in *a* to a single-precision (32-bit) floating-point number representing the integer exponent, and return the results. This intrinsic essentially calculates *floor(log2(x))* for each element.

_mm256_mask_getexp_ps

```
__m256 _mm256_mask_getexp_ps(__m256 src, __mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetexpps

Convert the exponent of each packed single-precision (32-bit) floating-point element in *a* to a single-precision (32-bit) floating-point number representing the integer exponent, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). This intrinsic essentially calculates *floor(log2(x))* for each element.

_mm256_maskz_getexp_ps

```
__m256 _mm256_maskz_getexp_ps(__mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetexpps

Convert the exponent of each packed single-precision (32-bit) floating-point element in *a* to a single-precision (32-bit) floating-point number representing the integer exponent, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). This intrinsic essentially calculates *floor(log2(x))* for each element.

_mm_getmant_pd

```
__m128d _mm_getmant_pd(__m128d a, _MM_MANTISSA_NORM_ENUM interv, _MM_MANTISSA_SIGN_ENUM sc)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetmantpd

Normalize the mantissas of packed double-precision (64-bit) floating-point elements in *a*, and return the results. This intrinsic essentially calculates ±*(2^k)**|*x.significand*|, where *k* depends on the interval range defined by *interv* and the sign depends on *sc* and the source sign.

_mm_mask_getmant_pd

```
__m128d _mm_mask_getmant_pd(__m128d src, __mmask8 k, __m128d a, _MM_MANTISSA_NORM_ENUM interv,
_MM_MANTISSA_SIGN_ENUM sc)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetmantpd

Normalize the mantissas of packed double-precision (64-bit) floating-point elements in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). This intrinsic essentially calculates ±*(2^k)**|*x.significand*|, where *k* depends on the interval range defined by *interv* and the sign depends on *sc* and the source sign.

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetmantps

Normalize the mantissas of packed single-precision (32-bit) floating-point elements in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). This intrinsic essentially calculates ±*(2^k)**|*x.significand*|, where *k* depends on the interval range defined by *interv* and the sign depends on *sc* and the source sign.

_mm256_getmant_ps

```
__m256 _mm256_getmant_ps(__m256 a, _MM_MANTISSA_NORM_ENUM interv, _MM_MANTISSA_SIGN_ENUM sc)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetmantps

Normalize the mantissas of packed single-precision (32-bit) floating-point elements in *a*, and return the results. This intrinsic essentially calculates ±*(2^k)**|*x.significand*|, where *k* depends on the interval range defined by *interv* and the sign depends on *sc* and the source sign.

_mm256_mask_getmant_ps

```
__m256 _mm256_mask_getmant_ps(__m256 src, __mmask8 k, __m256 a, _MM_MANTISSA_NORM_ENUM interv,
_MM_MANTISSA_SIGN_ENUM sc)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetmantps

Normalize the mantissas of packed single-precision (32-bit) floating-point elements in *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set). This intrinsic essentially calculates ±*(2^k)**|*x.significand*|, where *k* depends on the interval range defined by *interv* and the sign depends on *sc* and the source sign.

_mm256_maskz_getmant_ps

```
__m256 _mm256_maskz_getmant_ps(__mmask8 k, __m256 a, _MM_MANTISSA_NORM_ENUM interv,
_MM_MANTISSA_SIGN_ENUM sc)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vgetmantps

Normalize the mantissas of packed single-precision (32-bit) floating-point elements in *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set). This intrinsic essentially calculates ±*(2^k)**|*x.significand*|, where *k* depends on the interval range defined by *interv* and the sign depends on *sc* and the source sign.

_mm256_insertf32x4

```
__m256 _mm256_insertf32x4(__m256 a, __m128 b, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vinsertf32x4

Copy *a* to the return value, then insert 128 bits (composed of 4 packed single-precision (32-bit) floating-point elements) from *b* into *dst* at the location specified by *imm*.

_mm256_mask_insertf32x4

```
__m256 _mm256_mask_insertf32x4(__m256 src, __mmask8 k, __m256 a, __m128 b, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vinsertf32x4

Copy *a* to *tmp*, then insert 128 bits (composed of 4 packed single-precision (32-bit) floating-point elements) from *b* into *tmp* at the location specified by *imm*. Store *tmp* to the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_insertf32x4

```
__m256 _mm256_maskz_insertf32x4(__mmask8 k, __m256 a, __m128 b, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vinsertf32x4

Copy *a* to *tmp*, then insert 128 bits (composed of 4 packed single-precision (32-bit) floating-point elements) from *b* into *tmp* at the location specified by *imm*. Store *tmp* to the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_insertf32x8

```
__m512 _mm512_insertf32x8(__m512 a, __m256 b, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vinsertf32x8

Copy *a* to the return value, then insert 256 bits (composed of 8 packed single-precision (32-bit) floating-point elements) from *b* into *dst* at the location specified by *imm*.

_mm512_mask_insertf32x8

```
__m512 _mm512_mask_insertf32x8(__m512 src, __mmask16 k, __m512 a, __m256 b, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vinsertf32x8

Copy *a* to *tmp*, then insert 256 bits (composed of 8 packed single-precision (32-bit) floating-point elements) from *b* into *tmp* at the location specified by *imm*. Store *tmp* to the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_insertf32x8

```
__m512 _mm512_maskz_insertf32x8(__mmask16 k, __m512 a, __m256 b, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vinsertf32x8

Copy *a* to *tmp*, then insert 256 bits (composed of 8 packed single-precision (32-bit) floating-point elements) from *b* into *tmp* at the location specified by *imm*. Store *tmp* to the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_insertf64x2

```
__m256d _mm256_insertf64x2(__m256d a, __m128d b, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vinsertf64x2

Copy *a* to the return value, then insert 128 bits (composed of 2 packed double-precision (64-bit) floating-point elements) from *b* into *dst* at the location specified by *imm*.

_mm256_mask_insertf64x2

```
__m256d _mm256_mask_insertf64x2(__m256d src, __mmask8 k, __m256d a, __m128d b, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vinsertf64x2

Copy *a* to *tmp*, then insert 128 bits (composed of 2 packed double-precision (64-bit) floating-point elements) from *b* into *tmp* at the location specified by *imm*. Store *tmp* to the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_insertf64x2

```
__m256d _mm256_maskz_insertf64x2(__mmask8 k, __m256d a, __m128d b, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vinsertf64x2

Copy *a* to *tmp*, then insert 128 bits (composed of 2 packed double-precision (64-bit) floating-point elements) from *b* into *tmp* at the location specified by *imm*. Store *tmp* to the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_insertf64x2

```
__m512d _mm512_insertf64x2(__m512d a, __m128d b, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vinsertf64x2

Copy *a* to the return value, then insert 128 bits (composed of 2 packed double-precision (64-bit) floating-point elements) from *b* into *dst* at the location specified by *imm*.

_mm512_mask_insertf64x2

```
__m512d _mm512_mask_insertf64x2(__m512d src, __mmask8 k, __m512d a, __m128d b, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vinsertf64x2

Copy *a* to *tmp*, then insert 128 bits (composed of 2 packed double-precision (64-bit) floating-point elements) from *b* into *tmp* at the location specified by *imm*. Store *tmp* to the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_insertf64x2

```
__m512d _mm512_maskz_insertf64x2(__mmask8 k, __m512d a, __m128d b, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vinsertf64x2

Copy *a* to *tmp*, then insert 128 bits (composed of 2 packed double-precision (64-bit) floating-point elements) from *b* into *tmp* at the location specified by *imm*. Store *tmp* to the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask2_permutex2var_pd

```
__m128d _mm_mask2_permutex2var_pd(__m128d a, __m128i idx, __mmask8 k, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2pd

Shuffle double-precision (64-bit) floating-point elements in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using writemask *k* (elements are copied from *idx* when the corresponding mask bit is not set)

_mm256_mask2_permutex2var_pd

```
__m256d _mm256_mask2_permutex2var_pd(__m256d a, __m256i idx, __mmask8 k, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2pd

Shuffle double-precision (64-bit) floating-point elements in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using writemask *k* (elements are copied from *idx* when the corresponding mask bit is not set).

_mm_maskz_permutex2var_pd

```
__m128d _mm_maskz_permutex2var_pd(__mmask8 k, __m128d a, __m128i idx, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2pd, vpermt2pd

Shuffle double-precision (64-bit) floating-point elements in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_permutex2var_pd

```
__m128d _mm_permutex2var_pd(__m128d a, __m128i idx, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2pd, vpermt2pd

Shuffle double-precision (64-bit) floating-point elements in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results.

_mm256_maskz_permutex2var_pd

```
__m256d _mm256_maskz_permutex2var_pd(__mmask8 k, __m256d a, __m256i idx, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2pd, vpermt2pd

Shuffle double-precision (64-bit) floating-point elements in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_permutex2var_pd

```
__m256d _mm256_permutex2var_pd(__m256d a, __m256i idx, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2pd, vpermt2pd

Shuffle double-precision (64-bit) floating-point elements in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results.

_mm_mask2_permutex2var_ps

```
__m128 _mm_mask2_permutex2var_ps(__m128 a, __m128i idx, __mmask8 k, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2ps

Shuffle single-precision (32-bit) floating-point elements in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using writemask *k* (elements are copied from *idx* when the corresponding mask bit is not set).

_mm256_mask2_permutex2var_ps

```
__m256 _mm256_mask2_permutex2var_ps(__m256 a, __m256i idx, __mmask8 k, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2ps

Shuffle single-precision (32-bit) floating-point elements in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using writemask *k* (elements are copied from *idx* when the corresponding mask bit is not set).

_mm_maskz_permutex2var_ps

```
__m128 _mm_maskz_permutex2var_ps(__mmask8 k, __m128 a, __m128i idx, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2ps, vpermt2ps

Shuffle single-precision (32-bit) floating-point elements in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_permutex2var_ps

```
__m128 _mm_permutex2var_ps(__m128 a, __m128i idx, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2ps, vpermt2ps

Shuffle single-precision (32-bit) floating-point elements in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results.

_mm256_maskz_permutex2var_ps

```
__m256 _mm256_maskz_permutex2var_ps(__mmask8 k, __m256 a, __m256i idx, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2ps, vpermt2ps

Shuffle single-precision (32-bit) floating-point elements in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_permutex2var_ps

```
__m256 _mm256_permutex2var_ps(__m256 a, __m256i idx, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2ps, vpermt2ps

Shuffle single-precision (32-bit) floating-point elements in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results.

_mm_mask_permute_pd

```
__m128d _mm_mask_permute_pd(__m128d src, __mmask8 k, __m128d a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermilpd

Shuffle double-precision (64-bit) floating-point elements in *a* using the control in *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_mask_permutevar_pd

```
__m128d _mm_mask_permutevar_pd(__m128d src, __mmask8 k, __m128d a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermilpd

Shuffle double-precision (64-bit) floating-point elements in *a* using the control in *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_permute_pd

```
__m128d _mm_maskz_permute_pd(__mmask8 k, __m128d a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermilpd

Shuffle double-precision (64-bit) floating-point elements in *a* using the control in *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_maskz_permutevar_pd

```
__m128d _mm_maskz_permutevar_pd(__mmask8 k, __m128d a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermilpd

Shuffle double-precision (64-bit) floating-point elements in *a* using the control in *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_permute_pd

```
__m256d _mm256_mask_permute_pd(__m256d src, __mmask8 k, __m256d a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermilpd

Shuffle double-precision (64-bit) floating-point elements in *a* within 128-bit lanes using the control in *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_mask_permutevar_pd

```
__m256d _mm256_mask_permutevar_pd(__m256d src, __mmask8 k, __m256d a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermilpd

Shuffle double-precision (64-bit) floating-point elements in *a* within 128-bit lanes using the control in *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_permute_pd

```
__m256d _mm256_maskz_permute_pd(__mmask8 k, __m256d a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermilpd

Shuffle double-precision (64-bit) floating-point elements in *a* within 128-bit lanes using the control in *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_maskz_permutevar_pd

```
__m256d _mm256_maskz_permutevar_pd(__mmask8 k, __m256d a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermilpd

Shuffle double-precision (64-bit) floating-point elements in *a* within 128-bit lanes using the control in *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_permute_ps

```
__m128 _mm_mask_permute_ps(__m128 src, __mmask8 k, __m128 a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermilps

Shuffle single-precision (32-bit) floating-point elements in *a* using the control in *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_mask_permutevar_ps

```
__m128 _mm_mask_permutevar_ps(__m128 src, __mmask8 k, __m128 a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermilps

Shuffle single-precision (32-bit) floating-point elements in *a* using the control in *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_permute_ps

```
__m128 _mm_maskz_permute_ps(__mmask8 k, __m128 a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermilps

Shuffle single-precision (32-bit) floating-point elements in *a* using the control in *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_maskz_permutevar_ps

```
__m128 _mm_maskz_permutevar_ps(__mmask8 k, __m128 a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermilps

Shuffle single-precision (32-bit) floating-point elements in *a* using the control in *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_permute_ps

```
__m256 _mm256_mask_permute_ps(__m256 src, __mmask8 k, __m256 a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermilps

Shuffle single-precision (32-bit) floating-point elements in *a* within 128-bit lanes using the control in *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_mask_permutevar_ps

```
__m256 _mm256_mask_permutevar_ps(__m256 src, __mmask8 k, __m256 a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermilps

Shuffle single-precision (32-bit) floating-point elements in *a* within 128-bit lanes using the control in *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_permute_ps

```
__m256 _mm256_maskz_permute_ps(__mmask8 k, __m256 a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermilps

Shuffle single-precision (32-bit) floating-point elements in *a* within 128-bit lanes using the control in *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_maskz_permutevar_ps

```
__m256 _mm256_maskz_permutevar_ps(__mmask8 k, __m256 a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermilps

Shuffle single-precision (32-bit) floating-point elements in *a* within 128-bit lanes using the control in *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_permutex_pd

```
__m256d _mm256_mask_permutex_pd(__m256d src, __mmask8 k, __m256d a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermpd

Shuffle double-precision (64-bit) floating-point elements in *a* across lanes using the control in *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_mask_permutexvar_pd

```
__m256d _mm256_mask_permutexvar_pd(__m256d src, __mmask8 k, __m256i idx, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermpd

Shuffle double-precision (64-bit) floating-point elements in *a* across lanes using the corresponding index in *idx*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_permutex_pd

```
__m256d _mm256_maskz_permutex_pd(__mmask8 k, __m256d a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermpd

Shuffle double-precision (64-bit) floating-point elements in *a* across lanes using the control in *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_maskz_permutexvar_pd

```
__m256d _mm256_maskz_permutexvar_pd(__mmask8 k, __m256i idx, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermpd

Shuffle double-precision (64-bit) floating-point elements in *a* across lanes using the corresponding index in *idx*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_permutex_pd

```
__m256d _mm256_permutex_pd(__m256d a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermpd

Shuffle double-precision (64-bit) floating-point elements in *a* across lanes using the control in *imm*, and return the results.

_mm256_permutexvar_pd

```
__m256d _mm256_permutexvar_pd(__m256i idx, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermpd

Shuffle double-precision (64-bit) floating-point elements in *a* across lanes using the corresponding index in *idx*, and return the results.

_mm256_mask_permutexvar_ps

```
__m256 _mm256_mask_permutexvar_ps(__m256 src, __mmask8 k, __m256i idx, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermps

Shuffle single-precision (32-bit) floating-point elements in *a* across lanes using the corresponding index in *idx*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_permutexvar_ps

```
__m256 _mm256_maskz_permutexvar_ps(__mmask8 k, __m256i idx, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermps

Shuffle single-precision (32-bit) floating-point elements in *a* across lanes using the corresponding index in *idx*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_permutexvar_ps

```
__m256 _mm256_permutexvar_ps(__m256i idx, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermps

Shuffle single-precision (32-bit) floating-point elements in *a* across lanes using the corresponding index in *idx*.

_mm_mask_permutex2var_pd

```
__m128d _mm_mask_permutex2var_pd(__m128d a, __mmask8 k, __m128i idx, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermt2pd

Shuffle double-precision (64-bit) floating-point elements in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm256_mask_permutex2var_pd

```
__m256d _mm256_mask_permutex2var_pd(__m256d a, __mmask8 k, __m256i idx, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermt2pd

Shuffle double-precision (64-bit) floating-point elements in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm_mask_permutex2var_ps

```
__m128 _mm_mask_permutex2var_ps(__m128 a, __mmask8 k, __m128i idx, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermt2ps

Shuffle single-precision (32-bit) floating-point elements in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm256_mask_permutex2var_ps

```
__m256 _mm256_mask_permutex2var_ps(__m256 a, __mmask8 k, __m256i idx, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermt2ps

Shuffle single-precision (32-bit) floating-point elements in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm_mask_range_pd

```
__m128d _mm_mask_range_pd(__m128d src, __mmask8 k, __m128d a, __m128d b, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vrangepd

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_range_pd

```
__m128d _mm_maskz_range_pd(__mmask8 k, __m128d a, __m128d b, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vrangepd

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_range_pd

```
__m128d _mm_range_pd(__m128d a, __m128d b, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vrangepd

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results.

_mm256_mask_range_pd

```
__m256d _mm256_mask_range_pd(__m256d src, __mmask8 k, __m256d a, __m256d b, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vrangepd

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_range_pd

```
__m256d _mm256_maskz_range_pd(__mmask8 k, __m256d a, __m256d b, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vrangepd

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_range_pd

```
__m256d _mm256_range_pd(__m256d a, __m256d b, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vrangepd

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results.

_mm512_mask_range_pd

```
__m512d _mm512_mask_range_pd(__m512d src, __mmask8 k, __m512d a, __m512d b, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vrangepd

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_mask_range_round_pd

```
__m512d _mm512_mask_range_round_pd(__m512d src, __mmask8 k, __m512d a, __m512d b, int imm, int
rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vrangepd

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_range_pd

```
__m512d _mm512_maskz_range_pd(__mmask8 k, __m512d a, __m512d b, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vrangepd

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_maskz_range_round_pd

```
__m512d _mm512_maskz_range_round_pd(__mmask8 k, __m512d a, __m512d b, int imm, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vrangepd

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_range_pd

```
__m512d _mm512_range_pd(__m512d a, __m512d b, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vrangepd

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results.

_mm512_range_round_pd

```
__m512d _mm512_range_round_pd(__m512d a, __m512d b, int imm, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vrangepd

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed double-precision (64-bit) floating-point elements in *a* and *b*, and return the results.

_mm_mask_range_ps

```
__m128 _mm_mask_range_ps(__m128 src, __mmask8 k, __m128 a, __m128 b, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vrangeps

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_range_ps

```
__m128 _mm_maskz_range_ps(__mmask8 k, __m128 a, __m128 b, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vrangeps

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_range_ps

```
__m128 _mm_range_ps(__m128 a, __m128 b, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vrangeps

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results.

_mm256_mask_range_ps

```
__m256 _mm256_mask_range_ps(__m256 src, __mmask8 k, __m256 a, __m256 b, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vrangeps

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_range_ps

```
__m256 _mm256_maskz_range_ps(__mmask8 k, __m256 a, __m256 b, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vrangeps

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_range_ps

```
__m256 _mm256_range_ps(__m256 a, __m256 b, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vrangeps

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results.

_mm512_mask_range_ps

```
__m512 _mm512_mask_range_ps(__m512 src, __mmask16 k, __m512 a, __m512 b, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vrangeps

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_mask_range_round_ps

```
__m512 _mm512_mask_range_round_ps(__m512 src, __mmask16 k, __m512 a, __m512 b, int imm, int
rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vrangeps

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_range_ps

```
__m512 _mm512_maskz_range_ps(__mmask16 k, __m512 a, __m512 b, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vrangeps

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_maskz_range_round_ps

```
__m512 _mm512_maskz_range_round_ps(__mmask16 k, __m512 a, __m512 b, int imm, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vrangeps

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_range_ps

```
__m512 _mm512_range_ps(__m512 a, __m512 b, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vrangeps

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results.

_mm512_range_round_ps

```
__m512 _mm512_range_round_ps(__m512 a, __m512 b, int imm, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vrangeps

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for packed single-precision (32-bit) floating-point elements in *a* and *b*, and return the results.

_mm_mask_range_round_sd

```
__m128d _mm_mask_range_round_sd(__m128d src, __mmask8 k, __m128d a, __m128d b, int imm, int
rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vrangesd

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for the lower double-precision (64-bit) floating-point element in *a* and *b*, store the result in the lower element of the return value using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copy the upper element from *a* to the upper element of *dst*.

_mm_mask_range_sd

```
__m128d _mm_mask_range_sd(__m128d src, __mmask8 k, __m128d a, __m128d b, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vrangesd

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for the lower double-precision (64-bit) floating-point element in *a* and *b*, store the result in the lower element of the return value using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copy the upper element from *a* to the upper element of *dst*.

_mm_maskz_range_round_sd

```
__m128d _mm_maskz_range_round_sd(__mmask8 k, __m128d a, __m128d b, int imm, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vrangesd

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for the lower double-precision (64-bit) floating-point element in *a* and *b*, store the result in the lower element of the return value using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copy the upper element from *a* to the upper element of *dst*.

_mm_maskz_range_sd

```
__m128d _mm_maskz_range_sd(__mmask8 k, __m128d a, __m128d b, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vrangesd

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for the lower double-precision (64-bit) floating-point element in *a* and *b*, store the result in the lower element of the return value using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copy the upper element from *a* to the upper element of *dst*.

_mm_range_round_sd

```
__m128d _mm_range_round_sd(__m128d a, __m128d b, int imm, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vrangesd

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for the lower double-precision (64-bit) floating-point element in *a* and *b*, store the result in the lower element of the return value, and copy the upper element from *a* to the upper element of *dst*.

_mm_mask_range_round_ss

```
__m128 _mm_mask_range_round_ss(__m128 src, __mmask8 k, __m128 a, __m128 b, int imm, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vrangess

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for the lower single-precision (32-bit) floating-point element in *a* and *b*, store the result in the lower element of the return value using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copy the upper 3 packed elements from *a* to the upper elements of *dst*.

_mm_mask_range_ss

```
__m128 _mm_mask_range_ss(__m128 src, __mmask8 k, __m128 a, __m128 b, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vrangess

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for the lower single-precision (32-bit) floating-point element in *a* and *b*, store the result in the lower element of the return value using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copy the upper 3 packed elements from *a* to the upper elements of *dst*.

_mm_maskz_range_round_ss

```
__m128 _mm_maskz_range_round_ss(__mmask8 k, __m128 a, __m128 b, int imm, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vrangess

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for the lower single-precision (32-bit) floating-point element in *a* and *b*, store the result in the lower element of the return value using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copy the upper 3 packed elements from *a* to the upper elements of *dst*.

_mm_maskz_range_ss

```
__m128 _mm_maskz_range_ss(__mmask8 k, __m128 a, __m128 b, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vrangess

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for the lower single-precision (32-bit) floating-point element in *a* and *b*, store the result in the lower element of the return value using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copy the upper 3 packed elements from *a* to the upper elements of *dst*.

_mm_range_round_ss

```
__m128 _mm_range_round_ss(__m128 a, __m128 b, int imm, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vrangess

Calculate the max, min, absolute max, or absolute min (depending on control in *imm*) for the lower single-precision (32-bit) floating-point element in *a* and *b*, store the result in the lower element of the return value, and copy the upper 3 packed elements from *a* to the upper elements of *dst*.

_mm_mask_reduce_pd

```
__m128d _mm_mask_reduce_pd(__m128d src, __mmask8 k, __m128d a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vreducepd

Extract the reduced argument of packed double-precision (64-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_reduce_pd

```
__m128d _mm_maskz_reduce_pd(__mmask8 k, __m128d a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vreducepd

Extract the reduced argument of packed double-precision (64-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_reduce_pd

```
__m128d _mm_reduce_pd(__m128d a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vreducepd

Extract the reduced argument of packed double-precision (64-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results.

_mm256_mask_reduce_pd

```
__m256d _mm256_mask_reduce_pd(__m256d src, __mmask8 k, __m256d a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vreducepd

Extract the reduced argument of packed double-precision (64-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_reduce_pd

```
__m256d _mm256_maskz_reduce_pd(__mmask8 k, __m256d a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vreducepd

Extract the reduced argument of packed double-precision (64-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_reduce_pd

```
__m256d _mm256_reduce_pd(__m256d a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vreducepd

Extract the reduced argument of packed double-precision (64-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results.

_mm512_mask_reduce_pd

```
__m512d _mm512_mask_reduce_pd(__m512d src, __mmask8 k, __m512d a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vreducepd

Extract the reduced argument of packed double-precision (64-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_mask_reduce_round_pd

```
__m512d _mm512_mask_reduce_round_pd(__m512d src, __mmask8 k, __m512d a, int imm, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vreducepd

Extract the reduced argument of packed double-precision (64-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_reduce_pd

```
__m512d _mm512_maskz_reduce_pd(__mmask8 k, __m512d a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vreducepd

Extract the reduced argument of packed double-precision (64-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_maskz_reduce_round_pd

```
__m512d _mm512_maskz_reduce_round_pd(__mmask8 k, __m512d a, int imm, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vreducepd

Extract the reduced argument of packed double-precision (64-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_reduce_pd

```
__m512d _mm512_reduce_pd(__m512d a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vreducepd

Extract the reduced argument of packed double-precision (64-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results.

_mm512_reduce_round_pd

```
__m512d _mm512_reduce_round_pd(__m512d a, int imm, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vreducepd

Extract the reduced argument of packed double-precision (64-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results.

_mm_mask_reduce_ps

```
__m128 _mm_mask_reduce_ps(__m128 src, __mmask8 k, __m128 a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vreduceps

Extract the reduced argument of packed single-precision (32-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_reduce_ps

```
__m128 _mm_maskz_reduce_ps(__mmask8 k, __m128 a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vreduceps

Extract the reduced argument of packed single-precision (32-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_reduce_ps

```
__m128 _mm_reduce_ps(__m128 a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vreduceps

Extract the reduced argument of packed single-precision (32-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results.

_mm256_mask_reduce_ps

```
__m256 _mm256_mask_reduce_ps(__m256 src, __mmask8 k, __m256 a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vreduceps

Extract the reduced argument of packed single-precision (32-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_reduce_ps

```
__m256 _mm256_maskz_reduce_ps(__mmask8 k, __m256 a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vreduceps

Extract the reduced argument of packed single-precision (32-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_reduce_ps

```
__m256 _mm256_reduce_ps(__m256 a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vreduceps

Extract the reduced argument of packed single-precision (32-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results.

_mm512_mask_reduce_ps

```
__m512 _mm512_mask_reduce_ps(__m512 src, __mmask16 k, __m512 a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vreduceps

Extract the reduced argument of packed single-precision (32-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_mask_reduce_round_ps

```
__m512 _mm512_mask_reduce_round_ps(__m512 src, __mmask16 k, __m512 a, int imm, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vreduceps

Extract the reduced argument of packed single-precision (32-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_reduce_ps

```
__m512 _mm512_maskz_reduce_ps(__mmask16 k, __m512 a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vreduceps

Extract the reduced argument of packed single-precision (32-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_maskz_reduce_round_ps

```
__m512 _mm512_maskz_reduce_round_ps(__mmask16 k, __m512 a, int imm, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vreduceps

Extract the reduced argument of packed single-precision (32-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_reduce_ps

```
__m512 _mm512_reduce_ps(__m512 a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vreduceps

Extract the reduced argument of packed single-precision (32-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results.

_mm512_reduce_round_ps

```
__m512 _mm512_reduce_round_ps(__m512 a, int imm, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vreduceps

Extract the reduced argument of packed single-precision (32-bit) floating-point elements in *a* by the number of bits specified by *imm*, and return the results.

_mm_mask_reduce_round_sd

```
__m128d _mm_mask_reduce_round_sd(__m128d src, __mmask8 k, __m128d a, __m128d b, int imm, int
rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vreducesd

Extract the reduced argument of the lower double-precision (64-bit) floating-point element in *a* by the number of bits specified by *imm*, store the result in the lower element of the return value using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copy the upper element from *b* to the upper element of *dst*.

_mm_mask_reduce_sd

```
__m128d _mm_mask_reduce_sd(__m128d src, __mmask8 k, __m128d a, __m128d b, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vreducesd

Extract the reduced argument of the lower double-precision (64-bit) floating-point element in *a* by the number of bits specified by *imm*, store the result in the lower element of the return value using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copy the upper element from *b* to the upper element of *dst*.

_mm_maskz_reduce_round_sd

```
__m128d _mm_maskz_reduce_round_sd(__mmask8 k, __m128d a, __m128d b, int imm, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vreducesd

Extract the reduced argument of the lower double-precision (64-bit) floating-point element in *a* by the number of bits specified by *imm*, store the result in the lower element of the return value using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copy the upper element from *b* to the upper element of *dst*.

_mm_maskz_reduce_sd

```
__m128d _mm_maskz_reduce_sd(__mmask8 k, __m128d a, __m128d b, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vreducesd

Extract the reduced argument of the lower double-precision (64-bit) floating-point element in *a* by the number of bits specified by *imm*, store the result in the lower element of the return value using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copy the upper element from *b* to the upper element of *dst*.

_mm_reduce_round_sd

```
__m128d _mm_reduce_round_sd(__m128d a, __m128d b, int imm, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vreducesd

Extract the reduced argument of the lower double-precision (64-bit) floating-point element in *a* by the number of bits specified by *imm*, store the result in the lower element of the return value, and copy the upper element from *b* to the upper element of *dst*.

_mm_reduce_sd

```
__m128d _mm_reduce_sd(__m128d a, __m128d b, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vreducesd

Extract the reduced argument of the lower double-precision (64-bit) floating-point element in *a* by the number of bits specified by *imm*, store the result in the lower element of the return value, and copy the upper element from *b* to the upper element of *dst*.

_mm_mask_reduce_round_ss

```
__m128 _mm_mask_reduce_round_ss(__m128 src, __mmask8 k, __m128 a, __m128 b, int imm, int
rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vreducess

Extract the reduced argument of the lower single-precision (32-bit) floating-point element in *a* by the number of bits specified by *imm*, store the result in the lower element of the return value using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copy the upper 3 packed elements from *b* to the upper elements of *dst*.

_mm_mask_reduce_ss

```
__m128 _mm_mask_reduce_ss(__m128 src, __mmask8 k, __m128 a, __m128 b, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vreducess

Extract the reduced argument of the lower single-precision (32-bit) floating-point element in *a* by the number of bits specified by *imm*, store the result in the lower element of the return value using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copy the upper 3 packed elements from *b* to the upper elements of *dst*.

_mm_maskz_reduce_round_ss

```
__m128 _mm_maskz_reduce_round_ss(__mmask8 k, __m128 a, __m128 b, int imm, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vreducess

Extract the reduced argument of the lower single-precision (32-bit) floating-point element in *a* by the number of bits specified by *imm*, store the result in the lower element of the return value using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copy the upper 3 packed elements from *b* to the upper elements of *dst*.

_mm_maskz_reduce_ss

```
__m128 _mm_maskz_reduce_ss(__mmask8 k, __m128 a, __m128 b, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vreducess

Extract the reduced argument of the lower single-precision (32-bit) floating-point element in *a* by the number of bits specified by *imm*, store the result in the lower element of the return value using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copy the upper 3 packed elements from *b* to the upper elements of *dst*.

_mm_reduce_round_ss

```
__m128 _mm_reduce_round_ss(__m128 a, __m128 b, int imm, int rounding)
```

CPUID Flags: AVX512DQ

Instruction(s): vreducess

Extract the reduced argument of the lower single-precision (32-bit) floating-point element in *a* by the number of bits specified by *imm*, store the result in the lower element of the return value, and copy the upper 3 packed elements from *b* to the upper elements of *dst*.

_mm_reduce_ss

```
__m128 _mm_reduce_ss(__m128 a, __m128 b, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vreducess

Extract the reduced argument of the lower single-precision (32-bit) floating-point element in *a* by the number of bits specified by *imm*, store the result in the lower element of the return value, and copy the upper 3 packed elements from *b* to the upper elements of *dst*.

_mm_mask_roundscale_pd

```
__m128d _mm_mask_roundscale_pd(__m128d src, __mmask8 k, __m128d a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrndscalepd

Round packed double-precision (64-bit) floating-point elements in *a* to the number of fraction bits specified by *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_roundscale_pd

```
__m128d _mm_maskz_roundscale_pd(__mmask8 k, __m128d a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrndscalepd

Round packed double-precision (64-bit) floating-point elements in *a* to the number of fraction bits specified by *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_roundscale_pd

```
__m128d _mm_roundscale_pd(__m128d a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrndscalepd

Round packed double-precision (64-bit) floating-point elements in *a* to the number of fraction bits specified by *imm*, and return the results.

_mm256_mask_roundscale_pd

```
__m256d _mm256_mask_roundscale_pd(__m256d src, __mmask8 k, __m256d a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrndscalepd

Round packed double-precision (64-bit) floating-point elements in *a* to the number of fraction bits specified by *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_roundscale_pd

```
__m256d _mm256_maskz_roundscale_pd(__mmask8 k, __m256d a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrndscalepd

Round packed double-precision (64-bit) floating-point elements in *a* to the number of fraction bits specified by *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_roundscale_pd

```
__m256d _mm256_roundscale_pd(__m256d a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrndscalepd

Round packed double-precision (64-bit) floating-point elements in *a* to the number of fraction bits specified by *imm*, and return the results.

_mm_mask_roundscale_ps

```
__m128 _mm_mask_roundscale_ps(__m128 src, __mmask8 k, __m128 a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrndscaleps

Round packed single-precision (32-bit) floating-point elements in *a* to the number of fraction bits specified by *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_roundscale_ps

```
__m128 _mm_maskz_roundscale_ps(__mmask8 k, __m128 a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrndscaleps

Round packed single-precision (32-bit) floating-point elements in *a* to the number of fraction bits specified by *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_roundscale_ps

```
__m128 _mm_roundscale_ps(__m128 a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrndscaleps

Round packed single-precision (32-bit) floating-point elements in *a* to the number of fraction bits specified by *imm*, and return the results.

_mm256_mask_roundscale_ps

```
__m256 _mm256_mask_roundscale_ps(__m256 src, __mmask8 k, __m256 a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrndscaleps

Round packed single-precision (32-bit) floating-point elements in *a* to the number of fraction bits specified by *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_roundscale_ps

```
__m256 _mm256_maskz_roundscale_ps(__mmask8 k, __m256 a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrndscaleps

Round packed single-precision (32-bit) floating-point elements in *a* to the number of fraction bits specified by *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_roundscale_ps

```
__m256 _mm256_roundscale_ps(__m256 a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vrndscaleps

Round packed single-precision (32-bit) floating-point elements in *a* to the number of fraction bits specified by *imm*, and return the results.

_mm_mask_scalef_pd

```
__m128d _mm_mask_scalef_pd(__m128d src, __mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscalefpd

Scale the packed double-precision (64-bit) floating-point elements in *a* using values from *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_scalef_pd

```
__m128d _mm_maskz_scalef_pd(__mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscalefpd

Scale the packed double-precision (64-bit) floating-point elements in *a* using values from *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_scalef_pd

```
__m128d _mm_scalef_pd(__m128d a, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscalefpd

Scale the packed double-precision (64-bit) floating-point elements in *a* using values from *b*, and return the results.

_mm256_mask_scalef_pd

```
__m256d _mm256_mask_scalef_pd(__m256d src, __mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscalefpd

Scale the packed double-precision (64-bit) floating-point elements in *a* using values from *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_scalef_pd

```
__m256d _mm256_maskz_scalef_pd(__mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscalefpd

Scale the packed double-precision (64-bit) floating-point elements in *a* using values from *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_scalef_pd

```
__m256d _mm256_scalef_pd(__m256d a, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscalefpd

Scale the packed double-precision (64-bit) floating-point elements in *a* using values from *b*, and return the results.

_mm_mask_scalef_ps

```
__m128 _mm_mask_scalef_ps(__m128 src, __mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscalefps

Scale the packed single-precision (32-bit) floating-point elements in *a* using values from *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_scalef_ps

```
__m128 _mm_maskz_scalef_ps(__mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscalefps

Scale the packed single-precision (32-bit) floating-point elements in *a* using values from *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_scalef_ps

```
__m128 _mm_scalef_ps(__m128 a, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscalefps

Scale the packed single-precision (32-bit) floating-point elements in *a* using values from *b*, and return the results.

_mm256_mask_scalef_ps

```
__m256 _mm256_mask_scalef_ps(__m256 src, __mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscalefps

Scale the packed single-precision (32-bit) floating-point elements in *a* using values from *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_scalef_ps

```
__m256 _mm256_maskz_scalef_ps(__mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscalefps

Scale the packed single-precision (32-bit) floating-point elements in *a* using values from *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_scalef_ps

```
__m256 _mm256_scalef_ps(__m256 a, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscalefps

Scale the packed single-precision (32-bit) floating-point elements in *a* using values from *b*, and return the results.

_mm256_mask_shuffle_f32x4

```
__m256 _mm256_mask_shuffle_f32x4(__m256 src, __mmask8 k, __m256 a, __m256 b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vshuff32x4

Shuffle 128-bits (composed of 4 single-precision (32-bit) floating-point elements) selected by *imm* from *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_shuffle_f32x4

```
__m256 _mm256_maskz_shuffle_f32x4(__mmask8 k, __m256 a, __m256 b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vshuff32x4

Shuffle 128-bits (composed of 4 single-precision (32-bit) floating-point elements) selected by *imm* from *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_shuffle_f32x4

```
__m256 _mm256_shuffle_f32x4(__m256 a, __m256 b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vshuff32x4

Shuffle 128-bits (composed of 4 single-precision (32-bit) floating-point elements) selected by *imm* from *a* and *b*, and return the results.

_mm256_mask_shuffle_f64x2

```
__m256d _mm256_mask_shuffle_f64x2(__m256d src, __mmask8 k, __m256d a, __m256d b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vshuff64x2

Shuffle 128-bits (composed of 2 double-precision (64-bit) floating-point elements) selected by *imm* from *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_shuffle_f64x2

```
__m256d _mm256_maskz_shuffle_f64x2(__mmask8 k, __m256d a, __m256d b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vshuff64x2

Shuffle 128-bits (composed of 2 double-precision (64-bit) floating-point elements) selected by *imm* from *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_shuffle_f64x2

```
__m256d _mm256_shuffle_f64x2(__m256d a, __m256d b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vshuff64x2

Shuffle 128-bits (composed of 2 double-precision (64-bit) floating-point elements) selected by *imm* from *a* and *b*, and return the results.

_mm_mask_shuffle_pd

```
__m128d _mm_mask_shuffle_pd(__m128d src, __mmask8 k, __m128d a, __m128d b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vshufpd

Shuffle double-precision (64-bit) floating-point elements using the control in *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_shuffle_pd

```
__m128d _mm_maskz_shuffle_pd(__mmask8 k, __m128d a, __m128d b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vshufpd

Shuffle double-precision (64-bit) floating-point elements using the control in *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_shuffle_pd

```
__m256d _mm256_mask_shuffle_pd(__m256d src, __mmask8 k, __m256d a, __m256d b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vshufpd

Shuffle double-precision (64-bit) floating-point elements within 128-bit lanes using the control in *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_shuffle_pd

```
__m256d _mm256_maskz_shuffle_pd(__mmask8 k, __m256d a, __m256d b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vshufpd

Shuffle double-precision (64-bit) floating-point elements within 128-bit lanes using the control in *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_shuffle_ps

```
__m128 _mm_mask_shuffle_ps(__m128 src, __mmask8 k, __m128 a, __m128 b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vshufps

Shuffle single-precision (32-bit) floating-point elements in *a* using the control in *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_shuffle_ps

```
__m128 _mm_maskz_shuffle_ps(__mmask8 k, __m128 a, __m128 b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vshufps

Shuffle single-precision (32-bit) floating-point elements in *a* using the control in *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_shuffle_ps

```
__m256 _mm256_mask_shuffle_ps(__m256 src, __mmask8 k, __m256 a, __m256 b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vshufps

Shuffle single-precision (32-bit) floating-point elements in *a* within 128-bit lanes using the control in *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_shuffle_ps

```
__m256 _mm256_maskz_shuffle_ps(__mmask8 k, __m256 a, __m256 b, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vshufps

Shuffle single-precision (32-bit) floating-point elements in *a* within 128-bit lanes using the control in *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_unpackhi_pd

```
__m128d _mm_mask_unpackhi_pd(__m128d src, __mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vunpckhpd

Unpack and interleave double-precision (64-bit) floating-point elements from the high half of *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_unpackhi_pd

```
__m128d _mm_maskz_unpackhi_pd(__mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vunpckhpd

Unpack and interleave double-precision (64-bit) floating-point elements from the high half of *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_unpackhi_pd

```
__m256d _mm256_mask_unpackhi_pd(__m256d src, __mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vunpckhpd

Unpack and interleave double-precision (64-bit) floating-point elements from the high half of each 128-bit lane in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_unpackhi_pd

```
__m256d _mm256_maskz_unpackhi_pd(__mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vunpckhpd

Unpack and interleave double-precision (64-bit) floating-point elements from the high half of each 128-bit lane in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_unpackhi_ps

```
__m128 _mm_mask_unpackhi_ps(__m128 src, __mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vunpckhps

Unpack and interleave single-precision (32-bit) floating-point elements from the high half of *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_unpackhi_ps

```
__m128 _mm_maskz_unpackhi_ps(__mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vunpckhps

Unpack and interleave single-precision (32-bit) floating-point elements from the high half of *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_unpackhi_ps

```
__m256 _mm256_mask_unpackhi_ps(__m256 src, __mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vunpckhps

Unpack and interleave single-precision (32-bit) floating-point elements from the high half of each 128-bit lane in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_unpackhi_ps

```
__m256 _mm256_maskz_unpackhi_ps(__mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vunpckhps

Unpack and interleave single-precision (32-bit) floating-point elements from the high half of each 128-bit lane in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_unpacklo_pd

```
__m128d _mm_mask_unpacklo_pd(__m128d src, __mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vunpcklpd

Unpack and interleave double-precision (64-bit) floating-point elements from the low half of *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_unpacklo_pd

```
__m128d _mm_maskz_unpacklo_pd(__mmask8 k, __m128d a, __m128d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vunpcklpd

Unpack and interleave double-precision (64-bit) floating-point elements from the low half of *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_unpacklo_pd

```
__m256d _mm256_mask_unpacklo_pd(__m256d src, __mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vunpcklpd

Unpack and interleave double-precision (64-bit) floating-point elements from the low half of each 128-bit lane in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_unpacklo_pd

```
__m256d _mm256_maskz_unpacklo_pd(__mmask8 k, __m256d a, __m256d b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vunpcklpd

Unpack and interleave double-precision (64-bit) floating-point elements from the low half of each 128-bit lane in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_unpacklo_ps

```
__m128 _mm_mask_unpacklo_ps(__m128 src, __mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vunpcklps

Unpack and interleave single-precision (32-bit) floating-point elements from the low half of *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_unpacklo_ps

```
__m128 _mm_maskz_unpacklo_ps(__mmask8 k, __m128 a, __m128 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vunpcklps

Unpack and interleave single-precision (32-bit) floating-point elements from the low half of *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_unpacklo_ps

```
__m256 _mm256_mask_unpacklo_ps(__m256 src, __mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vunpcklps

Unpack and interleave single-precision (32-bit) floating-point elements from the low half of each 128-bit lane in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_unpacklo_ps

```
__m256 _mm256_maskz_unpacklo_ps(__mmask8 k, __m256 a, __m256 b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vunpcklps

Unpack and interleave single-precision (32-bit) floating-point elements from the low half of each 128-bit lane in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_alignr_epi32

```
__m128i _mm_alignr_epi32(__m128i a, __m128i b, const int count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): valignd

Concatenate *a* and *b* into a 32-byte immediate result, shift the result right by *count* 32-bit elements, and store the low 16 bytes (4 elements) in the return value.

_mm_mask_alignr_epi32

```
__m128i _mm_mask_alignr_epi32(__m128i src, __mmask8 k, __m128i a, __m128i b, const int count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): valignd

Concatenate *a* and *b* into a 32-byte immediate result, shift the result right by *count* 32-bit elements, and store the low 16 bytes (4 elements) in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_alignr_epi32

```
__m128i _mm_maskz_alignr_epi32(__mmask8 k, __m128i a, __m128i b, const int count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): valignd

Concatenate *a* and *b* into a 32-byte immediate result, shift the result right by *count* 32-bit elements, and store the low 16 bytes (4 elements) in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_alignr_epi32

```
__m256i _mm256_alignr_epi32(__m256i a, __m256i b, const int count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): valignd

Concatenate *a* and *b* into a 64-byte immediate result, shift the result right by *count* 32-bit elements, and store the low 32 bytes (8 elements) in the return value.

_mm256_mask_alignr_epi32

```
__m256i _mm256_mask_alignr_epi32(__m256i src, __mmask8 k, __m256i a, __m256i b, const int count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): valignd

Concatenate *a* and *b* into a 64-byte immediate result, shift the result right by *count* 32-bit elements, and store the low 32 bytes (8 elements) in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_alignr_epi32

```
__m256i _mm256_maskz_alignr_epi32(__mmask8 k, __m256i a, __m256i b, const int count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): valignd

Concatenate *a* and *b* into a 64-byte immediate result, shift the result right by *count* 32-bit elements, and store the low 32 bytes (8 elements) in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_alignr_epi64

```
__m128i _mm_alignr_epi64(__m128i a, __m128i b, const int count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): valignq

Concatenate *a* and *b* into a 32-byte immediate result, shift the result right by *count* 64-bit elements, and store the low 16 bytes (2 elements) in the return value.

_mm_mask_alignr_epi64

```
__m128i _mm_mask_alignr_epi64(__m128i src, __mmask8 k, __m128i a, __m128i b, const int count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): valignq

Concatenate *a* and *b* into a 32-byte immediate result, shift the result right by *count* 64-bit elements, and store the low 16 bytes (2 elements) in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_alignr_epi64

```
__m128i _mm_maskz_alignr_epi64(__mmask8 k, __m128i a, __m128i b, const int count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): valignq

Concatenate *a* and *b* into a 32-byte immediate result, shift the result right by *count* 64-bit elements, and store the low 16 bytes (2 elements) in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_alignr_epi64

```
__m256i _mm256_alignr_epi64(__m256i a, __m256i b, const int count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): valignq

Concatenate *a* and *b* into a 64-byte immediate result, shift the result right by *count* 64-bit elements, and store the low 32 bytes (4 elements) in the return value.

_mm256_mask_alignr_epi64

```
__m256i _mm256_mask_alignr_epi64(__m256i src, __mmask8 k, __m256i a, __m256i b, const int count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): valignq

Concatenate *a* and *b* into a 64-byte immediate result, shift the result right by *count* 64-bit elements, and store the low 32 bytes (4 elements) in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_alignr_epi64

```
__m256i _mm256_maskz_alignr_epi64(__mmask8 k, __m256i a, __m256i b, const int count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): valignq

Concatenate *a* and *b* into a 64-byte immediate result, shift the result right by *count* 64-bit elements, and store the low 32 bytes (4 elements) in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_dbsad_epu8

```
__m128i _mm_dbsad_epu8(__m128i a, __m128i b, int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vdbpsadbw

Compute the sum of absolute differences (SADs) of quadruplets of unsigned 8-bit integers in *a* compared to those in *b*, and store the 16-bit results in the return value.

_mm_mask_dbsad_epu8

```
__m128i _mm_mask_dbsad_epu8(__m128i src, __mmask8 k, __m128i a, __m128i b, int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vdbpsadbw

Compute the sum of absolute differences (SADs) of quadruplets of unsigned 8-bit integers in *a* compared to those in *b*, and store the 16-bit results in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_dbsad_epu8

```
__m128i _mm_maskz_dbsad_epu8(__mmask8 k, __m128i a, __m128i b, int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vdbpsadbw

Compute the sum of absolute differences (SADs) of quadruplets of unsigned 8-bit integers in *a* compared to those in *b*, and store the 16-bit results in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_dbsad_epu8

```
__m256i _mm256_dbsad_epu8(__m256i a, __m256i b, int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vdbpsadbw

Compute the sum of absolute differences (SADs) of quadruplets of unsigned 8-bit integers in *a* compared to those in *b*, and store the 16-bit results in the return value.

_mm256_mask_dbsad_epu8

```
__m256i _mm256_mask_dbsad_epu8(__m256i src, __mmask16 k, __m256i a, __m256i b, int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vdbpsadbw

Compute the sum of absolute differences (SADs) of quadruplets of unsigned 8-bit integers in *a* compared to those in *b*, and store the 16-bit results in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_dbsad_epu8

```
__m256i _mm256_maskz_dbsad_epu8(__mmask16 k, __m256i a, __m256i b, int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vdbpsadbw

Compute the sum of absolute differences (SADs) of quadruplets of unsigned 8-bit integers in *a* compared to those in *b*, and store the 16-bit results in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_dbsad_epu8

```
__m512i _mm512_dbsad_epu8(__m512i a, __m512i b, int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vdbpsadbw

Compute the sum of absolute differences (SADs) of quadruplets of unsigned 8-bit integers in *a* compared to those in *b*, and store the 16-bit results in the return value.

_mm512_mask_dbsad_epu8

```
__m512i _mm512_mask_dbsad_epu8(__m512i src, __mmask32 k, __m512i a, __m512i b, int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vdbpsadbw

Compute the sum of absolute differences (SADs) of quadruplets of unsigned 8-bit integers in *a* compared to those in *b*, and store the 16-bit results in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_dbsad_epu8

```
__m512i _mm512_maskz_dbsad_epu8(__mmask32 k, __m512i a, __m512i b, int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vdbpsadbw

Compute the sum of absolute differences (SADs) of quadruplets of unsigned 8-bit integers in *a* compared to those in *b*, and store the 16-bit results in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_extracti32x4_epi32

```
__m128i _mm256_extracti32x4_epi32(__m256i a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vextracti32x4

Extract 128 bits (composed of 4 packed 32-bit integers) from *a*, selected with *imm*, and store the result in the return value.

_mm256_mask_extracti32x4_epi32

```
__m128i _mm256_mask_extracti32x4_epi32(__m128i src, __mmask8 k, __m256i a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vextracti32x4

Extract 128 bits (composed of 4 packed 32-bit integers) from *a*, selected with *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_extracti32x4_epi32

```
__m128i _mm256_maskz_extracti32x4_epi32(__mmask8 k, __m256i a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vextracti32x4

Extract 128 bits (composed of 4 packed 32-bit integers) from *a*, selected with *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_extracti32x8_epi32

```
__m256i _mm512_extracti32x8_epi32(__m512i a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vextracti32x8

Extract 256 bits (composed of 8 packed 32-bit integers) from *a*, selected with *imm*, and store the result in the return value.

_mm512_mask_extracti32x8_epi32

```
__m256i _mm512_mask_extracti32x8_epi32(__m256i src, __mmask8 k, __m512i a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vextracti32x8

Extract 256 bits (composed of 8 packed 32-bit integers) from *a*, selected with *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_extracti32x8_epi32

```
__m256i _mm512_maskz_extracti32x8_epi32(__mmask8 k, __m512i a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vextracti32x8

Extract 256 bits (composed of 8 packed 32-bit integers) from *a*, selected with *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_extracti64x2_epi64

```
__m128i _mm256_extracti64x2_epi64(__m256i a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vextracti64x2

Extract 128 bits (composed of 2 packed 64-bit integers) from *a*, selected with *imm*, and store the result in the return value.

_mm256_mask_extracti64x2_epi64

```
__m128i _mm256_mask_extracti64x2_epi64(__m128i src, __mmask8 k, __m256i a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vextracti64x2

Extract 128 bits (composed of 2 packed 64-bit integers) from *a*, selected with *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_extracti64x2_epi64

```
__m128i _mm256_maskz_extracti64x2_epi64(__mmask8 k, __m256i a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vextracti64x2

Extract 128 bits (composed of 2 packed 64-bit integers) from *a*, selected with *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_extracti64x2_epi64

```
__m128i _mm512_extracti64x2_epi64(__m512i a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vextracti64x2

Extract 128 bits (composed of 2 packed 64-bit integers) from *a*, selected with *imm*, and store the result in the return value.

_mm512_mask_extracti64x2_epi64

```
__m128i _mm512_mask_extracti64x2_epi64(__m128i src, __mmask8 k, __m512i a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vextracti64x2

Extract 128 bits (composed of 2 packed 64-bit integers) from *a*, selected with *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_extracti64x2_epi64

```
__m128i _mm512_maskz_extracti64x2_epi64(__mmask8 k, __m512i a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vextracti64x2

Extract 128 bits (composed of 2 packed 64-bit integers) from *a*, selected with *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_alignr_epi8

```
__m128i _mm_mask_alignr_epi8(__m128i src, __mmask16 k, __m128i a, __m128i b, const int count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpalignr

Concatenate pairs of 16-byte blocks in *a* and *b* into a 32-byte temporary result, shift the result right by *count* bytes, and store the low 16 bytes in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_alignr_epi8

```
__m128i _mm_maskz_alignr_epi8(__mmask16 k, __m128i a, __m128i b, const int count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpalignr

Concatenate pairs of 16-byte blocks in *a* and *b* into a 32-byte temporary result, shift the result right by *count* bytes, and store the low 16 bytes in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_alignr_epi8

```
__m256i _mm256_mask_alignr_epi8(__m256i src, __mmask32 k, __m256i a, __m256i b, const int count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpalignr

Concatenate pairs of 16-byte blocks in *a* and *b* into a 32-byte temporary result, shift the result right by *count* bytes, and store the low 16 bytes in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_alignr_epi8

```
__m256i _mm256_maskz_alignr_epi8(__mmask32 k, __m256i a, __m256i b, const int count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpalignr

Concatenate pairs of 16-byte blocks in *a* and *b* into a 32-byte temporary result, shift the result right by *count* bytes, and store the low 16 bytes in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_alignr_epi8

```
__m512i _mm512_alignr_epi8(__m512i a, __m512i b, const int count)
```

CPUID Flags: AVX512BW

Instruction(s): vpalignr

Concatenate pairs of 16-byte blocks in *a* and *b* into a 32-byte temporary result, shift the result right by *count* bytes, and store the low 16 bytes in the return value.

_mm512_mask_alignr_epi8

```
__m512i _mm512_mask_alignr_epi8(__m512i src, __mmask64 k, __m512i a, __m512i b, const int count)
```

CPUID Flags: AVX512BW

Instruction(s): vpalignr

Concatenate pairs of 16-byte blocks in *a* and *b* into a 32-byte temporary result, shift the result right by *count* bytes, and store the low 16 bytes in the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_alignr_epi8

```
__m512i _mm512_maskz_alignr_epi8(__mmask64 k, __m512i a, __m512i b, const int count)
```

CPUID Flags: AVX512BW

Instruction(s): vpalignr

Concatenate pairs of 16-byte blocks in *a* and *b* into a 32-byte temporary result, shift the result right by *count* bytes, and store the low 16 bytes in the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_blend_epi8

```
__m128i _mm_mask_blend_epi8(__mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpblendmb

Blend packed 8-bit integers from *a* and *b* using control mask *k*, and return the results.

_mm256_mask_blend_epi8

```
__m256i _mm256_mask_blend_epi8(__mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpblendmb

Blend packed 8-bit integers from *a* and *b* using control mask *k*, and return the results.

_mm512_mask_blend_epi8

```
__m512i _mm512_mask_blend_epi8(__mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpblendmb

Blend packed 8-bit integers from *a* and *b* using control mask *k*, and return the results.

_mm_mask_blend_epi32

```
__m128i _mm_mask_blend_epi32(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpblendmd

Blend packed 32-bit integers from *a* and *b* using control mask *k*, and return the results.

_mm256_mask_blend_epi32

```
__m256i _mm256_mask_blend_epi32(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpblendmd

Blend packed 32-bit integers from *a* and *b* using control mask *k*, and return the results.

_mm_mask_blend_epi64

```
__m128i _mm_mask_blend_epi64(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpblendmq

Blend packed 64-bit integers from *a* and *b* using control mask *k*, and return the results.

_mm256_mask_blend_epi64

```
__m256i _mm256_mask_blend_epi64(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpblendmq

Blend packed 64-bit integers from *a* and *b* using control mask *k*, and return the results.

_mm_mask_blend_epi16

```
__m128i _mm_mask_blend_epi16(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpblendmw

Blend packed 16-bit integers from *a* and *b* using control mask *k*, and return the results.

_mm256_mask_blend_epi16

```
__m256i _mm256_mask_blend_epi16(__mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpblendmw

Blend packed 16-bit integers from *a* and *b* using control mask *k*, and return the results.

_mm512_mask_blend_epi16

```
__m512i _mm512_mask_blend_epi16(__mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpblendmw

Blend packed 16-bit integers from *a* and *b* using control mask *k*, and return the results.

_mm_mask_broadcastb_epi8

```
__m128i _mm_mask_broadcastb_epi8(__m128i src, __mmask16 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpbroadcastb

Broadcast the low packed 8-bit integer from *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_broadcastb_epi8

```
__m128i _mm_maskz_broadcastb_epi8(__mmask16 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpbroadcastb

Broadcast the low packed 8-bit integer from *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_broadcastb_epi8

```
__m256i _mm256_mask_broadcastb_epi8(__m256i src, __mmask32 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpbroadcastb

Broadcast the low packed 8-bit integer from *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_broadcastb_epi8

```
__m256i _mm256_maskz_broadcastb_epi8(__mmask32 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpbroadcastb

Broadcast the low packed 8-bit integer from *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_broadcastb_epi8

```
__m512i _mm512_broadcastb_epi8(__m128i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpbroadcastb

Broadcast the low packed 8-bit integer from *a* to all elements of the return value.

_mm512_mask_broadcastb_epi8

```
__m512i _mm512_mask_broadcastb_epi8(__m512i src, __mmask64 k, __m128i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpbroadcastb

Broadcast the low packed 8-bit integer from *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_broadcastb_epi8

```
__m512i _mm512_maskz_broadcastb_epi8(__mmask64 k, __m128i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpbroadcastb

Broadcast the low packed 8-bit integer from *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_broadcastd_epi32

```
__m128i _mm_mask_broadcastd_epi32(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpbroadcastd

Broadcast the low packed 32-bit integer from *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_broadcastd_epi32

```
__m128i _mm_maskz_broadcastd_epi32(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpbroadcastd

Broadcast the low packed 32-bit integer from *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_broadcastd_epi32

```
__m256i _mm256_mask_broadcastd_epi32(__m256i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpbroadcastd

Broadcast the low packed 32-bit integer from *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_broadcastd_epi32

```
__m256i _mm256_maskz_broadcastd_epi32(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpbroadcastd

Broadcast the low packed 32-bit integer from *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_broadcastmb_epi64

```
__m128i _mm_broadcastmb_epi64(__mmask8 k)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vpbroadcastmb2q

Broadcast the low 8-bits from input mask *k* to all 64-bit elements of the return value.

_mm256_broadcastmb_epi64

```
__m256i _mm256_broadcastmb_epi64(__mmask8 k)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vpbroadcastmb2q

Broadcast the low 8-bits from input mask *k* to all 64-bit elements of the return value.

_mm_broadcastmw_epi32

```
__m128i _mm_broadcastmw_epi32(__mmask16 k)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vpbroadcastmw2d

Broadcast the low 16-bits from input mask *k* to all 32-bit elements of the return value.

_mm256_broadcastmw_epi32

```
__m256i _mm256_broadcastmw_epi32(__mmask16 k)
```

CPUID Flags: AVX512CD, AVX512VL

Instruction(s): vpbroadcastmw2d

Broadcast the low 16-bits from input mask *k* to all 32-bit elements of the return value.

_mm_mask_broadcastq_epi64

```
__m128i _mm_mask_broadcastq_epi64(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpbroadcastq

Broadcast the low packed 64-bit integer from *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_broadcastq_epi64

```
__m128i _mm_maskz_broadcastq_epi64(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpbroadcastq

Broadcast the low packed 64-bit integer from *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_broadcastq_epi64

```
__m256i _mm256_mask_broadcastq_epi64(__m256i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpbroadcastq

Broadcast the low packed 64-bit integer from *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_broadcastq_epi64

```
__m256i _mm256_maskz_broadcastq_epi64(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpbroadcastq

Broadcast the low packed 64-bit integer from *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_broadcastw_epi16

```
__m128i _mm_mask_broadcastw_epi16(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpbroadcastw

Broadcast the low packed 16-bit integer from *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_broadcastw_epi16

```
__m128i _mm_maskz_broadcastw_epi16(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpbroadcastw

Broadcast the low packed 16-bit integer from *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_broadcastw_epi16

```
__m256i _mm256_mask_broadcastw_epi16(__m256i src, __mmask16 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpbroadcastw

Broadcast the low packed 16-bit integer from *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_broadcastw_epi16

```
__m256i _mm256_maskz_broadcastw_epi16(__mmask16 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpbroadcastw

Broadcast the low packed 16-bit integer from *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_broadcastw_epi16

```
__m512i _mm512_broadcastw_epi16(__m128i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpbroadcastw

Broadcast the low packed 16-bit integer from *a* to all elements of the return value.

_mm512_mask_broadcastw_epi16

```
__m512i _mm512_mask_broadcastw_epi16(__m512i src, __mmask32 k, __m128i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpbroadcastw

Broadcast the low packed 16-bit integer from *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_broadcastw_epi16

```
__m512i _mm512_maskz_broadcastw_epi16(__mmask32 k, __m128i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpbroadcastw

Broadcast the low packed 16-bit integer from *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_compress_epi32

```
__m128i _mm_mask_compress_epi32(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcompressd

Contiguously store the active 32-bit integers in *a* (those with their respective bit set in writemask *k*) to the return value, and pass through the remaining elements from *src*.

_mm_maskz_compress_epi32

```
__m128i _mm_maskz_compress_epi32(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcompressd

Contiguously store the active 32-bit integers in *a* (those with their respective bit set in zeromask *k*) to the return value, and set the remaining elements to zero.

_mm256_mask_compress_epi32

```
__m256i _mm256_mask_compress_epi32(__m256i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcompressd

Contiguously store the active 32-bit integers in *a* (those with their respective bit set in writemask *k*) to the return value, and pass through the remaining elements from *src*.

_mm256_maskz_compress_epi32

```
__m256i _mm256_maskz_compress_epi32(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcompressd

Contiguously store the active 32-bit integers in *a* (those with their respective bit set in zeromask *k*) to the return value, and set the remaining elements to zero.

_mm_mask_compress_epi64

```
__m128i _mm_mask_compress_epi64(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcompressq

Contiguously store the active 64-bit integers in *a* (those with their respective bit set in writemask *k*) to the return value, and pass through the remaining elements from *src*.

_mm_maskz_compress_epi64

```
__m128i _mm_maskz_compress_epi64(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcompressq

Contiguously store the active 64-bit integers in *a* (those with their respective bit set in zeromask *k*) to the return value, and set the remaining elements to zero.

_mm256_mask_compress_epi64

```
__m256i _mm256_mask_compress_epi64(__m256i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcompressq

Contiguously store the active 64-bit integers in *a* (those with their respective bit set in writemask *k*) to the return value, and pass through the remaining elements from *src*.

_mm256_maskz_compress_epi64

```
__m256i _mm256_maskz_compress_epi64(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcompressq

Contiguously store the active 64-bit integers in *a* (those with their respective bit set in zeromask *k*) to the return value, and set the remaining elements to zero.

_mm256_mask_permutexvar_epi32

```
__m256i _mm256_mask_permutexvar_epi32(__m256i src, __mmask8 k, __m256i idx, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermd

Shuffle 32-bit integers in *a* across lanes using the corresponding index in *idx*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_permutexvar_epi32

```
__m256i _mm256_maskz_permutexvar_epi32(__mmask8 k, __m256i idx, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermd

Shuffle 32-bit integers in *a* across lanes using the corresponding index in *idx*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_permutexvar_epi32

```
__m256i _mm256_permutexvar_epi32(__m256i idx, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermd

Shuffle 32-bit integers in *a* across lanes using the corresponding index in *idx*, and return the results.

_mm_mask2_permutex2var_epi32

```
__m128i _mm_mask2_permutex2var_epi32(__m128i a, __m128i idx, __mmask8 k, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2d

Shuffle 32-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using writemask *k* (elements are copied from *idx* when the corresponding mask bit is not set).

_mm256_mask2_permutex2var_epi32

```
__m256i _mm256_mask2_permutex2var_epi32(__m256i a, __m256i idx, __mmask8 k, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2d

Shuffle 32-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using writemask *k* (elements are copied from *idx* when the corresponding mask bit is not set).

_mm_maskz_permutex2var_epi32

```
__m128i _mm_maskz_permutex2var_epi32(__mmask8 k, __m128i a, __m128i idx, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2d, vpermt2d

Shuffle 32-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_permutex2var_epi32

```
__m128i _mm_permutex2var_epi32(__m128i a, __m128i idx, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2d, vpermt2d

Shuffle 32-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results.

_mm256_maskz_permutex2var_epi32

```
__m256i _mm256_maskz_permutex2var_epi32(__mmask8 k, __m256i a, __m256i idx, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2d, vpermt2d

Shuffle 32-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_permutex2var_epi32

```
__m256i _mm256_permutex2var_epi32(__m256i a, __m256i idx, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2d, vpermt2d

Shuffle 32-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results.

_mm_mask2_permutex2var_epi64

```
__m128i _mm_mask2_permutex2var_epi64(__m128i a, __m128i idx, __mmask8 k, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2q

Shuffle 64-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using writemask *k* (elements are copied from *idx* when the corresponding mask bit is not set).

_mm256_mask2_permutex2var_epi64

```
__m256i _mm256_mask2_permutex2var_epi64(__m256i a, __m256i idx, __mmask8 k, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2q

Shuffle 64-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using writemask *k* (elements are copied from *idx* when the corresponding mask bit is not set).

_mm_maskz_permutex2var_epi64

```
__m128i _mm_maskz_permutex2var_epi64(__mmask8 k, __m128i a, __m128i idx, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2q, vpermt2q

Shuffle 64-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_permutex2var_epi64

```
__m128i _mm_permutex2var_epi64(__m128i a, __m128i idx, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2q, vpermt2q

Shuffle 64-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results.

_mm256_maskz_permutex2var_epi64

```
__m256i _mm256_maskz_permutex2var_epi64(__mmask8 k, __m256i a, __m256i idx, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2q, vpermt2q

Shuffle 64-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_permutex2var_epi64

```
__m256i _mm256_permutex2var_epi64(__m256i a, __m256i idx, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermi2q, vpermt2q

Shuffle 64-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results.

_mm_mask2_permutex2var_epi16

```
__m128i _mm_mask2_permutex2var_epi16(__m128i a, __m128i idx, __mmask8 k, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpermi2w

Shuffle 16-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using writemask *k* (elements are copied from *idx* when the corresponding mask bit is not set).

_mm256_mask2_permutex2var_epi16

```
__m256i _mm256_mask2_permutex2var_epi16(__m256i a, __m256i idx, __mmask16 k, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpermi2w

Shuffle 16-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using writemask *k* (elements are copied from *idx* when the corresponding mask bit is not set).

_mm512_mask2_permutex2var_epi16

```
__m512i _mm512_mask2_permutex2var_epi16(__m512i a, __m512i idx, __mmask32 k, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpermi2w

Shuffle 16-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using writemask *k* (elements are copied from *idx* when the corresponding mask bit is not set).

_mm_maskz_permutex2var_epi16

```
__m128i _mm_maskz_permutex2var_epi16(__mmask8 k, __m128i a, __m128i idx, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpermi2w, vpermt2w

Shuffle 16-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_permutex2var_epi16

```
__m128i _mm_permutex2var_epi16(__m128i a, __m128i idx, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpermi2w, vpermt2w

Shuffle 16-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results.

_mm256_maskz_permutex2var_epi16

```
__m256i _mm256_maskz_permutex2var_epi16(__mmask16 k, __m256i a, __m256i idx, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpermi2w, vpermt2w

Shuffle 16-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_permutex2var_epi16

```
__m256i _mm256_permutex2var_epi16(__m256i a, __m256i idx, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpermi2w, vpermt2w

Shuffle 16-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results.

_mm512_maskz_permutex2var_epi16

```
__m512i _mm512_maskz_permutex2var_epi16(__mmask32 k, __m512i a, __m512i idx, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpermi2w, vpermt2w

Shuffle 16-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_permutex2var_epi16

```
__m512i _mm512_permutex2var_epi16(__m512i a, __m512i idx, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpermi2w, vpermt2w

Shuffle 16-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results.

_mm256_mask_permutex_epi64

```
__m256i _mm256_mask_permutex_epi64(__m256i src, __mmask8 k, __m256i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermq

Shuffle 64-bit integers in *a* across lanes lanes using the control in *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_mask_permutexvar_epi64

```
__m256i _mm256_mask_permutexvar_epi64(__m256i src, __mmask8 k, __m256i idx, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermq

Shuffle 64-bit integers in *a* across lanes using the corresponding index in *idx*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_permutex_epi64

```
__m256i _mm256_maskz_permutex_epi64(__mmask8 k, __m256i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermq

Shuffle 64-bit integers in *a* across lanes using the control in *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_maskz_permutexvar_epi64

```
__m256i _mm256_maskz_permutexvar_epi64(__mmask8 k, __m256i idx, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermq

Shuffle 64-bit integers in *a* across lanes using the corresponding index in *idx*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_permutex_epi64

```
__m256i _mm256_permutex_epi64(__m256i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermq

Shuffle 64-bit integers in *a* across lanes using the control in *imm*, and return the results.

_mm256_permutexvar_epi64

```
__m256i _mm256_permutexvar_epi64(__m256i idx, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermq

Shuffle 64-bit integers in *a* across lanes using the corresponding index in *idx*, and return the results.

_mm_mask_permutex2var_epi32

```
__m128i _mm_mask_permutex2var_epi32(__m128i a, __mmask8 k, __m128i idx, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermt2d

Shuffle 32-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm256_mask_permutex2var_epi32

```
__m256i _mm256_mask_permutex2var_epi32(__m256i a, __mmask8 k, __m256i idx, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermt2d

Shuffle 32-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm_mask_permutex2var_epi64

```
__m128i _mm_mask_permutex2var_epi64(__m128i a, __mmask8 k, __m128i idx, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermt2q

Shuffle 64-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm256_mask_permutex2var_epi64

```
__m256i _mm256_mask_permutex2var_epi64(__m256i a, __mmask8 k, __m256i idx, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpermt2q

Shuffle 64-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm_mask_permutex2var_epi16

```
__m128i _mm_mask_permutex2var_epi16(__m128i a, __mmask8 k, __m128i idx, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpermt2w

Shuffle 16-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm256_mask_permutex2var_epi16

```
__m256i _mm256_mask_permutex2var_epi16(__m256i a, __mmask16 k, __m256i idx, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpermt2w

Shuffle 16-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm512_mask_permutex2var_epi16

```
__m512i _mm512_mask_permutex2var_epi16(__m512i a, __mmask32 k, __m512i idx, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpermt2w

Shuffle 16-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the results using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm_mask_permutexvar_epi16

```
__m128i _mm_mask_permutexvar_epi16(__m128i src, __mmask8 k, __m128i idx, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpermw

Shuffle 16-bit integers in *a* across lanes using the corresponding index in *idx*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_permutexvar_epi16

```
__m128i _mm_maskz_permutexvar_epi16(__mmask8 k, __m128i idx, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpermw

Shuffle 16-bit integers in *a* across lanes using the corresponding index in *idx*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_permutexvar_epi16

```
__m128i _mm_permutexvar_epi16(__m128i idx, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpermw

Shuffle 16-bit integers in *a* across lanes using the corresponding index in *idx*, and return the results.

_mm256_mask_permutexvar_epi16

```
__m256i _mm256_mask_permutexvar_epi16(__m256i src, __mmask16 k, __m256i idx, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpermw

Shuffle 16-bit integers in *a* across lanes using the corresponding index in *idx*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_permutexvar_epi16

```
__m256i _mm256_maskz_permutexvar_epi16(__mmask16 k, __m256i idx, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpermw

Shuffle 16-bit integers in *a* across lanes using the corresponding index in *idx*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_permutexvar_epi16

```
__m256i _mm256_permutexvar_epi16(__m256i idx, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpermw

Shuffle 16-bit integers in *a* across lanes using the corresponding index in *idx*, and return the results.

_mm512_mask_permutexvar_epi16

```
__m512i _mm512_mask_permutexvar_epi16(__m512i src, __mmask32 k, __m512i idx, __m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpermw

Shuffle 16-bit integers in *a* across lanes using the corresponding index in *idx*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_permutexvar_epi16

```
__m512i _mm512_maskz_permutexvar_epi16(__mmask32 k, __m512i idx, __m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpermw

Shuffle 16-bit integers in *a* across lanes using the corresponding index in *idx*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_permutexvar_epi16

```
__m512i _mm512_permutexvar_epi16(__m512i idx, __m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpermw

Shuffle 16-bit integers in *a* across lanes using the corresponding index in *idx*, and return the results.

_mm_mask_expand_epi32

```
__m128i _mm_mask_expand_epi32(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpexpandd

Load contiguous active 32-bit integers from *a* (those with their respective bit set in mask *k*), and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_expand_epi32

```
__m128i _mm_maskz_expand_epi32(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpexpandd

Load contiguous active 32-bit integers from *a* (those with their respective bit set in mask *k*), and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_expand_epi32

```
__m256i _mm256_mask_expand_epi32(__m256i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpexpandd

Load contiguous active 32-bit integers from *a* (those with their respective bit set in mask *k*), and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_expand_epi32

```
__m256i _mm256_maskz_expand_epi32(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpexpandd

Load contiguous active 32-bit integers from *a* (those with their respective bit set in mask *k*), and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_expand_epi64

```
__m128i _mm_mask_expand_epi64(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpexpandq

Load contiguous active 64-bit integers from *a* (those with their respective bit set in mask *k*), and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_expand_epi64

```
__m128i _mm_maskz_expand_epi64(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpexpandq

Load contiguous active 64-bit integers from *a* (those with their respective bit set in mask *k*), and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_expand_epi64

```
__m256i _mm256_mask_expand_epi64(__m256i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpexpandq

Load contiguous active 64-bit integers from *a* (those with their respective bit set in mask *k*), and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_expand_epi64

```
__m256i _mm256_maskz_expand_epi64(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpexpandq

Load contiguous active 64-bit integers from *a* (those with their respective bit set in mask *k*), and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_movm_epi8

```
__m128i _mm_movm_epi8(__mmask16 k)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovm2b

Set each packed 8-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in *k*.

_mm256_movm_epi8

```
__m256i _mm256_movm_epi8(__mmask32 k)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovm2b

Set each packed 8-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in *k*.

_mm512_movm_epi8

```
__m512i _mm512_movm_epi8(__mmask64 k)
```

CPUID Flags: AVX512BW

Instruction(s): vpmovm2b

Set each packed 8-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in *k*.

_mm_movm_epi32

```
__m128i _mm_movm_epi32(__mmask8 k)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vpmovm2d

Set each packed 32-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in *k*.

_mm256_movm_epi32

```
__m256i _mm256_movm_epi32(__mmask8 k)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vpmovm2d

Set each packed 32-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in *k*.

_mm512_movm_epi32

```
__m512i _mm512_movm_epi32(__mmask16 k)
```

CPUID Flags: AVX512DQ

Instruction(s): vpmovm2d

Set each packed 32-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in *k*.

_mm_movm_epi64

```
__m128i _mm_movm_epi64(__mmask8 k)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vpmovm2q

Set each packed 64-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in *k*.

_mm256_movm_epi64

```
__m256i _mm256_movm_epi64(__mmask8 k)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vpmovm2q

Set each packed 64-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in *k*.

_mm512_movm_epi64

```
__m512i _mm512_movm_epi64(__mmask8 k)
```

CPUID Flags: AVX512DQ

Instruction(s): vpmovm2q

Set each packed 64-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in *k*.

_mm_movm_epi16

```
__m128i _mm_movm_epi16(__mmask8 k)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovm2w

Set each packed 16-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in *k*.

_mm256_movm_epi16

```
__m256i _mm256_movm_epi16(__mmask16 k)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovm2w

Set each packed 16-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in *k*.

_mm512_movm_epi16

```
__m512i _mm512_movm_epi16(__mmask32 k)
```

CPUID Flags: AVX512BW

Instruction(s): vpmovm2w

Set each packed 16-bit integer in the return value to all ones or all zeros based on the value of the corresponding bit in *k*.

_mm512_sad_epu8

```
__m512i _mm512_sad_epu8(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpsadbw

Compute the absolute differences of packed unsigned 8-bit integers in *a* and *b*, then horizontally sum each consecutive 8 differences to produce four unsigned 16-bit integers, and pack these unsigned 16-bit integers in the low 16 bits of 64-bit elements in the return value.

_mm_mask_shuffle_epi8

```
__m128i _mm_mask_shuffle_epi8(__m128i src, __mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpshufb

Shuffle packed 8-bit integers in *a* according to shuffle control mask in the corresponding 8-bit element of *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_shuffle_epi8

```
__m128i _mm_maskz_shuffle_epi8(__mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpshufb

Shuffle packed 8-bit integers in *a* according to shuffle control mask in the corresponding 8-bit element of *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_shuffle_epi8

```
__m256i _mm256_mask_shuffle_epi8(__m256i src, __mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpshufb

Shuffle packed 8-bit integers in *a* according to shuffle control mask in the corresponding 8-bit element of *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_shuffle_epi8

```
__m256i _mm256_maskz_shuffle_epi8(__mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpshufb

Shuffle packed 8-bit integers in *a* according to shuffle control mask in the corresponding 8-bit element of *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_shuffle_epi8

```
__m512i _mm512_mask_shuffle_epi8(__m512i src, __mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpshufb

Shuffle 8-bit integers in *a* within 128-bit lanes using the control in the corresponding 8-bit element of *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_shuffle_epi8

```
__m512i _mm512_maskz_shuffle_epi8(__mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpshufb

Shuffle packed 8-bit integers in *a* according to shuffle control mask in the corresponding 8-bit element of *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_shuffle_epi8

```
__m512i _mm512_shuffle_epi8(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpshufb

Shuffle packed 8-bit integers in *a* according to shuffle control mask in the corresponding 8-bit element of *b*, and return the results.

_mm_mask_shuffle_epi32

```
__m128i _mm_mask_shuffle_epi32(__m128i src, __mmask8 k, __m128i a, _MM_PERM_ENUM imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpshufd

Shuffle 32-bit integers in *a* using the control in *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_shuffle_epi32

```
__m128i _mm_maskz_shuffle_epi32(__mmask8 k, __m128i a, _MM_PERM_ENUM imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpshufd

Shuffle 32-bit integers in *a* using the control in *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_shuffle_epi32

```
__m256i _mm256_mask_shuffle_epi32(__m256i src, __mmask8 k, __m256i a, _MM_PERM_ENUM imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpshufd

Shuffle 32-bit integers in *a* within 128-bit lanes using the control in *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_shuffle_epi32

```
__m256i _mm256_maskz_shuffle_epi32(__mmask8 k, __m256i a, _MM_PERM_ENUM imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpshufd

Shuffle 32-bit integers in *a* within 128-bit lanes using the control in *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_shufflehi_epi16

```
__m128i _mm_mask_shufflehi_epi16(__m128i src, __mmask8 k, __m128i a, int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpshufhw

Shuffle 16-bit integers in the high 64 bits of *a* using the control in *imm*. Store the results in the high 64 bits of the return value, with the low 64 bits being copied from from *a* to *dst*, using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_shufflehi_epi16

```
__m128i _mm_maskz_shufflehi_epi16(__mmask8 k, __m128i a, int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpshufhw

Shuffle 16-bit integers in the high 64 bits of *a* using the control in *imm*. Store the results in the high 64 bits of the return value, with the low 64 bits being copied from from *a* to *dst*, using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_shufflehi_epi16

```
__m256i _mm256_mask_shufflehi_epi16(__m256i src, __mmask16 k, __m256i a, int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpshufhw

Shuffle 16-bit integers in the high 64 bits of 128-bit lanes of *a* using the control in *imm*. Store the results in the high 64 bits of 128-bit lanes of the return value, with the low 64 bits of 128-bit lanes being copied from from *a* to *dst*, using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_shufflehi_epi16

```
__m256i _mm256_maskz_shufflehi_epi16(__mmask16 k, __m256i a, int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpshufhw

Shuffle 16-bit integers in the high 64 bits of 128-bit lanes of *a* using the control in *imm*. Store the results in the high 64 bits of 128-bit lanes of the return value, with the low 64 bits of 128-bit lanes being copied from from *a* to *dst*, using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_shufflehi_epi16

```
__m512i _mm512_mask_shufflehi_epi16(__m512i src, __mmask32 k, __m512i a, int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpshufhw

Shuffle 16-bit integers in the high 64 bits of 128-bit lanes of *a* using the control in *imm*. Store the results in the high 64 bits of 128-bit lanes of the return value, with the low 64 bits of 128-bit lanes being copied from from *a* to *dst*, using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_shufflehi_epi16

```
__m512i _mm512_maskz_shufflehi_epi16(__mmask32 k, __m512i a, int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpshufhw

Shuffle 16-bit integers in the high 64 bits of 128-bit lanes of *a* using the control in *imm*. Store the results in the high 64 bits of 128-bit lanes of the return value, with the low 64 bits of 128-bit lanes being copied from from *a* to *dst*, using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_shufflehi_epi16

```
__m512i _mm512_shufflehi_epi16(__m512i a, int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpshufhw

Shuffle 16-bit integers in the high 64 bits of 128-bit lanes of *a* using the control in *imm*. Store the results in the high 64 bits of 128-bit lanes of the return value, with the low 64 bits of 128-bit lanes being copied from from *a* to *dst*.

_mm_mask_shufflelo_epi16

```
__m128i _mm_mask_shufflelo_epi16(__m128i src, __mmask8 k, __m128i a, int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpshuflw

Shuffle 16-bit integers in the low 64 bits of *a* using the control in *imm*. Store the results in the low 64 bits of the return value, with the high 64 bits being copied from from *a* to *dst*, using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_shufflelo_epi16

```
__m128i _mm_maskz_shufflelo_epi16(__mmask8 k, __m128i a, int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpshuflw

Shuffle 16-bit integers in the low 64 bits of *a* using the control in *imm*. Store the results in the low 64 bits of the return value, with the high 64 bits being copied from from *a* to *dst*, using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_shufflelo_epi16

```
__m256i _mm256_mask_shufflelo_epi16(__m256i src, __mmask16 k, __m256i a, int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpshuflw

Shuffle 16-bit integers in the low 64 bits of 128-bit lanes of *a* using the control in *imm*. Store the results in the low 64 bits of 128-bit lanes of the return value, with the high 64 bits of 128-bit lanes being copied from from *a* to *dst*, using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_shufflelo_epi16

```
__m256i _mm256_maskz_shufflelo_epi16(__mmask16 k, __m256i a, int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpshuflw

Shuffle 16-bit integers in the low 64 bits of 128-bit lanes of *a* using the control in *imm*. Store the results in the low 64 bits of 128-bit lanes of the return value, with the high 64 bits of 128-bit lanes being copied from from *a* to *dst*, using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_shufflelo_epi16

```
__m512i _mm512_mask_shufflelo_epi16(__m512i src, __mmask32 k, __m512i a, int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpshuflw

Shuffle 16-bit integers in the low 64 bits of 128-bit lanes of *a* using the control in *imm*. Store the results in the low 64 bits of 128-bit lanes of the return value, with the high 64 bits of 128-bit lanes being copied from from *a* to *dst*, using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_shufflelo_epi16

```
__m512i _mm512_maskz_shufflelo_epi16(__mmask32 k, __m512i a, int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpshuflw

Shuffle 16-bit integers in the low 64 bits of 128-bit lanes of *a* using the control in *imm*. Store the results in the low 64 bits of 128-bit lanes of the return value, with the high 64 bits of 128-bit lanes being copied from from *a* to *dst*, using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_shufflelo_epi16

```
__m512i _mm512_shufflelo_epi16(__m512i a, int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpshuflw

Shuffle 16-bit integers in the low 64 bits of 128-bit lanes of *a* using the control in *imm*. Store the results in the low 64 bits of 128-bit lanes of the return value, with the high 64 bits of 128-bit lanes being copied from from *a* to *dst*.

_mm_mask_unpackhi_epi8

```
__m128i _mm_mask_unpackhi_epi8(__m128i src, __mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpunpckhbw

Unpack and interleave 8-bit integers from the high half of *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_unpackhi_epi8

```
__m128i _mm_maskz_unpackhi_epi8(__mmask16 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpunpckhbw

Unpack and interleave 8-bit integers from the high half of *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_unpackhi_epi8

```
__m256i _mm256_mask_unpackhi_epi8(__m256i src, __mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpunpckhbw

Unpack and interleave 8-bit integers from the high half of each 128-bit lane in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_unpackhi_epi8

```
__m256i _mm256_maskz_unpackhi_epi8(__mmask32 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpunpckhbw

Unpack and interleave 8-bit integers from the high half of each 128-bit lane in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_unpackhi_epi8

```
__m512i _mm512_mask_unpackhi_epi8(__m512i src, __mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpunpckhbw

Unpack and interleave 8-bit integers from the high half of each 128-bit lane in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_unpackhi_epi8

```
__m512i _mm512_maskz_unpackhi_epi8(__mmask64 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpunpckhbw

Unpack and interleave 8-bit integers from the high half of each 128-bit lane in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_unpackhi_epi8

```
__m512i _mm512_unpackhi_epi8(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpunpckhbw

Unpack and interleave 8-bit integers from the high half of each 128-bit lane in *a* and *b*, and return the results.

_mm_mask_unpackhi_epi32

```
__m128i _mm_mask_unpackhi_epi32(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpunpckhdq

Unpack and interleave 32-bit integers from the high half of *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_unpackhi_epi32

```
__m128i _mm_maskz_unpackhi_epi32(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpunpckhdq

Unpack and interleave 32-bit integers from the high half of *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_unpackhi_epi32

```
__m256i _mm256_mask_unpackhi_epi32(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpunpckhdq

Unpack and interleave 32-bit integers from the high half of each 128-bit lane in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_unpackhi_epi32

```
__m256i _mm256_maskz_unpackhi_epi32(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpunpckhdq

Unpack and interleave 32-bit integers from the high half of each 128-bit lane in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_unpackhi_epi64

```
__m128i _mm_mask_unpackhi_epi64(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpunpckhqdq

Unpack and interleave 64-bit integers from the high half of *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_unpackhi_epi64

```
__m128i _mm_maskz_unpackhi_epi64(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpunpckhqdq

Unpack and interleave 64-bit integers from the high half of *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_unpackhi_epi64

```

CPUID Flags: AVX512BW

Instruction(s): vpunpcklbw

Unpack and interleave 8-bit integers from the low half of each 128-bit lane in *a* and *b*, and return the results.

_mm_mask_unpacklo_epi32

```
__m128i _mm_mask_unpacklo_epi32(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpunpckldq

Unpack and interleave 32-bit integers from the low half of *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_unpacklo_epi32

```
__m128i _mm_maskz_unpacklo_epi32(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpunpckldq

Unpack and interleave 32-bit integers from the low half of *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_unpacklo_epi32

```
__m256i _mm256_mask_unpacklo_epi32(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpunpckldq

Unpack and interleave 32-bit integers from the low half of each 128-bit lane in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_unpacklo_epi32

```
__m256i _mm256_maskz_unpacklo_epi32(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpunpckldq

Unpack and interleave 32-bit integers from the low half of each 128-bit lane in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_unpacklo_epi64

```
__m128i _mm_mask_unpacklo_epi64(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpunpcklqdq

Unpack and interleave 64-bit integers from the low half of *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_unpacklo_epi64

```
__m128i _mm_maskz_unpacklo_epi64(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpunpcklqdq

Unpack and interleave 64-bit integers from the low half of *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_unpacklo_epi64

```
__m256i _mm256_mask_unpacklo_epi64(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpunpcklqdq

Unpack and interleave 64-bit integers from the low half of each 128-bit lane in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_unpacklo_epi64

```
__m256i _mm256_maskz_unpacklo_epi64(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpunpcklqdq

Unpack and interleave 64-bit integers from the low half of each 128-bit lane in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_unpacklo_epi16

```
__m128i _mm_mask_unpacklo_epi16(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpunpcklwd

Unpack and interleave 16-bit integers from the low half of *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_unpacklo_epi16

```
__m128i _mm_maskz_unpacklo_epi16(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpunpcklwd

Unpack and interleave 16-bit integers from the low half of *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_unpacklo_epi16

```
__m256i _mm256_mask_unpacklo_epi16(__m256i src, __mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpunpcklwd

Unpack and interleave 16-bit integers from the low half of each 128-bit lane in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_unpacklo_epi16

```
__m256i _mm256_maskz_unpacklo_epi16(__mmask16 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpunpcklwd

Unpack and interleave 16-bit integers from the low half of each 128-bit lane in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_unpacklo_epi16

```
__m512i _mm512_mask_unpacklo_epi16(__m512i src, __mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpunpcklwd

Unpack and interleave 16-bit integers from the low half of each 128-bit lane in *a* and *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_unpacklo_epi16

```
__m512i _mm512_maskz_unpacklo_epi16(__mmask32 k, __m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpunpcklwd

Unpack and interleave 16-bit integers from the low half of each 128-bit lane in *a* and *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_unpacklo_epi16

```
__m512i _mm512_unpacklo_epi16(__m512i a, __m512i b)
```

CPUID Flags: AVX512BW

Instruction(s): vpunpcklwd

Unpack and interleave 16-bit integers from the low half of each 128-bit lane in *a* and *b*, and return the results.

_mm512_kunpackd

```
__mmask64 _mm512_kunpackd(__mmask64 a, __mmask64 b)
```

CPUID Flags: AVX512BW

Instruction(s): kunpckdq

Unpack and interleave 32 bits from masks *a* and *b*, and return the 64-bit result.

_mm512_kunpackw

```
__mmask32 _mm512_kunpackw(__mmask32 a, __mmask32 b)
```

CPUID Flags: AVX512BW

Instruction(s): kunpckwd

Unpack and interleave 16 bits from masks *a* and *b*, and store the 32-bit result in *k*.

_mm_fpclass_pd_mask

```
__mmask8 _mm_fpclass_pd_mask(__m128d a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vfpclasspd

Test packed double-precision (64-bit) floating-point elements in *a* for special categories specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm_mask_fpclass_pd_mask

```
__mmask8 _mm_mask_fpclass_pd_mask(__mmask8 k1, __m128d a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vfpclasspd

Test packed double-precision (64-bit) floating-point elements in *a* for special categories specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_fpclass_pd_mask

```
__mmask8 _mm256_fpclass_pd_mask(__m256d a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vfpclasspd

Test packed double-precision (64-bit) floating-point elements in *a* for special categories specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm256_mask_fpclass_pd_mask

```
__mmask8 _mm256_mask_fpclass_pd_mask(__mmask8 k1, __m256d a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vfpclasspd

Test packed double-precision (64-bit) floating-point elements in *a* for special categories specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_fpclass_pd_mask

```
__mmask8 _mm512_fpclass_pd_mask(__m512d a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vfpclasspd

Test packed double-precision (64-bit) floating-point elements in *a* for special categories specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm512_mask_fpclass_pd_mask

```
__mmask8 _mm512_mask_fpclass_pd_mask(__mmask8 k1, __m512d a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vfpclasspd

Test packed double-precision (64-bit) floating-point elements in *a* for special categories specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm_fpclass_ps_mask

```
__mmask8 _mm_fpclass_ps_mask(__m128 a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vfpclassps

Test packed single-precision (32-bit) floating-point elements in *a* for special categories specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm_mask_fpclass_ps_mask

```
__mmask8 _mm_mask_fpclass_ps_mask(__mmask8 k1, __m128 a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vfpclassps

Test packed single-precision (32-bit) floating-point elements in *a* for special categories specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_fpclass_ps_mask

```
__mmask8 _mm256_fpclass_ps_mask(__m256 a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vfpclassps

Test packed single-precision (32-bit) floating-point elements in *a* for special categories specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm256_mask_fpclass_ps_mask

```
__mmask8 _mm256_mask_fpclass_ps_mask(__mmask8 k1, __m256 a, int imm)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vfpclassps

Test packed single-precision (32-bit) floating-point elements in *a* for special categories specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_fpclass_ps_mask

```
__mmask16 _mm512_fpclass_ps_mask(__m512 a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vfpclassps

Test packed single-precision (32-bit) floating-point elements in *a* for special categories specified by *imm*, and and put each result in the corresponding bit of the returned mask value.

_mm512_mask_fpclass_ps_mask

```
__mmask16 _mm512_mask_fpclass_ps_mask(__mmask16 k1, __m512 a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vfpclassps

Test packed single-precision (32-bit) floating-point elements in *a* for special categories specified by *imm*, and and put each result in the corresponding bit of the returned mask value using zeromask *k1* (elements are zeroed out when the corresponding mask bit is not set).

_mm_fpclass_sd_mask

```
__mmask8 _mm_fpclass_sd_mask(__m128d a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vfpclasssd

Test the lower double-precision (64-bit) floating-point element in *a* for special categories specified by *imm*, and and put the result in the returned mask value.

_mm_mask_fpclass_sd_mask

```
__mmask8 _mm_mask_fpclass_sd_mask(__mmask8 k1, __m128d a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vfpclasssd

Test the lower double-precision (64-bit) floating-point element in *a* for special categories specified by *imm*, and and put the result in the returned mask value using zeromask *k1* (the element is zeroed out when mask bit 0 is not set).

_mm_fpclass_ss_mask

```
__mmask8 _mm_fpclass_ss_mask(__m128 a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vfpclassss

Test the lower single-precision (32-bit) floating-point element in *a* for special categories specified by *imm*, and store the result in mask vector "k.

_mm_mask_fpclass_ss_mask

```
__mmask8 _mm_mask_fpclass_ss_mask(__mmask8 k1, __m128 a, int imm)
```

CPUID Flags: AVX512DQ

Instruction(s): vfpclassss

Test the lower single-precision (32-bit) floating-point element in *a* for special categories specified by *imm*, and and put the result in the returned mask value using zeromask *k1* (the element is zeroed out when mask bit 0 is not set).

_mm_movepi8_mask

```
__mmask16 _mm_movepi8_mask(__m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovb2m

Set each bit of the returned mask value based on the most significant bit of the corresponding packed 8-bit integer in *a*.

_mm256_movepi8_mask

```
__mmask32 _mm256_movepi8_mask(__m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovb2m

Set each bit of the returned mask value based on the most significant bit of the corresponding packed 8-bit integer in *a*.

_mm512_movepi8_mask

```
__mmask64 _mm512_movepi8_mask(__m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpmovb2m

Set each bit of the returned mask value based on the most significant bit of the corresponding packed 8-bit integer in *a*.

_mm_movepi32_mask

```
__mmask8 _mm_movepi32_mask(__m128i a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vpmovd2m

Set each bit of the returned mask value based on the most significant bit of the corresponding packed 32-bit integer in *a*.

_mm256_movepi32_mask

```
__mmask8 _mm256_movepi32_mask(__m256i a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vpmovd2m

Set each bit of the returned mask value based on the most significant bit of the corresponding packed 32-bit integer in *a*.

_mm512_movepi32_mask

```
__mmask16 _mm512_movepi32_mask(__m512i a)
```

CPUID Flags: AVX512DQ

Instruction(s): vpmovd2m

Set each bit of the returned mask value based on the most significant bit of the corresponding packed 32-bit integer in *a*.

_mm_movepi64_mask

```
__mmask8 _mm_movepi64_mask(__m128i a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vpmovq2m

Set each bit of the returned mask value based on the most significant bit of the corresponding packed 64-bit integer in *a*.

_mm256_movepi64_mask

```
__mmask8 _mm256_movepi64_mask(__m256i a)
```

CPUID Flags: AVX512DQ, AVX512VL

Instruction(s): vpmovq2m

Set each bit of the returned mask value based on the most significant bit of the corresponding packed 64-bit integer in *a*.

_mm512_movepi64_mask

```
__mmask8 _mm512_movepi64_mask(__m512i a)
```

CPUID Flags: AVX512DQ

Instruction(s): vpmovq2m

Set each bit of the returned mask value based on the most significant bit of the corresponding packed 64-bit integer in *a*.

_mm_movepi16_mask

```
__mmask8 _mm_movepi16_mask(__m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovw2m

Set each bit of the returned mask value based on the most significant bit of the corresponding packed 16-bit integer in *a*.

_mm256_movepi16_mask

```
__mmask16 _mm256_movepi16_mask(__m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpmovw2m

Set each bit of the returned mask value based on the most significant bit of the corresponding packed 16-bit integer in *a*.

_mm512_movepi16_mask

```
__mmask32 _mm512_movepi16_mask(__m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vpmovw2m

Set each bit of the returned mask value based on the most significant bit of the corresponding packed 16-bit integer in *a*.

_mm_permutexvar_epi8

```
__m128i _mm_permutexvar_epi8(__m128i idx, __m128i a)
```

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpermb

Shuffle 8-bit integers in *a* across lanes using the corresponding index in *idx*, and return the result.

_mm_mask_permutexvar_epi8

```
__m128i _mm_mask_permutexvar_epi8(__m128i src, __mmask16 k, __m128i idx, __m128i a)
```

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpermb

Shuffle 8-bit integers in *a* across lanes using the corresponding index in *idx*, and return the result using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_permutexvar_epi8

```
__m128i _mm_maskz_permutexvar_epi8(__mmask16 k, __m128i idx, __m128i a)
```

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpermb

Shuffle 8-bit integers in *a* across lanes using the corresponding index in *idx*, and return the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_permutexvar_epi8

```
__m256i _mm256_permutexvar_epi8(__m256i idx, __m256i a)
```

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpermb

Shuffle 8-bit integers in *a* across lanes using the corresponding index in *idx*, and return the result.

_mm256_mask_permutexvar_epi8

```
__m256i _mm256_mask_permutexvar_epi8(__m256i src, __mmask32 k, __m256i idx, __m256i a)
```

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpermb

Shuffle 8-bit integers in *a* across lanes using the corresponding index in *idx*, and return the result using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_permutexvar_epi8

```
__m256i _mm256_maskz_permutexvar_epi8(__mmask32 k, __m256i idx, __m256i a)
```

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpermb

Shuffle 8-bit integers in *a* across lanes using the corresponding index in *idx*, and return the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_permutexvar_epi8

```
__m512i _mm512_permutexvar_epi8(__m512i idx, __m512i a)
```

CPUID Flags: AVX512VBMI

Instruction(s): vpermb

Shuffle 8-bit integers in *a* and *b* across lanes using the corresponding selector and index in *idx*, and return the result.

_mm512_mask_permutexvar_epi8

```
__m512i _mm512_mask_permutexvar_epi8(__m512i src, __mmask64 k, __m512i idx, __m512i a)
```

CPUID Flags: AVX512VBMI

Instruction(s): vpermb

Shuffle 8-bit integers in *a* across lanes using the corresponding index in *idx*, and return the result using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_permutexvar_epi8

```
__m512i _mm512_maskz_permutexvar_epi8(__mmask64 k, __m512i idx, __m512i a)
```

CPUID Flags: AVX512VBMI

Instruction(s): vpermb

Shuffle 8-bit integers in *a* across lanes using the corresponding index in *idx*, and return the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_permutex2var_epi8

```
__m128i _mm_permutex2var_epi8(__m128i a, __m128i idx, __m128i b)
```

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpermi2b

Shuffle 8-bit integers in *a* and *b* using the corresponding index in *idx*, and return the result.

_mm_mask_permutex2var_epi8

```
__m128i _mm_mask_permutex2var_epi8(__m128i a, __mmask16 k, __m128i idx, __m128i b)
```

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpermt2b

Shuffle 8-bit integers in *a* and *b* using the corresponding index in *idx*, and return the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm_mask2_permutex2var_epi8

```
__m128i _mm_mask2_permutex2var_epi8(__m128i a, __m128i idx, __mmask16 k, __m128i b)
```

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpermi2b

Shuffle 8-bit integers in *a* and *b* using the corresponding index in *idx*, and return the result using writemask *k* (elements are copied from *idx* when the corresponding mask bit is not set).

_mm_maskz_permutex2var_epi8

```
__m128i _mm_maskz_permutex2var_epi8(__mmask16 k, __m128i a, __m128i idx, __m128i b)
```

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpermi2b, vpermt2b

Shuffle 8-bit integers in *a* and *b* using the corresponding index in *idx*, and return the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_permutex2var_epi8

```
__m256i _mm256_permutex2var_epi8(__m256i a, __m256i idx, __m256i b)
```

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpermi2b

Shuffle 8-bit integers in *a* and *b* across lanes using the corresponding index in *idx*, and return the result.

_mm256_mask_permutex2var_epi8

```
__m256i _mm256_mask_permutex2var_epi8(__m256i a, __mmask32 k, __m256i idx, __m256i b)
```

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpermt2b

Shuffle 8-bit integers in *a* and *b* across lanes using the corresponding index in *idx*, and return the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm256_mask2_permutex2var_epi8

```
__m256i _mm256_mask2_permutex2var_epi8(__m256i a, __m256i idx, __mmask32 k, __m256i b)
```

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpermi2b

Shuffle 8-bit integers in *a* and *b* across lanes using the corresponding index in *idx*, and return the result using writemask *k* (elements are copied from *idx* when the corresponding mask bit is not set).

_mm256_maskz_permutex2var_epi8

```
__m256i _mm256_maskz_permutex2var_epi8(__mmask32 k, __m256i a, __m256i idx, __m256i b)
```

CPUID Flags: AVX512VBMI, AVX512VL

Instruction(s): vpermi2b, vpermt2b

Shuffle 8-bit integers in *a* and *b* across lanes using the corresponding index in *idx*, and return the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_permutex2var_epi8

```
__m512i _mm512_permutex2var_epi8(__m512i a, __m512i idx, __m512i b)
```

CPUID Flags: AVX512VBMI

Instruction(s): vpermi2b

Shuffle 8-bit integers in *a* and *b* across lanes using the corresponding index in *idx*, and return the result.

_mm512_mask_permutex2var_epi8

```
__m512i _mm512_mask_permutex2var_epi8(__m512i a, __mmask64 k, __m512i idx, __m512i b)
```

CPUID Flags: AVX512VBMI

Instruction(s): vpermt2b

Shuffle 8-bit integers in *a* and *b* across lanes using the corresponding index in *idx*, and return the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm512_mask2_permutex2var_epi8

```
__m512i _mm512_mask2_permutex2var_epi8(__m512i a, __m512i idx, __mmask64 k, __m512i b)
```

CPUID Flags: AVX512VBMI

Instruction(s): vpermi2b

Shuffle 8-bit integers in *a* and *b* across lanes using the corresponding index in *idx*, and return the result using writemask *k* (elements are copied from *idx* when the corresponding mask bit is not set).

_mm512_maskz_permutex2var_epi8

```
__m512i _mm512_maskz_permutex2var_epi8(__mmask64 k, __m512i a, __m512i idx, __m512i b)
```

CPUID Flags: AVX512VBMI

Instruction(s): vpermi2b, vpermt2b

Shuffle 8-bit integers in *a* and *b* across lanes using the corresponding index in *idx*, and return the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

Intrinsics for Move Operations

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `zmmintrin.h` header file.
To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

variable	definition
src	source element to use based on writemask result
k	writemask used as a selector
a	first source vector element

_mm_mask_mov_pd

```
__m128d _mm_mask_mov_pd(__m128d src, __mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovapd

Move packed double-precision (64-bit) floating-point elements from *a* to the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_mov_pd

```
__m128d _mm_maskz_mov_pd(__mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovapd

Move packed double-precision (64-bit) floating-point elements from *a* into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_mov_pd

```
__m256d _mm256_mask_mov_pd(__m256d src, __mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovapd

Move packed double-precision (64-bit) floating-point elements from *a* to the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_mov_pd

```
__m256d _mm256_maskz_mov_pd(__mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovapd

Move packed double-precision (64-bit) floating-point elements from *a* into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_mov_ps

```
__m128 _mm_mask_mov_ps(__m128 src, __mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovaps

Move packed single-precision (32-bit) floating-point elements from *a* to the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_mov_ps

```
__m128 _mm_maskz_mov_ps(__mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovaps

Move packed single-precision (32-bit) floating-point elements from *a* into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_mov_ps

```
__m256 _mm256_mask_mov_ps(__m256 src, __mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovaps

Move packed single-precision (32-bit) floating-point elements from *a* to the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_mov_ps

```
__m256 _mm256_maskz_mov_ps(__mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovaps

Move packed single-precision (32-bit) floating-point elements from *a* into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_movedup_pd

```
__m128d _mm_mask_movedup_pd(__m128d src, __mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovddup

Duplicate even-indexed double-precision (64-bit) floating-point elements from *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_movedup_pd

```
__m128d _mm_maskz_movedup_pd(__mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovddup

Duplicate even-indexed double-precision (64-bit) floating-point elements from *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_movedup_pd

```
__m256d _mm256_mask_movedup_pd(__m256d src, __mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovddup

Duplicate even-indexed double-precision (64-bit) floating-point elements from *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_movedup_pd

```
__m256d _mm256_maskz_movedup_pd(__mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovddup

Duplicate even-indexed double-precision (64-bit) floating-point elements from *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_movehdup_ps

```
__m128 _mm_mask_movehdup_ps(__m128 src, __mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovshdup

Duplicate odd-indexed single-precision (32-bit) floating-point elements from *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_movehdup_ps

```
__m128 _mm_maskz_movehdup_ps(__mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovshdup

Duplicate odd-indexed single-precision (32-bit) floating-point elements from *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_movehdup_ps

```
__m256 _mm256_mask_movehdup_ps(__m256 src, __mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovshdup

Duplicate odd-indexed single-precision (32-bit) floating-point elements from *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_movehdup_ps

```
__m256 _mm256_maskz_movehdup_ps(__mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovshdup

Duplicate odd-indexed single-precision (32-bit) floating-point elements from *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_moveldup_ps

```
__m128 _mm_mask_moveldup_ps(__m128 src, __mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovsldup

Duplicate even-indexed single-precision (32-bit) floating-point elements from *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_moveldup_ps

```
__m128 _mm_maskz_moveldup_ps(__mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovsldup

Duplicate even-indexed single-precision (32-bit) floating-point elements from *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_moveldup_ps

```
__m256 _mm256_mask_moveldup_ps(__m256 src, __mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovsldup

Duplicate even-indexed single-precision (32-bit) floating-point elements from *a*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_moveldup_ps

```
__m256 _mm256_maskz_moveldup_ps(__mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovsldup

Duplicate even-indexed single-precision (32-bit) floating-point elements from *a*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_mov_epi32

```
__m128i _mm_mask_mov_epi32(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqa32

Move packed 32-bit integers from *a* to the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_mov_epi32

```
__m128i _mm_maskz_mov_epi32(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqa32

Move packed 32-bit integers from *a* into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_mov_epi32

```
__m256i _mm256_mask_mov_epi32(__m256i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqa32

Move packed 32-bit integers from *a* to the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_mov_epi32

```
__m256i _mm256_maskz_mov_epi32(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqa32

Move packed 32-bit integers from *a* into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_mov_epi64

```
__m128i _mm_mask_mov_epi64(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqa64

Move packed 64-bit integers from *a* to the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_mov_epi64

```
__m128i _mm_maskz_mov_epi64(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqa64

Move packed 64-bit integers from *a* into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_mov_epi64

```
__m256i _mm256_mask_mov_epi64(__m256i src, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqa64

Move packed 64-bit integers from *a* to the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_mov_epi64

```
__m256i _mm256_maskz_mov_epi64(__mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqa64

Move packed 64-bit integers from *a* into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_mov_epi16

```
__m128i _mm_mask_mov_epi16(__m128i src, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vmovdqu16

Move packed 16-bit integers from *a* into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_mov_epi16

```
__m128i _mm_maskz_mov_epi16(__mmask8 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vmovdqu16

Move packed 16-bit integers from *a* into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_mov_epi16

```
__m256i _mm256_mask_mov_epi16(__m256i src, __mmask16 k, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vmovdqu16

Move packed 16-bit integers from *a* into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_mov_epi16

```
__m256i _mm256_maskz_mov_epi16(__mmask16 k, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vmovdqu16

Move packed 16-bit integers from *a* into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_mov_epi16

```
__m512i _mm512_mask_mov_epi16(__m512i src, __mmask32 k, __m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vmovdqu16

Move packed 16-bit integers from *a* into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_mov_epi16

```
__m512i _mm512_maskz_mov_epi16(__mmask32 k, __m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vmovdqu16

Move packed 16-bit integers from *a* into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_mov_epi8

```
__m128i _mm_mask_mov_epi8(__m128i src, __mmask16 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vmovdqu8

Move packed 8-bit integers from *a* into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_mov_epi8

```
__m128i _mm_maskz_mov_epi8(__mmask16 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vmovdqu8

Move packed 8-bit integers from *a* into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_mov_epi8

```
__m256i _mm256_mask_mov_epi8(__m256i src, __mmask32 k, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vmovdqu8

Move packed 8-bit integers from *a* into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_mov_epi8

```
__m256i _mm256_maskz_mov_epi8(__mmask32 k, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vmovdqu8

Move packed 8-bit integers from *a* into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_mov_epi8

```
__m512i _mm512_mask_mov_epi8(__m512i src, __mmask64 k, __m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vmovdqu8

Move packed 8-bit integers from *a* into the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_mov_epi8

```
__m512i _mm512_maskz_mov_epi8(__mmask64 k, __m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vmovdqu8

Move packed 8-bit integers from *a* into the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

Intrinsics for Set Operations

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `zmmintrin.h` header file.
To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

variable	definition
src	source element to use based on writemask result
k	writemask used as a selector
a	first source vector element

_mm_mask_set1_epi8

```
__m128i _mm_mask_set1_epi8(__m128i src, __mmask16 k, char a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpbroadcastb

Broadcast 8-bit integer *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_set1_epi8

```
__m128i _mm_maskz_set1_epi8(__mmask16 k, char a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpbroadcastb

Broadcast 8-bit integer *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_set1_epi8

```
__m256i _mm256_mask_set1_epi8(__m256i src, __mmask32 k, char a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpbroadcastb

Broadcast 8-bit integer *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_set1_epi8

```
__m256i _mm256_maskz_set1_epi8(__mmask32 k, char a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpbroadcastb

Broadcast 8-bit integer *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_set1_epi8

```
__m512i _mm512_mask_set1_epi8(__m512i src, __mmask64 k, char a)
```

CPUID Flags: AVX512BW

Instruction(s): vpbroadcastb

Broadcast 8-bit integer *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_set1_epi8

```
__m512i _mm512_maskz_set1_epi8(__mmask64 k, char a)
```

CPUID Flags: AVX512BW

Instruction(s): vpbroadcastb

Broadcast 8-bit integer *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_set1_epi32

```
__m128i _mm_mask_set1_epi32(__m128i src, __mmask8 k, int a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpbroadcastd

Broadcast 32-bit integer *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_set1_epi32

```
__m128i _mm_maskz_set1_epi32(__mmask8 k, int a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpbroadcastd

Broadcast 32-bit integer *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_set1_epi32

```
__m256i _mm256_mask_set1_epi32(__m256i src, __mmask8 k, int a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpbroadcastd

Broadcast 32-bit integer *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_set1_epi32

```
__m256i _mm256_maskz_set1_epi32(__mmask8 k, int a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpbroadcastd

Broadcast 32-bit integer *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_set1_epi64

```
__m128i _mm_mask_set1_epi64(__m128i src, __mmask8 k, __int64 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpbroadcastq

Broadcast 64-bit integer *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_set1_epi64

```
__m128i _mm_maskz_set1_epi64(__mmask8 k, __int64 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpbroadcastq

Broadcast 64-bit integer *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_set1_epi64

```
__m256i _mm256_mask_set1_epi64(__m256i src, __mmask8 k, __int64 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpbroadcastq

Broadcast 64-bit integer *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_set1_epi64

```
__m256i _mm256_maskz_set1_epi64(__mmask8 k, __int64 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpbroadcastq

Broadcast 64-bit integer *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_set1_epi16

```
__m128i _mm_mask_set1_epi16(__m128i src, __mmask8 k, short a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpbroadcastw

Broadcast the low packed 16-bit integer from *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_set1_epi16

```
__m128i _mm_maskz_set1_epi16(__mmask8 k, short a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpbroadcastw

Broadcast the low packed 16-bit integer from *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_set1_epi16

```
__m256i _mm256_mask_set1_epi16(__m256i src, __mmask16 k, short a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpbroadcastw

Broadcast the low packed 16-bit integer from *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_set1_epi16

```
__m256i _mm256_maskz_set1_epi16(__mmask16 k, short a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpbroadcastw

Broadcast the low packed 16-bit integer from *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_set1_epi16

```
__m512i _mm512_mask_set1_epi16(__m512i src, __mmask32 k, short a)
```

CPUID Flags: AVX512BW

Instruction(s): vpbroadcastw

Broadcast the low packed 16-bit integer from *a* to all elements of the return value using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_set1_epi16

```
__m512i _mm512_maskz_set1_epi16(__mmask32 k, short a)
```

CPUID Flags: AVX512BW

Instruction(s): vpbroadcastw

Broadcast the low packed 16-bit integer from *a* to all elements of the return value using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

Intrinsics for Shift Operations

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `zmmintrin.h` header file.
To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

variable	definition
src	source element to use based on writemask result
k	writemask used as a selector
a	first source vector element
b	second source vector element

_mm_mask_rol_epi32

```
__m128i _mm_mask_rol_epi32(__m128i src, __mmask8 k, __m128i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprold

Rotate the bits in each packed 32-bit integer in *a* to the left by the number of bits specified in *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_rol_epi32

```
__m128i _mm_maskz_rol_epi32(__mmask8 k, __m128i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprold

Rotate the bits in each packed 32-bit integer in *a* to the left by the number of bits specified in *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_rol_epi32

```
__m128i _mm_rol_epi32(__m128i a, int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprold

Rotate the bits in each packed 32-bit integer in *a* to the left by the number of bits specified in *imm*, and return the results.

_mm256_mask_rol_epi32

```
__m256i _mm256_mask_rol_epi32(__m256i src, __mmask8 k, __m256i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprold

Rotate the bits in each packed 32-bit integer in *a* to the left by the number of bits specified in *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_rol_epi32

```
__m256i _mm256_maskz_rol_epi32(__mmask8 k, __m256i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprold

Rotate the bits in each packed 32-bit integer in *a* to the left by the number of bits specified in *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_rol_epi32

```
__m256i _mm256_rol_epi32(__m256i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprold

Rotate the bits in each packed 32-bit integer in *a* to the left by the number of bits specified in *imm*, and return the results.

_mm_mask_rol_epi64

```
__m128i _mm_mask_rol_epi64(__m128i src, __mmask8 k, __m128i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolq

Rotate the bits in each packed 64-bit integer in *a* to the left by the number of bits specified in *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_rol_epi64

```
__m128i _mm_maskz_rol_epi64(__mmask8 k, __m128i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolq

Rotate the bits in each packed 64-bit integer in *a* to the left by the number of bits specified in *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_rol_epi64

```
__m128i _mm_rol_epi64(__m128i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolq

Rotate the bits in each packed 64-bit integer in *a* to the left by the number of bits specified in *imm*, and return the results.

_mm256_mask_rol_epi64

```
__m256i _mm256_mask_rol_epi64(__m256i src, __mmask8 k, __m256i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolq

Rotate the bits in each packed 64-bit integer in *a* to the left by the number of bits specified in *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_rol_epi64

```
__m256i _mm256_maskz_rol_epi64(__mmask8 k, __m256i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolq

Rotate the bits in each packed 64-bit integer in *a* to the left by the number of bits specified in *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_rol_epi64

```
__m256i _mm256_rol_epi64(__m256i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolq

Rotate the bits in each packed 64-bit integer in *a* to the left by the number of bits specified in *imm*, and return the results.

_mm_mask_rolv_epi32

```
__m128i _mm_mask_rolv_epi32(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolvd

Rotate the bits in each packed 32-bit integer in *a* to the left by the number of bits specified in the corresponding element of *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_rolv_epi32

```
__m128i _mm_maskz_rolv_epi32(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolvd

Rotate the bits in each packed 32-bit integer in *a* to the left by the number of bits specified in the corresponding element of *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_rolv_epi32

```
__m128i _mm_rolv_epi32(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolvd

Rotate the bits in each packed 32-bit integer in *a* to the left by the number of bits specified in the corresponding element of *b*, and return the results.

_mm256_mask_rolv_epi32

```
__m256i _mm256_mask_rolv_epi32(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolvd

Rotate the bits in each packed 32-bit integer in *a* to the left by the number of bits specified in the corresponding element of *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_rolv_epi32

```
__m256i _mm256_maskz_rolv_epi32(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolvd

Rotate the bits in each packed 32-bit integer in *a* to the left by the number of bits specified in the corresponding element of *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_rolv_epi32

```
__m256i _mm256_rolv_epi32(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolvd

Rotate the bits in each packed 32-bit integer in *a* to the left by the number of bits specified in the corresponding element of *b*, and return the results.

_mm_mask_rolv_epi64

```
__m128i _mm_mask_rolv_epi64(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolvq

Rotate the bits in each packed 64-bit integer in *a* to the left by the number of bits specified in the corresponding element of *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_rolv_epi64

```
__m128i _mm_maskz_rolv_epi64(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolvq

Rotate the bits in each packed 64-bit integer in *a* to the left by the number of bits specified in the corresponding element of *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_rolv_epi64

```
__m128i _mm_rolv_epi64(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolvq

Rotate the bits in each packed 64-bit integer in *a* to the left by the number of bits specified in the corresponding element of *b*, and return the results.

_mm256_mask_rolv_epi64

```
__m256i _mm256_mask_rolv_epi64(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolvq

Rotate the bits in each packed 64-bit integer in *a* to the left by the number of bits specified in the corresponding element of *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_rolv_epi64

```
__m256i _mm256_maskz_rolv_epi64(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolvq

Rotate the bits in each packed 64-bit integer in *a* to the left by the number of bits specified in the corresponding element of *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_rolv_epi64

```
__m256i _mm256_rolv_epi64(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprolvq

Rotate the bits in each packed 64-bit integer in *a* to the left by the number of bits specified in the corresponding element of *b*, and return the results.

_mm_mask_ror_epi32

```
__m128i _mm_mask_ror_epi32(__m128i src, __mmask8 k, __m128i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprord

Rotate the bits in each packed 32-bit integer in *a* to the right by the number of bits specified in *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_ror_epi32

```
__m128i _mm_maskz_ror_epi32(__mmask8 k, __m128i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprord

Rotate the bits in each packed 32-bit integer in *a* to the right by the number of bits specified in *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_ror_epi32

```
__m128i _mm_ror_epi32(__m128i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprord

Rotate the bits in each packed 32-bit integer in *a* to the right by the number of bits specified in *imm*, and return the results.

_mm256_mask_ror_epi32

```
__m256i _mm256_mask_ror_epi32(__m256i src, __mmask8 k, __m256i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprord

Rotate the bits in each packed 32-bit integer in *a* to the right by the number of bits specified in *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_ror_epi32

```
__m256i _mm256_maskz_ror_epi32(__mmask8 k, __m256i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprord

Rotate the bits in each packed 32-bit integer in *a* to the right by the number of bits specified in *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_ror_epi32

```
__m256i _mm256_ror_epi32(__m256i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprord

Rotate the bits in each packed 32-bit integer in *a* to the right by the number of bits specified in *imm*, and return the results.

_mm_mask_ror_epi64

```
__m128i _mm_mask_ror_epi64(__m128i src, __mmask8 k, __m128i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprorq

Rotate the bits in each packed 64-bit integer in *a* to the right by the number of bits specified in *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_ror_epi64

```
__m128i _mm_maskz_ror_epi64(__mmask8 k, __m128i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprorq

Rotate the bits in each packed 64-bit integer in *a* to the right by the number of bits specified in *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_ror_epi64

```
__m128i _mm_ror_epi64(__m128i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprorq

Rotate the bits in each packed 64-bit integer in *a* to the right by the number of bits specified in *imm*, and return the results.

_mm256_mask_ror_epi64

```
__m256i _mm256_mask_ror_epi64(__m256i src, __mmask8 k, __m256i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprorq

Rotate the bits in each packed 64-bit integer in *a* to the right by the number of bits specified in *imm*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_ror_epi64

```
__m256i _mm256_maskz_ror_epi64(__mmask8 k, __m256i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprorq

Rotate the bits in each packed 64-bit integer in *a* to the right by the number of bits specified in *imm*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_ror_epi64

```
__m256i _mm256_ror_epi64(__m256i a, const int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprorq

Rotate the bits in each packed 64-bit integer in *a* to the right by the number of bits specified in *imm*, and return the results.

_mm_mask_rorv_epi32

```
__m128i _mm_mask_rorv_epi32(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprorvd

Rotate the bits in each packed 32-bit integer in *a* to the right by the number of bits specified in the corresponding element of *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_rorv_epi32

```
__m128i _mm_maskz_rorv_epi32(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprorvd

Rotate the bits in each packed 32-bit integer in *a* to the right by the number of bits specified in the corresponding element of *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_rorv_epi32

```
__m128i _mm_rorv_epi32(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprorvd

Rotate the bits in each packed 32-bit integer in *a* to the right by the number of bits specified in the corresponding element of *b*, and return the results.

_mm256_mask_rorv_epi32

```
__m256i _mm256_mask_rorv_epi32(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprorvd

Rotate the bits in each packed 32-bit integer in *a* to the right by the number of bits specified in the corresponding element of *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_rorv_epi32

```
__m256i _mm256_maskz_rorv_epi32(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprorvd

Rotate the bits in each packed 32-bit integer in *a* to the right by the number of bits specified in the corresponding element of *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_rorv_epi32

```
__m256i _mm256_rorv_epi32(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprorvd

Rotate the bits in each packed 32-bit integer in *a* to the right by the number of bits specified in the corresponding element of *b*, and return the results.

_mm_mask_rorv_epi64

```
__m128i _mm_mask_rorv_epi64(__m128i src, __mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprorvq

Rotate the bits in each packed 64-bit integer in *a* to the right by the number of bits specified in the corresponding element of *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_rorv_epi64

```
__m128i _mm_maskz_rorv_epi64(__mmask8 k, __m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprorvq

Rotate the bits in each packed 64-bit integer in *a* to the right by the number of bits specified in the corresponding element of *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_rorv_epi64

```
__m128i _mm_rorv_epi64(__m128i a, __m128i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprorvq

Rotate the bits in each packed 64-bit integer in *a* to the right by the number of bits specified in the corresponding element of *b*, and return the results.

_mm256_mask_rorv_epi64

```
__m256i _mm256_mask_rorv_epi64(__m256i src, __mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprorvq

Rotate the bits in each packed 64-bit integer in *a* to the right by the number of bits specified in the corresponding element of *b*, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_rorv_epi64

```
__m256i _mm256_maskz_rorv_epi64(__mmask8 k, __m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprorvq

Rotate the bits in each packed 64-bit integer in *a* to the right by the number of bits specified in the corresponding element of *b*, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_rorv_epi64

```
__m256i _mm256_rorv_epi64(__m256i a, __m256i b)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vprorvq

Rotate the bits in each packed 64-bit integer in *a* to the right by the number of bits specified in the corresponding element of *b*, and return the results.

_mm_mask_sll_epi32

```
__m128i _mm_mask_sll_epi32(__m128i src, __mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpslld

Shift packed 32-bit integers in *a* left by *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_mask_slli_epi32

```
__m128i _mm_mask_slli_epi32(__m128i src, __mmask8 k, __m128i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpslld

Shift packed 32-bit integers in *a* left by *imm* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_sll_epi32

```
__m128i _mm_maskz_sll_epi32(__mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpslld

Shift packed 32-bit integers in *a* left by *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_maskz_slli_epi32

```
__m128i _mm_maskz_slli_epi32(__mmask8 k, __m128i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpslld

Shift packed 32-bit integers in *a* left by *imm* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_sll_epi32

```
__m256i _mm256_mask_sll_epi32(__m256i src, __mmask8 k, __m256i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpslld

Shift packed 32-bit integers in *a* left by *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_mask_slli_epi32

```
__m256i _mm256_mask_slli_epi32(__m256i src, __mmask8 k, __m256i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpslld

Shift packed 32-bit integers in *a* left by *imm* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_sll_epi32

```
__m256i _mm256_maskz_sll_epi32(__mmask8 k, __m256i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpslld

Shift packed 32-bit integers in *a* left by *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_maskz_slli_epi32

```
__m256i _mm256_maskz_slli_epi32(__mmask8 k, __m256i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpslld

Shift packed 32-bit integers in *a* left by *imm* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_bslli_epi128

```
__m512i _mm512_bslli_epi128(__m512i a, int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpslldq

Shift 128-bit lanes in *a* left by *imm* bytes while shifting in zeros, and return the results.

_mm_mask_sll_epi64

```
__m128i _mm_mask_sll_epi64(__m128i src, __mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllq

Shift packed 64-bit integers in *a* left by *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_mask_slli_epi64

```
__m128i _mm_mask_slli_epi64(__m128i src, __mmask8 k, __m128i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllq

Shift packed 64-bit integers in *a* left by *imm* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_sll_epi64

```
__m128i _mm_maskz_sll_epi64(__mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllq

Shift packed 64-bit integers in *a* left by *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_maskz_slli_epi64

```
__m128i _mm_maskz_slli_epi64(__mmask8 k, __m128i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllq

Shift packed 64-bit integers in *a* left by *imm* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_sll_epi64

```
__m256i _mm256_mask_sll_epi64(__m256i src, __mmask8 k, __m256i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllq

Shift packed 64-bit integers in *a* left by *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_mask_slli_epi64

```
__m256i _mm256_mask_slli_epi64(__m256i src, __mmask8 k, __m256i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllq

Shift packed 64-bit integers in *a* left by *imm* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_sll_epi64

```
__m256i _mm256_maskz_sll_epi64(__mmask8 k, __m256i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllq

Shift packed 64-bit integers in *a* left by *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_maskz_slli_epi64

```
__m256i _mm256_maskz_slli_epi64(__mmask8 k, __m256i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllq

Shift packed 64-bit integers in *a* left by *imm* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_sllv_epi32

```
__m128i _mm_mask_sllv_epi32(__m128i src, __mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllvd

Shift packed 32-bit integers in *a* left by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_sllv_epi32

```
__m128i _mm_maskz_sllv_epi32(__mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllvd

Shift packed 32-bit integers in *a* left by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_sllv_epi32

```
__m256i _mm256_mask_sllv_epi32(__m256i src, __mmask8 k, __m256i a, __m256i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllvd

Shift packed 32-bit integers in *a* left by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_sllv_epi32

```
__m256i _mm256_maskz_sllv_epi32(__mmask8 k, __m256i a, __m256i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllvd

Shift packed 32-bit integers in *a* left by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_sllv_epi64

```
__m128i _mm_mask_sllv_epi64(__m128i src, __mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllvq

Shift packed 64-bit integers in *a* left by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_sllv_epi64

```
__m128i _mm_maskz_sllv_epi64(__mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllvq

Shift packed 64-bit integers in *a* left by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_sllv_epi64

```
__m256i _mm256_mask_sllv_epi64(__m256i src, __mmask8 k, __m256i a, __m256i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllvq

Shift packed 64-bit integers in *a* left by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_sllv_epi64

```
__m256i _mm256_maskz_sllv_epi64(__mmask8 k, __m256i a, __m256i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsllvq

Shift packed 64-bit integers in *a* left by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_sllv_epi16

```
__m128i _mm_mask_sllv_epi16(__m128i src, __mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsllvw

Shift packed 16-bit integers in *a* left by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_sllv_epi16

```
__m128i _mm_maskz_sllv_epi16(__mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsllvw

Shift packed 16-bit integers in *a* left by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_sllv_epi16

```
__m128i _mm_sllv_epi16(__m128i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsllvw

Shift packed 16-bit integers in *a* left by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results.

_mm256_mask_sllv_epi16

```
__m256i _mm256_mask_sllv_epi16(__m256i src, __mmask16 k, __m256i a, __m256i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsllvw

Shift packed 16-bit integers in *a* left by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_sllv_epi16

```
__m256i _mm256_maskz_sllv_epi16(__mmask16 k, __m256i a, __m256i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsllvw

Shift packed 16-bit integers in *a* left by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_sllv_epi16

```
__m256i _mm256_sllv_epi16(__m256i a, __m256i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsllvw

Shift packed 16-bit integers in *a* left by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results.

_mm512_mask_sllv_epi16

```
__m512i _mm512_mask_sllv_epi16(__m512i src, __mmask32 k, __m512i a, __m512i count)
```

CPUID Flags: AVX512BW

Instruction(s): vpsllvw

Shift packed 16-bit integers in *a* left by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_sllv_epi16

```
__m512i _mm512_maskz_sllv_epi16(__mmask32 k, __m512i a, __m512i count)
```

CPUID Flags: AVX512BW

Instruction(s): vpsllvw

Shift packed 16-bit integers in *a* left by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_sllv_epi16

```
__m512i _mm512_sllv_epi16(__m512i a, __m512i count)
```

CPUID Flags: AVX512BW

Instruction(s): vpsllvw

Shift packed 16-bit integers in *a* left by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results.

_mm_mask_sll_epi16

```
__m128i _mm_mask_sll_epi16(__m128i src, __mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsllw

Shift packed 16-bit integers in *a* left by *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_mask_slli_epi16

```
__m128i _mm_mask_slli_epi16(__m128i src, __mmask8 k, __m128i a, unsigned int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsllw

Shift packed 16-bit integers in *a* left by *imm* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_sll_epi16

```
__m128i _mm_maskz_sll_epi16(__mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsllw

Shift packed 16-bit integers in *a* left by *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_maskz_slli_epi16

```
__m128i _mm_maskz_slli_epi16(__mmask8 k, __m128i a, unsigned int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsllw

Shift packed 16-bit integers in *a* left by *imm* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_sll_epi16

```
__m256i _mm256_mask_sll_epi16(__m256i src, __mmask16 k, __m256i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsllw

Shift packed 16-bit integers in *a* left by *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_mask_slli_epi16

```
__m256i _mm256_mask_slli_epi16(__m256i src, __mmask16 k, __m256i a, unsigned int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsllw

Shift packed 16-bit integers in *a* left by *imm* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_sll_epi16

```
__m256i _mm256_maskz_sll_epi16(__mmask16 k, __m256i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsllw

Shift packed 16-bit integers in *a* left by *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_maskz_slli_epi16

```
__m256i _mm256_maskz_slli_epi16(__mmask16 k, __m256i a, unsigned int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsllw

Shift packed 16-bit integers in *a* left by *imm* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_sll_epi16

```
__m512i _mm512_mask_sll_epi16(__m512i src, __mmask32 k, __m512i a, __m128i count)
```

CPUID Flags: AVX512BW

Instruction(s): vpsllw

Shift packed 16-bit integers in *a* left by *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_mask_slli_epi16

```
__m512i _mm512_mask_slli_epi16(__m512i src, __mmask32 k, __m512i a, unsigned int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpsllw

Shift packed 16-bit integers in *a* left by *imm* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_sll_epi16

```
__m512i _mm512_maskz_sll_epi16(__mmask32 k, __m512i a, __m128i count)
```

CPUID Flags: AVX512BW

Instruction(s): vpsllw

Shift packed 16-bit integers in *a* left by *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_maskz_slli_epi16

```
__m512i _mm512_maskz_slli_epi16(__mmask32 k, __m512i a, unsigned int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpsllw

Shift packed 16-bit integers in *a* left by *imm* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_sll_epi16

```
__m512i _mm512_sll_epi16(__m512i a, __m128i count)
```

CPUID Flags: AVX512BW

Instruction(s): vpsllw

Shift packed 16-bit integers in *a* left by *count* while shifting in zeros, and return the results.

_mm512_slli_epi16

```
__m512i _mm512_slli_epi16(__m512i a, unsigned int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpsllw

Shift packed 16-bit integers in *a* left by *imm* while shifting in zeros, and return the results.

_mm_mask_sra_epi32

```
__m128i _mm_mask_sra_epi32(__m128i src, __mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrad

Shift packed 32-bit integers in *a* right by *count* while shifting in sign bits, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_mask_srai_epi32

```
__m128i _mm_mask_srai_epi32(__m128i src, __mmask8 k, __m128i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrad

Shift packed 32-bit integers in *a* right by *imm* while shifting in sign bits, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_sra_epi32

```
__m128i _mm_maskz_sra_epi32(__mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrad

Shift packed 32-bit integers in *a* right by *count* while shifting in sign bits, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_maskz_srai_epi32

```
__m128i _mm_maskz_srai_epi32(__mmask8 k, __m128i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrad

Shift packed 32-bit integers in *a* right by *imm* while shifting in sign bits, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_sra_epi32

```
__m256i _mm256_mask_sra_epi32(__m256i src, __mmask8 k, __m256i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrad

Shift packed 32-bit integers in *a* right by *count* while shifting in sign bits, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_mask_srai_epi32

```
__m256i _mm256_mask_srai_epi32(__m256i src, __mmask8 k, __m256i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrad

Shift packed 32-bit integers in *a* right by *imm* while shifting in sign bits, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_sra_epi32

```
__m256i _mm256_maskz_sra_epi32(__mmask8 k, __m256i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrad

Shift packed 32-bit integers in *a* right by *count* while shifting in sign bits, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_maskz_srai_epi32

```
__m256i _mm256_maskz_srai_epi32(__mmask8 k, __m256i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrad

Shift packed 32-bit integers in *a* right by *imm* while shifting in sign bits, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_sra_epi64

```
__m128i _mm_mask_sra_epi64(__m128i src, __mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsraq

Shift packed 64-bit integers in *a* right by *count* while shifting in sign bits, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_mask_srai_epi64

```
__m128i _mm_mask_srai_epi64(__m128i src, __mmask8 k, __m128i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsraq

Shift packed 64-bit integers in *a* right by *imm* while shifting in sign bits, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_sra_epi64

```
__m128i _mm_maskz_sra_epi64(__mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsraq

Shift packed 64-bit integers in *a* right by *count* while shifting in sign bits, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_maskz_srai_epi64

```
__m128i _mm_maskz_srai_epi64(__mmask8 k, __m128i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsraq

Shift packed 64-bit integers in *a* right by *imm* while shifting in sign bits, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_sra_epi64

```
__m128i _mm_sra_epi64(__m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsraq

Shift packed 64-bit integers in *a* right by *count* while shifting in sign bits, and return the results.

_mm_srai_epi64

```
__m128i _mm_srai_epi64(__m128i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsraq

Shift packed 64-bit integers in *a* right by *imm* while shifting in sign bits, and return the results.

_mm256_mask_sra_epi64

```
__m256i _mm256_mask_sra_epi64(__m256i src, __mmask8 k, __m256i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsraq

Shift packed 64-bit integers in *a* right by *count* while shifting in sign bits, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_mask_srai_epi64

```
__m256i _mm256_mask_srai_epi64(__m256i src, __mmask8 k, __m256i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsraq

Shift packed 64-bit integers in *a* right by *imm* while shifting in sign bits, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_sra_epi64

```
__m256i _mm256_maskz_sra_epi64(__mmask8 k, __m256i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsraq

Shift packed 64-bit integers in *a* right by *count* while shifting in sign bits, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_maskz_srai_epi64

```
__m256i _mm256_maskz_srai_epi64(__mmask8 k, __m256i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsraq

Shift packed 64-bit integers in *a* right by *imm* while shifting in sign bits, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_sra_epi64

```
__m256i _mm256_sra_epi64(__m256i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsraq

Shift packed 64-bit integers in *a* right by *count* while shifting in sign bits, and return the results.

_mm256_srai_epi64

```
__m256i _mm256_srai_epi64(__m256i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsraq

Shift packed 64-bit integers in *a* right by *imm* while shifting in sign bits, and return the results.

_mm_mask_srav_epi32

```
__m128i _mm_mask_srav_epi32(__m128i src, __mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsravd

Shift packed 32-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in sign bits, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_srav_epi32

```
__m128i _mm_maskz_srav_epi32(__mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsravd

Shift packed 32-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in sign bits, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_srav_epi32

```
__m256i _mm256_mask_srav_epi32(__m256i src, __mmask8 k, __m256i a, __m256i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsravd

Shift packed 32-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in sign bits, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_srav_epi32

```
__m256i _mm256_maskz_srav_epi32(__mmask8 k, __m256i a, __m256i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsravd

Shift packed 32-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in sign bits, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_srav_epi64

```
__m128i _mm_mask_srav_epi64(__m128i src, __mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsravq

Shift packed 64-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in sign bits, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_srav_epi64

```
__m128i _mm_maskz_srav_epi64(__mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsravq

Shift packed 64-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in sign bits, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_srav_epi64

```
__m128i _mm_srav_epi64(__m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsravq

Shift packed 64-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in sign bits, and return the results.

_mm256_mask_srav_epi64

```
__m256i _mm256_mask_srav_epi64(__m256i src, __mmask8 k, __m256i a, __m256i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsravq

Shift packed 64-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in sign bits, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_srav_epi64

```
__m256i _mm256_maskz_srav_epi64(__mmask8 k, __m256i a, __m256i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsravq

Shift packed 64-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in sign bits, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_srav_epi64

```
__m256i _mm256_srav_epi64(__m256i a, __m256i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsravq

Shift packed 64-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in sign bits, and return the results.

_mm_mask_srav_epi16

```
__m128i _mm_mask_srav_epi16(__m128i src, __mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsravw

Shift packed 16-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in sign bits, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_srav_epi16

```
__m128i _mm_maskz_srav_epi16(__mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsravw

Shift packed 16-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in sign bits, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_srav_epi16

```
__m128i _mm_srav_epi16(__m128i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsravw

Shift packed 16-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in sign bits, and return the results.

_mm256_mask_srav_epi16

```
__m256i _mm256_mask_srav_epi16(__m256i src, __mmask16 k, __m256i a, __m256i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsravw

Shift packed 16-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in sign bits, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_srav_epi16

```
__m256i _mm256_maskz_srav_epi16(__mmask16 k, __m256i a, __m256i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsravw

Shift packed 16-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in sign bits, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_srav_epi16

```
__m256i _mm256_srav_epi16(__m256i a, __m256i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsravw

Shift packed 16-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in sign bits, and return the results.

_mm512_mask_srav_epi16

```
__m512i _mm512_mask_srav_epi16(__m512i src, __mmask32 k, __m512i a, __m512i count)
```

CPUID Flags: AVX512BW

Instruction(s): vpsravw

Shift packed 16-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in sign bits, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_srav_epi16

```
__m512i _mm512_maskz_srav_epi16(__mmask32 k, __m512i a, __m512i count)
```

CPUID Flags: AVX512BW

Instruction(s): vpsravw

Shift packed 16-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in sign bits, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_srav_epi16

```
__m512i _mm512_srav_epi16(__m512i a, __m512i count)
```

CPUID Flags: AVX512BW

Instruction(s): vpsravw

Shift packed 16-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in sign bits, and return the results.

_mm_mask_sra_epi16

```
__m128i _mm_mask_sra_epi16(__m128i src, __mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsraw

Shift packed 16-bit integers in *a* right by *count* while shifting in sign bits, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_mask_srai_epi16

```
__m128i _mm_mask_srai_epi16(__m128i src, __mmask8 k, __m128i a, unsigned int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsraw

Shift packed 16-bit integers in *a* right by *imm* while shifting in sign bits, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_sra_epi16

```
__m128i _mm_maskz_sra_epi16(__mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsraw

Shift packed 16-bit integers in *a* right by *count* while shifting in sign bits, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_maskz_srai_epi16

```
__m128i _mm_maskz_srai_epi16(__mmask8 k, __m128i a, unsigned int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsraw

Shift packed 16-bit integers in *a* right by *imm* while shifting in sign bits, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_sra_epi16

```
__m256i _mm256_mask_sra_epi16(__m256i src, __mmask16 k, __m256i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsraw

Shift packed 16-bit integers in *a* right by *count* while shifting in sign bits, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_mask_srai_epi16

```
__m256i _mm256_mask_srai_epi16(__m256i src, __mmask16 k, __m256i a, unsigned int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsraw

Shift packed 16-bit integers in *a* right by *imm* while shifting in sign bits, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_sra_epi16

```
__m256i _mm256_maskz_sra_epi16(__mmask16 k, __m256i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsraw

Shift packed 16-bit integers in *a* right by *count* while shifting in sign bits, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_maskz_srai_epi16

```
__m256i _mm256_maskz_srai_epi16(__mmask16 k, __m256i a, unsigned int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsraw

Shift packed 16-bit integers in *a* right by *imm* while shifting in sign bits, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_sra_epi16

```
__m512i _mm512_mask_sra_epi16(__m512i src, __mmask32 k, __m512i a, __m128i count)
```

CPUID Flags: AVX512BW

Instruction(s): vpsraw

Shift packed 16-bit integers in *a* right by *count* while shifting in sign bits, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_mask_srai_epi16

```
__m512i _mm512_mask_srai_epi16(__m512i src, __mmask32 k, __m512i a, unsigned int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpsraw

Shift packed 16-bit integers in *a* right by *imm* while shifting in sign bits, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_sra_epi16

```
__m512i _mm512_maskz_sra_epi16(__mmask32 k, __m512i a, __m128i count)
```

CPUID Flags: AVX512BW

Instruction(s): vpsraw

Shift packed 16-bit integers in *a* right by *count* while shifting in sign bits, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_maskz_srai_epi16

```
__m512i _mm512_maskz_srai_epi16(__mmask32 k, __m512i a, unsigned int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpsraw

Shift packed 16-bit integers in *a* right by *imm* while shifting in sign bits, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_sra_epi16

```
__m512i _mm512_sra_epi16(__m512i a, __m128i count)
```

CPUID Flags: AVX512BW

Instruction(s): vpsraw

Shift packed 16-bit integers in *a* right by *count* while shifting in sign bits, and return the results.

_mm512_srai_epi16

```
__m512i _mm512_srai_epi16(__m512i a, unsigned int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpsraw

Shift packed 16-bit integers in *a* right by *imm* while shifting in sign bits, and return the results.

_mm_mask_srl_epi32

```
__m128i _mm_mask_srl_epi32(__m128i src, __mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrld

Shift packed 32-bit integers in *a* right by *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_mask_srli_epi32

```
__m128i _mm_mask_srli_epi32(__m128i src, __mmask8 k, __m128i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrld

Shift packed 32-bit integers in *a* right by *imm* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_srl_epi32

```
__m128i _mm_maskz_srl_epi32(__mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrld

Shift packed 32-bit integers in *a* right by *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_maskz_srli_epi32

```
__m128i _mm_maskz_srli_epi32(__mmask8 k, __m128i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrld

Shift packed 32-bit integers in *a* right by *imm* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_srl_epi32

```
__m256i _mm256_mask_srl_epi32(__m256i src, __mmask8 k, __m256i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrld

Shift packed 32-bit integers in *a* right by *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_mask_srli_epi32

```
__m256i _mm256_mask_srli_epi32(__m256i src, __mmask8 k, __m256i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrld

Shift packed 32-bit integers in *a* right by *imm* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_srl_epi32

```
__m256i _mm256_maskz_srl_epi32(__mmask8 k, __m256i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrld

Shift packed 32-bit integers in *a* right by *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_maskz_srli_epi32

```
__m256i _mm256_maskz_srli_epi32(__mmask8 k, __m256i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrld

Shift packed 32-bit integers in *a* right by *imm* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_bsrli_epi128

```
__m512i _mm512_bsrli_epi128(__m512i a, int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpsrldq

Shift 128-bit lanes in *a* right by *imm* bytes while shifting in zeros, and return the results.

_mm_mask_srl_epi64

```
__m128i _mm_mask_srl_epi64(__m128i src, __mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrlq

Shift packed 64-bit integers in *a* right by *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_mask_srli_epi64

```
__m128i _mm_mask_srli_epi64(__m128i src, __mmask8 k, __m128i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrlq

Shift packed 64-bit integers in *a* right by *imm* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_srl_epi64

```
__m128i _mm_maskz_srl_epi64(__mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrlq

Shift packed 64-bit integers in *a* right by *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_maskz_srli_epi64

```
__m128i _mm_maskz_srli_epi64(__mmask8 k, __m128i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrlq

Shift packed 64-bit integers in *a* right by *imm* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_srl_epi64

```
__m256i _mm256_mask_srl_epi64(__m256i src, __mmask8 k, __m256i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrlq

Shift packed 64-bit integers in *a* right by *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_mask_srli_epi64

```
__m256i _mm256_mask_srli_epi64(__m256i src, __mmask8 k, __m256i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrlq

Shift packed 64-bit integers in *a* right by *imm* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_srl_epi64

```
__m256i _mm256_maskz_srl_epi64(__mmask8 k, __m256i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrlq

Shift packed 64-bit integers in *a* right by *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_maskz_srli_epi64

```
__m256i _mm256_maskz_srli_epi64(__mmask8 k, __m256i a, unsigned int imm)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrlq

Shift packed 64-bit integers in *a* right by *imm* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_srlv_epi32

```
__m128i _mm_mask_srlv_epi32(__m128i src, __mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrlvd

Shift packed 32-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_srlv_epi32

```
__m128i _mm_maskz_srlv_epi32(__mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrlvd

Shift packed 32-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_srlv_epi32

```
__m256i _mm256_mask_srlv_epi32(__m256i src, __mmask8 k, __m256i a, __m256i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrlvd

Shift packed 32-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_srlv_epi32

```
__m256i _mm256_maskz_srlv_epi32(__mmask8 k, __m256i a, __m256i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrlvd

Shift packed 32-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_srlv_epi64

```
__m128i _mm_mask_srlv_epi64(__m128i src, __mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrlvq

Shift packed 64-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_srlv_epi64

```
__m128i _mm_maskz_srlv_epi64(__mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrlvq

Shift packed 64-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_srlv_epi64

```
__m256i _mm256_mask_srlv_epi64(__m256i src, __mmask8 k, __m256i a, __m256i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrlvq

Shift packed 64-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_srlv_epi64

```
__m256i _mm256_maskz_srlv_epi64(__mmask8 k, __m256i a, __m256i count)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpsrlvq

Shift packed 64-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_srlv_epi16

```
__m128i _mm_mask_srlv_epi16(__m128i src, __mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsrlvw

Shift packed 16-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_srlv_epi16

```
__m128i _mm_maskz_srlv_epi16(__mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsrlvw

Shift packed 16-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_srlv_epi16

```
__m128i _mm_srlv_epi16(__m128i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsrlvw

Shift packed 16-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results.

_mm256_mask_srlv_epi16

```
__m256i _mm256_mask_srlv_epi16(__m256i src, __mmask16 k, __m256i a, __m256i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsrlvw

Shift packed 16-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_srlv_epi16

```
__m256i _mm256_maskz_srlv_epi16(__mmask16 k, __m256i a, __m256i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsrlvw

Shift packed 16-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_srlv_epi16

```
__m256i _mm256_srlv_epi16(__m256i a, __m256i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsrlvw

Shift packed 16-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results.

_mm512_mask_srlv_epi16

```
__m512i _mm512_mask_srlv_epi16(__m512i src, __mmask32 k, __m512i a, __m512i count)
```

CPUID Flags: AVX512BW

Instruction(s): vpsrlvw

Shift packed 16-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_srlv_epi16

```
__m512i _mm512_maskz_srlv_epi16(__mmask32 k, __m512i a, __m512i count)
```

CPUID Flags: AVX512BW

Instruction(s): vpsrlvw

Shift packed 16-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_srlv_epi16

```
__m512i _mm512_srlv_epi16(__m512i a, __m512i count)
```

CPUID Flags: AVX512BW

Instruction(s): vpsrlvw

Shift packed 16-bit integers in *a* right by the amount specified by the corresponding element in *count* while shifting in zeros, and return the results.

_mm_mask_srl_epi16

```
__m128i _mm_mask_srl_epi16(__m128i src, __mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsrlw

Shift packed 16-bit integers in *a* right by *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_mask_srli_epi16

```
__m128i _mm_mask_srli_epi16(__m128i src, __mmask8 k, __m128i a, int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsrlw

Shift packed 16-bit integers in *a* right by *imm* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm_maskz_srl_epi16

```
__m128i _mm_maskz_srl_epi16(__mmask8 k, __m128i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsrlw

Shift packed 16-bit integers in *a* right by *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_maskz_srli_epi16

```
__m128i _mm_maskz_srli_epi16(__mmask8 k, __m128i a, int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsrlw

Shift packed 16-bit integers in *a* right by *imm* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_mask_srl_epi16

```
__m256i _mm256_mask_srl_epi16(__m256i src, __mmask16 k, __m256i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsrlw

Shift packed 16-bit integers in *a* right by *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_mask_srli_epi16

```
__m256i _mm256_mask_srli_epi16(__m256i src, __mmask16 k, __m256i a, int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsrlw

Shift packed 16-bit integers in *a* right by *imm* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm256_maskz_srl_epi16

```
__m256i _mm256_maskz_srl_epi16(__mmask16 k, __m256i a, __m128i count)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsrlw

Shift packed 16-bit integers in *a* right by *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm256_maskz_srli_epi16

```
__m256i _mm256_maskz_srli_epi16(__mmask16 k, __m256i a, int imm)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vpsrlw

Shift packed 16-bit integers in *a* right by *imm* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mask_srl_epi16

```
__m512i _mm512_mask_srl_epi16(__m512i src, __mmask32 k, __m512i a, __m128i count)
```

CPUID Flags: AVX512BW

Instruction(s): vpsrlw

Shift packed 16-bit integers in *a* right by *count* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_mask_srli_epi16

```
__m512i _mm512_mask_srli_epi16(__m512i src, __mmask32 k, __m512i a, unsigned int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpsrlw

Shift packed 16-bit integers in *a* right by *imm* while shifting in zeros, and return the results using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_srl_epi16

```
__m512i _mm512_maskz_srl_epi16(__mmask32 k, __m512i a, __m128i count)
```

CPUID Flags: AVX512BW

Instruction(s): vpsrlw

Shift packed 16-bit integers in *a* right by *count* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_maskz_srli_epi16

```
__m512i _mm512_maskz_srli_epi16(__mmask32 k, __m512i a, int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpsrlw

Shift packed 16-bit integers in *a* right by *imm* while shifting in zeros, and return the results using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_srl_epi16

```
__m512i _mm512_srl_epi16(__m512i a, __m128i count)
```

CPUID Flags: AVX512BW

Instruction(s): vpsrlw

Shift packed 16-bit integers in *a* right by *count* while shifting in zeros, and return the results.

_mm512_srli_epi16

```
__m512i _mm512_srli_epi16(__m512i a, unsigned int imm)
```

CPUID Flags: AVX512BW

Instruction(s): vpsrlw

Shift packed 16-bit integers in *a* right by *imm* while shifting in zeros, and return the results.

Intrinsics for Store Operations

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `zmmintrin.h` header file.

To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

variable	definition
base_addr	pointer to base address in memory to begin load or store operation
mem_addr	pointer to base address in memory
k	writemask used as a selector
a	first source vector element

_mm_mask_compressstoreu_pd

```
void _mm_mask_compressstoreu_pd(void* base_addr, __mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcompresspd

Contiguously store the active double-precision (64-bit) floating-point elements in *a* (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm256_mask_compressstoreu_pd

```
void _mm256_mask_compressstoreu_pd(void* base_addr, __mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcompresspd

Contiguously store the active double-precision (64-bit) floating-point elements in *a* (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm_mask_compressstoreu_ps

```
void _mm_mask_compressstoreu_ps(void* base_addr, __mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcompressps

Contiguously store the active single-precision (32-bit) floating-point elements in *a* (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm256_mask_compressstoreu_ps

```
void _mm256_mask_compressstoreu_ps(void* base_addr, __mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vcompressps

Contiguously store the active single-precision (32-bit) floating-point elements in *a* (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm_mask_store_pd

```
void _mm_mask_store_pd(void* mem_addr, __mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovapd

Store packed double-precision (64-bit) floating-point elements from *a* into memory using writemask *k*. *mem_addr* must be aligned on a 16-byte boundary or a general-protection exception may be generated.

_mm256_mask_store_pd

```
void _mm256_mask_store_pd(void* mem_addr, __mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovapd

Store packed double-precision (64-bit) floating-point elements from *a* into memory using writemask *k*. *mem_addr* must be aligned on a 32-byte boundary or a general-protection exception may be generated.

_mm_mask_store_ps

```
void _mm_mask_store_ps(void* mem_addr, __mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovaps

Store packed single-precision (32-bit) floating-point elements from *a* into memory using writemask *k*. *mem_addr* must be aligned on a 16-byte boundary or a general-protection exception may be generated.

_mm256_mask_store_ps

```
void _mm256_mask_store_ps(void* mem_addr, __mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovaps

Store packed single-precision (32-bit) floating-point elements from *a* into memory using writemask *k*. *mem_addr* must be aligned on a 32-byte boundary or a general-protection exception may be generated.

_mm_mask_storeu_pd

```
void _mm_mask_storeu_pd(void* mem_addr, __mmask8 k, __m128d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovupd

Store packed double-precision (64-bit) floating-point elements from *a* into memory using writemask *k*. *mem_addr* does not need to be aligned on any particular boundary.

_mm256_mask_storeu_pd

```
void _mm256_mask_storeu_pd(void* mem_addr, __mmask8 k, __m256d a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovupd

Store packed double-precision (64-bit) floating-point elements from *a* into memory using writemask *k*. *mem_addr* does not need to be aligned on any particular boundary.

_mm_mask_storeu_ps

```
void _mm_mask_storeu_ps(void* mem_addr, __mmask8 k, __m128 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovups

Store packed single-precision (32-bit) floating-point elements from *a* into memory using writemask *k*. *mem_addr* does not need to be aligned on any particular boundary.

_mm256_mask_storeu_ps

```
void _mm256_mask_storeu_ps(void* mem_addr, __mmask8 k, __m256 a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovups

Store packed single-precision (32-bit) floating-point elements from *a* into memory using writemask *k*. *mem_addr* does not need to be aligned on any particular boundary.

_mm_i32scatter_pd

```
void _mm_i32scatter_pd(void* base_addr, __m128i vindex, __m128d a, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscatterdpd

Scatter double-precision (64-bit) floating-point elements from *a* into memory using 32-bit indices. 64-bit elements are stored at addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*). *scale* should be 1, 2, 4 or 8.

_mm_mask_i32scatter_pd

```
void _mm_mask_i32scatter_pd(void* base_addr, __mmask8 k, __m128i vindex, __m128d a, const int
scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscatterdpd

Scatter double-precision (64-bit) floating-point elements from *a* into memory using 32-bit indices. 64-bit elements are stored at addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*) subject to mask *k* (elements are not stored when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm256_i32scatter_pd

```
void _mm256_i32scatter_pd(void* base_addr, __m128i vindex, __m256d a, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscatterdpd

Scatter double-precision (64-bit) floating-point elements from *a* into memory using 32-bit indices. 64-bit elements are stored at addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*). *scale* should be 1, 2, 4 or 8.

_mm256_mask_i32scatter_pd

```
void _mm256_mask_i32scatter_pd(void* base_addr, __mmask8 k, __m128i vindex, __m256d a, const int
scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscatterdpd

Scatter double-precision (64-bit) floating-point elements from *a* into memory using 32-bit indices. 64-bit elements are stored at addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*) subject to mask *k* (elements are not stored when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm_i32scatter_ps

```
void _mm_i32scatter_ps(void* base_addr, __m128i vindex, __m128 a, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscatterdps

Scatter single-precision (32-bit) floating-point elements from *a* into memory using 32-bit indices. 32-bit elements are stored at addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*). *scale* should be 1, 2, 4 or 8.

_mm_mask_i32scatter_ps

```
void _mm_mask_i32scatter_ps(void* base_addr, __mmask8 k, __m128i vindex, __m128 a, const int
scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscatterdps

Scatter single-precision (32-bit) floating-point elements from *a* into memory using 32-bit indices. 32-bit elements are stored at addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*) subject to mask *k* (elements are not stored when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm256_i32scatter_ps

```
void _mm256_i32scatter_ps(void* base_addr, __m256i vindex, __m256 a, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscatterdps

Scatter single-precision (32-bit) floating-point elements from *a* into memory using 32-bit indices. 32-bit elements are stored at addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*). *scale* should be 1, 2, 4 or 8.

_mm256_mask_i32scatter_ps

```
void _mm256_mask_i32scatter_ps(void* base_addr, __mmask8 k, __m256i vindex, __m256 a, const int
scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscatterdps

Scatter single-precision (32-bit) floating-point elements from *a* into memory using 32-bit indices. 32-bit elements are stored at addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*) subject to mask *k* (elements are not stored when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm_i64scatter_pd

```
void _mm_i64scatter_pd(void* base_addr, __m128i vindex, __m128d a, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscatterqpd

Scatter double-precision (64-bit) floating-point elements from *a* into memory using 64-bit indices. 64-bit elements are stored at addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*). *scale* should be 1, 2, 4 or 8.

_mm_mask_i64scatter_pd

```
void _mm_mask_i64scatter_pd(void* base_addr, __mmask8 k, __m128i vindex, __m128d a, const int
scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscatterqpd

Scatter double-precision (64-bit) floating-point elements from *a* into memory using 64-bit indices. 64-bit elements are stored at addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*) subject to mask *k* (elements are not stored when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm256_i64scatter_pd

```
void _mm256_i64scatter_pd(void* base_addr, __m256i vindex, __m256d a, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscatterqpd

Scatter double-precision (64-bit) floating-point elements from *a* into memory using 64-bit indices. 64-bit elements are stored at addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*). *scale* should be 1, 2, 4 or 8.

_mm256_mask_i64scatter_pd

```
void _mm256_mask_i64scatter_pd(void* base_addr, __mmask8 k, __m256i vindex, __m256d a, const int
scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscatterqpd

Scatter double-precision (64-bit) floating-point elements from *a* into memory using 64-bit indices. 64-bit elements are stored at addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*) subject to mask *k* (elements are not stored when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm_i64scatter_ps

```
void _mm_i64scatter_ps(void* base_addr, __m128i vindex, __m128 a, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscatterqps

Scatter single-precision (32-bit) floating-point elements from *a* into memory using 64-bit indices. 32-bit elements are stored at addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*) subject to mask *k* (elements are not stored when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm_mask_i64scatter_ps

```
void _mm_mask_i64scatter_ps(void* base_addr, __mmask8 k, __m128i vindex, __m128 a, const int
scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscatterqps

Scatter single-precision (32-bit) floating-point elements from *a* into memory using 64-bit indices. 32-bit elements are stored at addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*) subject to mask *k* (elements are not stored when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm256_i64scatter_ps

```
void _mm256_i64scatter_ps(void* base_addr, __m256i vindex, __m128 a, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscatterqps

Scatter single-precision (32-bit) floating-point elements from *a* into memory using 64-bit indices. 32-bit elements are stored at addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*) subject to mask *k* (elements are not stored when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm256_mask_i64scatter_ps

```
void _mm256_mask_i64scatter_ps(void* base_addr, __mmask8 k, __m256i vindex, __m128 a, const int
scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vscatterqps

Scatter single-precision (32-bit) floating-point elements from *a* into memory using 64-bit indices. 32-bit elements are stored at addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*) subject to mask *k* (elements are not stored when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm_mask_store_epi32

```
void _mm_mask_store_epi32(void* mem_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqa32

Store packed 32-bit integers from *a* into memory using writemask *k*. *mem_addr* must be aligned on a 16-byte boundary or a general-protection exception may be generated.

_mm256_mask_store_epi32

```
void _mm256_mask_store_epi32(void* mem_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqa32

Store packed 32-bit integers from *a* into memory using writemask *k*. *mem_addr* must be aligned on a 32-byte boundary or a general-protection exception may be generated.

_mm_mask_store_epi64

```
void _mm_mask_store_epi64(void* mem_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqa64

Store packed 64-bit integers from *a* into memory using writemask *k*. *mem_addr* must be aligned on a 16-byte boundary or a general-protection exception may be generated.

_mm256_mask_store_epi64

```
void _mm256_mask_store_epi64(void* mem_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqa64

Store packed 64-bit integers from *a* into memory using writemask *k*. *mem_addr* must be aligned on a 32-byte boundary or a general-protection exception may be generated.

_mm_mask_storeu_epi16

```
void _mm_mask_storeu_epi16(void* mem_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vmovdqu16

Store packed 16-bit integers from *a* into memory using writemask *k*. *mem_addr* does not need to be aligned on any particular boundary.

_mm256_mask_storeu_epi16

```
void _mm256_mask_storeu_epi16(void* mem_addr, __mmask16 k, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vmovdqu16

Store packed 16-bit integers from *a* into memory using writemask *k*. *mem_addr* does not need to be aligned on any particular boundary.

_mm512_mask_storeu_epi16

```
void _mm512_mask_storeu_epi16(void* mem_addr, __mmask32 k, __m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vmovdqu16

Store packed 16-bit integers from *a* into memory using writemask *k*. *mem_addr* does not need to be aligned on any particular boundary.

_mm_mask_storeu_epi32

```
void _mm_mask_storeu_epi32(void* mem_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqu32

Store packed 32-bit integers from *a* into memory using writemask *k*. *mem_addr* does not need to be aligned on any particular boundary.

_mm256_mask_storeu_epi32

```
void _mm256_mask_storeu_epi32(void* mem_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqu32

Store packed 32-bit integers from *a* into memory using writemask *k*. *mem_addr* does not need to be aligned on any particular boundary.

_mm_mask_storeu_epi64

```
void _mm_mask_storeu_epi64(void* mem_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqu64

Store packed 64-bit integers from *a* into memory using writemask *k*. *mem_addr* does not need to be aligned on any particular boundary.

_mm256_mask_storeu_epi64

```
void _mm256_mask_storeu_epi64(void* mem_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vmovdqu64

Store packed 64-bit integers from *a* into memory using writemask *k*. *mem_addr* does not need to be aligned on any particular boundary.

_mm_mask_storeu_epi8

```
void _mm_mask_storeu_epi8(void* mem_addr, __mmask16 k, __m128i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vmovdqu8

Store packed 8-bit integers from *a* into memory using writemask *k*. *mem_addr* does not need to be aligned on any particular boundary.

_mm256_mask_storeu_epi8

```
void _mm256_mask_storeu_epi8(void* mem_addr, __mmask32 k, __m256i a)
```

CPUID Flags: AVX512BW, AVX512VL

Instruction(s): vmovdqu8

Store packed 8-bit integers from *a* into memory using writemask *k*. *mem_addr* does not need to be aligned on any particular boundary.

_mm512_mask_storeu_epi8

```
void _mm512_mask_storeu_epi8(void* mem_addr, __mmask64 k, __m512i a)
```

CPUID Flags: AVX512BW

Instruction(s): vmovdqu8

Store packed 8-bit integers from *a* into memory using writemask *k*. *mem_addr* does not need to be aligned on any particular boundary.

_mm_mask_compressstoreu_epi32

```
void _mm_mask_compressstoreu_epi32(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcompressd

Contiguously store the active 32-bit integers in *a* (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm256_mask_compressstoreu_epi32

```
void _mm256_mask_compressstoreu_epi32(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcompressd

Contiguously store the active 32-bit integers in *a* (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm_mask_compressstoreu_epi64

```
void _mm_mask_compressstoreu_epi64(void* base_addr, __mmask8 k, __m128i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcompressq

Contiguously store the active 64-bit integers in *a* (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm256_mask_compressstoreu_epi64

```
void _mm256_mask_compressstoreu_epi64(void* base_addr, __mmask8 k, __m256i a)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpcompressq

Contiguously store the active 64-bit integers in *a* (those with their respective bit set in writemask *k*) to unaligned memory at *base_addr*.

_mm_i32scatter_epi32

```
void _mm_i32scatter_epi32(void* base_addr, __m128i vindex, __m128i a, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpscatterdd

Scatter 32-bit integers from *a* into memory using 32-bit indices. 32-bit elements are stored at addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*). *scale* should be 1, 2, 4 or 8.

_mm_mask_i32scatter_epi32

```
void _mm_mask_i32scatter_epi32(void* base_addr, __mmask8 k, __m128i vindex, __m128i a, const int
scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpscatterdd

Scatter 32-bit integers from *a* into memory using 32-bit indices. 32-bit elements are stored at addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*) subject to mask *k* (elements are not stored when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm256_i32scatter_epi32

```
void _mm256_i32scatter_epi32(void* base_addr, __m256i vindex, __m256i a, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpscatterdd

Scatter 32-bit integers from *a* into memory using 32-bit indices. 32-bit elements are stored at addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*). *scale* should be 1, 2, 4 or 8.

_mm256_mask_i32scatter_epi32

```
void _mm256_mask_i32scatter_epi32(void* base_addr, __mmask8 k, __m256i vindex, __m256i a, const
int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpscatterdd

Scatter 32-bit integers from *a* into memory using 32-bit indices. 32-bit elements are stored at addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*) subject to mask *k* (elements are not stored when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm_i32scatter_epi64

```
void _mm_i32scatter_epi64(void* base_addr, __m128i vindex, __m128i a, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpscatterdq

Scatter 64-bit integers from *a* into memory using 32-bit indices. 64-bit elements are stored at addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*). *scale* should be 1, 2, 4 or 8.

_mm_mask_i32scatter_epi64

```
void _mm_mask_i32scatter_epi64(void* base_addr, __mmask8 k, __m128i vindex, __m128i a, const int
scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpscatterdq

Scatter 64-bit integers from *a* into memory using 32-bit indices. 64-bit elements are stored at addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*) subject to mask *k* (elements are not stored when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm256_i32scatter_epi64

```
void _mm256_i32scatter_epi64(void* base_addr, __m128i vindex, __m256i a, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpscatterdq

Scatter 64-bit integers from *a* into memory using 32-bit indices. 64-bit elements are stored at addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*). *scale* should be 1, 2, 4 or 8.

_mm256_mask_i32scatter_epi64

```
void _mm256_mask_i32scatter_epi64(void* base_addr, __mmask8 k, __m128i vindex, __m256i a, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpscatterdq

Scatter 64-bit integers from *a* into memory using 32-bit indices. 64-bit elements are stored at addresses starting at *base_addr* and offset by each 32-bit element in *vindex* (each index is scaled by the factor in *scale*) subject to mask *k* (elements are not stored when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm_i64scatter_epi32

```
void _mm_i64scatter_epi32(void* base_addr, __m128i vindex, __m128i a, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpscatterqd

Scatter 32-bit integers from *a* into memory using 64-bit indices. 32-bit elements are stored at addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*). *scale* should be 1, 2, 4 or 8.

_mm_mask_i64scatter_epi32

```
void _mm_mask_i64scatter_epi32(void* base_addr, __mmask8 k, __m128i vindex, __m128i a, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpscatterqd

Scatter 32-bit integers from *a* into memory using 64-bit indices. 32-bit elements are stored at addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*) subject to mask *k* (elements are not stored when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm256_i64scatter_epi32

```
void _mm256_i64scatter_epi32(void* base_addr, __m256i vindex, __m128i a, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpscatterqd

Scatter 32-bit integers from *a* into memory using 64-bit indices. 32-bit elements are stored at addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*). *scale* should be 1, 2, 4 or 8.

_mm256_mask_i64scatter_epi32

```
void _mm256_mask_i64scatter_epi32(void* base_addr, __mmask8 k, __m256i vindex, __m128i a, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpscatterqd

Scatter 32-bit integers from *a* into memory using 64-bit indices. 32-bit elements are stored at addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*) subject to mask *k* (elements are not stored when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm_i64scatter_epi64

```
void _mm_i64scatter_epi64(void* base_addr, __m128i vindex, __m128i a, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpscatterqq

Scatter 64-bit integers from *a* into memory using 64-bit indices. 64-bit elements are stored at addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*). *scale* should be 1, 2, 4 or 8.

_mm_mask_i64scatter_epi64

```
void _mm_mask_i64scatter_epi64(void* base_addr, __mmask8 k, __m128i vindex, __m128i a, const int
scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpscatterqq

Scatter 64-bit integers from *a* into memory using 64-bit indices. 64-bit elements are stored at addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*) subject to mask *k* (elements are not stored when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

_mm256_i64scatter_epi64

```
void _mm256_i64scatter_epi64(void* base_addr, __m256i vindex, __m256i a, const int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpscatterqq

Scatter 64-bit integers from *a* into memory using 64-bit indices. 64-bit elements are stored at addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*). *scale* should be 1, 2, 4 or 8.

_mm256_mask_i64scatter_epi64

```
void _mm256_mask_i64scatter_epi64(void* base_addr, __mmask8 k, __m256i vindex, __m256i a, const
int scale)
```

CPUID Flags: AVX512F, AVX512VL

Instruction(s): vpscatterqq

Scatter 64-bit integers from *a* into memory using 64-bit indices. 64-bit elements are stored at addresses starting at *base_addr* and offset by each 64-bit element in *vindex* (each index is scaled by the factor in *scale*) subject to mask *k* (elements are not stored when the corresponding mask bit is not set). *scale* should be 1, 2, 4 or 8.

Intrinsics for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) Instructions

Functional Overview

Intrinsics for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) Instructions extend Intel® Advanced Vector Extensions (Intel® AVX) and Intel® Advanced Vector Extensions 2 (Intel® AVX2) by promoting most of the 256-bit SIMD instructions with 512-bit numeric processing capabilities.

The Intel® AVX-512 instructions follow the same programming model as the Intel® AVX2 instructions, providing enhanced functionality for broadcast, embedded masking to enable predication, embedded floating point rounding control, embedded floating-point fault suppression, scatter instructions, high speed math instructions, and compact representation of large displacement values. Unlike Intel® SSE and Intel® AVX, which cannot be mixed without performance penalties, the mixing of Intel® AVX and Intel® AVX-512 instructions is supported without penalty.

Intel® AVX-512 intrinsics are supported on IA-32 and Intel® 64 architectures built from 32nm process technology. They map directly to the new Intel® AVX-512 instructions and other enhanced 128-bit and 256-bit SIMD instructions.

Intel® AVX-512 Registers

512-bit Register state is managed by the operating system using `XSAVE` / `XRSTOR` / `XSAVEOPT` instructions, introduced in 45nm Intel® 64 processors (see Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2B, and Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A).

- Support for sixteen new 512-bit SIMD registers in 64-bit mode (for a total of 32 SIMD registers, representing 2K of register space, `ZMM0` through `ZMM31`).
- Support for eight new opmask registers (`k0` through `k7`) used for conditional execution and efficient merging of destination operands.

Intel® AVX registers `YMM0-YMM15` map into Intel® AVX-512 registers `ZMM0-ZMM15`, very much like Intel® SSE registers map into Intel® AVX registers. In processors with Intel® AVX-512 support, Intel® AVX and Intel® AVX2 instructions operate on the lower 128- or 256-bits of the first sixteen `ZMM` registers.

Prefix Instruction Encoding Support for Intel® AVX-512

A new encoding prefix (referred to as EVEX) to support additional vector length encoding up to 512 bits. The EVEX prefix builds upon the foundations of VEX prefix, to provide compact, efficient encoding for functionality available to VEX encoding while enhancing vector capabilities.

The Intel® AVX-512 intrinsic functions use three C data types as operands, representing the new registers used as operands to the intrinsic functions. These are `__m512`, `__m512d`, and `__m512i` data types. The `__m512` data type is used to represent the contents of the extended SSE register, the `ZMM` register, used by the Intel® AVX-512 intrinsics. The `__m512` data type can hold sixteen 32-bit floating-point values. The `__m512d` data type can hold eight 64-bit double precision floating-point values. The `__m512i` data type can hold sixty-four 8-bit, thirty-two 16-bit, sixteen 32-bit, or eight 64-bit integer values.

The compiler aligns the `__m512`, `__m512d`, and `__m512i` local and global data to 64-byte boundaries on the stack. To align `integer`, `float`, or `double` arrays, use the `__declspec(align)` statement.

Data Types for Intel® AVX-512 Intrinsics

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `zmmintrin.h` header file.
To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

Intel® AVX-512 intrinsics have vector variants that use `__m128`, `__m128i`, `__m128d`, `__m256`, `__m256i`, `__m256d`, `__m512`, `__m512i`, and `__m512d` data types.

Naming and Usage Syntax

Most Intel® AVX-512 intrinsic names use the following notational convention:

```
_mm512[_<maskprefix>]_<intrin_op>_<suffix>
```

The following table explains each item in the syntax.

`_mm512`	Prefix representing the size of the largest vector in the operation considering any of the parameters or the result.
`<maskprefix>`	When present, indicates write-masked (`_mask`) or zero-masked (`_maskz`) predication.
`<intrin_op>`	Indicates the basic operation of the intrinsic; for example, add for addition and sub for subtraction.
`<suffix>`	Denotes the type of data the instruction operates on. The first one or two letters of each suffix denote whether the data is packed (*p*), extended packed (*ep*), or scalar (*s*). The remaining letters and numbers denote the type, with notation as follows: • **s:** single-precision floating point • **d:** double-precision floating point • **i512:** signed 512-bit integer • **i256:** signed 256-bit integer • **i128:** signed 128-bit integer • **i64:** signed 64-bit integer • **u64:** unsigned 64-bit integer • **i32:** signed 32-bit integer • **u32:** unsigned 32-bit integer • **i16:** signed 16-bit integer • **u16:** unsigned 16-bit integer • **i8:** signed 8-bit integer • **u8:** unsigned 8-bit integer

Programs can pack eight double precision and sixteen single precision floating-point numbers within the 512-bit vectors, as well as eight 64-bit and sixteen 32-bit integers. This enables processing of twice the number of data elements that Intel® AVX or Intel® AVX2 can process with a single instruction and four times the capabilities of Intel® SSE.

Example: Write-Masking

Write-masking allows an intrinsic to perform its operation on selected SIMD elements of a source operand, with blending of the other elements from an additional SIMD operand. Consider the declarations below, where the write-mask *k* has a 1 in the even numbered bit positions 0, 3, 5, 7, 9, 11, 13 and 15, and a 0 in the odd numbered bit positions.

```
__m512 res, src, a, b;
__mmask16  k = 0x5555;
```

Then, given an intrinsic invocation such as this:

```
res = _mm512_mask_add_ps(src, k, a, b);
```

every even-numbered float32 element of the result *res* is computed as the sum of the corresponding elements in *a* and *b*, while every odd-numbered element is passed through (i.e., blended) from the corresponding float32 element in *src*.

Typical write-masked intrinsics are declared with a parameter order such that the values to be blended (*src* in the example above) are in the first parameter, and the write mask *k* immediately follows this parameter. Some intrinsics provide the blended values from a different SIMD parameter, for example: `_mm512_mask2_permutex2var_epi32`. In this case too, the mask will follow that parameter.

Example: Zero-Masking

Zero-masking is a simplified form of write-masking where there are no blended values. Instead result elements corresponding to zero bits in the write mask are simply set to zero. Given:

```
res = _mm512_maskz_add_ps(k, a, b);
```

the float32 elements of res corresponding to zeros in the write-mask *k*, are set to zero. The elements corresponding to ones in *k*, have the expected sum of corresponding elements in *a* and *b*.

Zero-masked intrinsics are typically declared with the write-mask as the first parameter, as there is no parameter for blended values.

Example: Embedded Rounding and Suppress All Exceptions (SAE)

Embedded rounding allows the floating point rounding mode to be explicitly specified for an individual operation, without having to modify the rounding controls in the MXCSR control register. The Suppress All Exceptions feature allows signaling of FP exceptions to be suppressed.

AVX-512 provides these capabilities on most 512-bit and scalar floating point operations. An intrinsic supporting these features will typically have "_round" in its name, for example:

```
__m512d _mm512_add_round_pd(__m512d a, __m512d b, int rounding);
```

To specify round-towards-zero and SAE, an invocation would appear as follows:

```
__m512d res, a, b;
res = _mm512_add_round_pd(a, b, _MM_FROUND_TO_ZERO | _MM_FROUND_NO_EXC);
```

Example: Embedded Broadcasting

Embedded broadcasting allows a single value to be broadcast across a source operand, without requiring an extra instruction. The "set1" family of intrinsics represent a broadcast operation, and the compiler can embed such operations into the EVEX prefix of an AVX-512 instruction. For example,

```
__m512 res, a;
res = _mm512_add_ps(a, _mm512_set1_ps(3.0f));
```

will add 3.0 to each float32 element of *a*.

variable	definition
k	writemask used as a selector
a	first source vector element

variable	definition
b	second source vector element
src	source element to use based on writemask result
round	Rounding control values; these can be one of the following (along with the `sae` suppress all exceptions flag): • `_MM_FROUND_TO_NEAREST_INT` - rounds to nearest even • `_MM_FROUND_TO_NEG_INF` - rounds to negative infinity • `_MM_FROUND_TO_POS_INF` - rounds to positive infinity • `_MM_FROUND_TO_ZERO` - rounds to zero • `_MM_FROUND_CUR_DIRECTION` - rounds using default from MXCSR register

_mm512_add_pd

```
extern __m512d __cdecl _mm512_add_pd(__m512d a, __m512d b);
```

Adds packed float64 elements in *a* and *b*, and stores the result.

_mm512_mask_add_pd

```
extern __m512d __cdecl _mm512_mask_add_pd(__m512d src, __mmask8 k, __m512d a, __m512d b);
```

Adds packed float64 elements in *a* and *b*, and stores the result using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_add_pd

```
extern __m512d __cdecl _mm512_maskz_add_pd(__mmask8 k, __m512d a, __m512d b);
```

Adds packed float64 elements in *a* and *b*, and stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_add_round_pd

```
extern __m512d __cdecl _mm512_add_round_pd(__m512d a, __m512d b, int round);
```

Adds packed float64 elements in *a* and *b* using rounding control *round*, and stores the result.

_mm512_mask_add_round_pd

```
extern __m512d __cdecl _mm512_mask_add_round_pd(__m512d src, __mmask8 k, __m512d a, __m512d b,
int round);
```

Adds packed float64 elements in *a* and *b* using rounding control *round*, and stores the result using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_add_round_pd

```
extern __m512d __cdecl _mm512_maskz_add_round_pd(__mmask8 k, __m512d a, __m512d b, int round);
```

Adds packed float64 elements in *a* and *b* using rounding control *round*, and stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_add_ps

```
extern __m512 __cdecl _mm512_add_ps(__m512 a, __m512 b);
```

Adds packed float32 elements in *a* and *b*, and stores the result.

_mm512_mask_add_ps

```
extern __m512 __cdecl _mm512_mask_add_ps(__m512 src, __mmask16 k, __m512 a, __m512 b);
```

Adds packed float32 elements in *a* and *b*, and stores the result using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_add_ps

```
extern __m512 __cdecl _mm512_maskz_add_ps(__mmask16 k, __m512 a, __m512 b);
```

Adds packed float32 elements in *a* and *b*, and stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_add_round_ps

```
extern __m512 __cdecl _mm512_add_round_ps(__m512 a, __m512 b, int round);
```

Adds packed float32 elements in *a* and *b* using rounding control *round*, and stores the result.

_mm512_mask_add_round_ps

```
extern __m512 __cdecl _mm512_mask_add_round_ps(__m512 src, __mmask16 k, __m512 a, __m512 b, int
round);
```

Adds packed float32 elements in *a* and *b* using rounding control *round*, and stores the result using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_add_round_ps

```
extern __m512 __cdecl _mm512_maskz_add_round_ps(__mmask16 k, __m512 a, __m512 b, int round);
```

Adds packed float32 elements in *a* and *b* using rounding control *round*, and stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_add_round_sd

```
extern __m128d __cdecl _mm_add_round_sd(__m128d a, __m128d b, int round);
```

Adds the lower float64 element in *a* and *b* using rounding control *round*, stores the result in the lower destination element, and copies the upper element from *a* to the upper destination element.

_mm_mask_add_round_sd

```
extern __m128d __cdecl _mm_mask_add_round_sd(__m128d src, __mmask8 k, __m128d a, __m128d b, int
round);
```

Adds the lower float64 element in *a* and *b* using rounding control *round*, stores the result in the lower destination element using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copies the upper element from *a* to the upper destination element.

_mm_maskz_add_round_sd

```
extern __m128d __cdecl _mm_maskz_add_round_sd(__mmask8 k, __m128d a, __m128d b, int round);
```

Adds the lower float64 element in *a* and *b* using rounding control *round*, stores the result in the lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies the upper element from *a* to the upper destination element.

_mm_mask_add_sd

```
extern __m128d __cdecl _mm_mask_add_sd(__m128d src, __mmask8 k, __m128d a, __m128d b);
```

Adds the lower float64 element in *a* and *b*, stores the result in the lower destination element using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copies the upper element from *a* to the upper destination element.

_mm_maskz_add_sd

```
extern __m128d __cdecl _mm_maskz_add_sd(__mmask8 k, __m128d a, __m128d b);
```

Adds the lower float64 element in *a* and *b*, stores the result in the lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies the upper element from *a* to the upper destination element.

_mm_add_round_ss

```
extern __m128 __cdecl _mm_add_round_ss(__m128 a, __m128 b, int round);
```

Add the lower float32 element in *a* and *b* using rounding control *round*, stores the result in the lower destination element, and copies the upper three packed elements from *a* to the upper destination elements.

_mm_mask_add_round_ss

```
extern __m128 __cdecl _mm_mask_add_round_ss(__m128 src, __mmask8 k, __m128 a, __m128 b, int
round);
```

Add the lower float32 element in *a* and *b* using rounding control *round*, stores the result in the lower destination element using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copies the upper three packed elements from *a* to the upper destination elements.

_mm_maskz_add_round_ss

```
extern __m128 __cdecl _mm_maskz_add_round_ss(__mmask8 k, __m128 a, __m128 b, int round);
```

Add the lower float32 element in *a* and *b* using rounding control *round*, stores the result in the lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies the upper three packed elements from *a* to the upper destination elements.

_mm_mask_add_ss

```
extern __m128 __cdecl _mm_mask_add_ss(__m128 src, __mmask8 k, __m128 a, __m128 b);
```

Add the lower float32 element in *a* and *b*, stores the result in the lower destination element using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copies the upper three packed elements from *a* to the upper destination elements.

_mm_maskz_add_ss

```
extern __m128 __cdecl _mm_maskz_add_ss(__mmask8 k, __m128 a, __m128 b);
```

Add the lower float32 element in *a* and *b*, stores the result in the lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies the upper three packed elements from *a* to the upper destination elements.

Intrinsics for Integer Addition Operations

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `zmmintrin.h` header file.
To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

Intrinsic Name	Operation	Corresponding Intel® AVX-512 Instruction
`_mm512_add_epi32`, `_mm512_mask_add_epi32`, `_mm512_maskz_add_epi32`	Add int32 vectors.	`VPADDD`
`_mm512_add_epi64`, `_mm512_mask_add_epi64`, `_mm512_maskz_add_epi64`	Add int64 vectors.	`VPADDQ`

variable	definition
k	writemask used as a selector
a	first source vector element
b	second source vector element
src	source element to use based on writemask result

_mm512_add_epi32

```
extern __m512i __cdecl _mm512_add_epi32(__m512i a, __m512i b);
```

Adds packed int32 elements in *a* and *b*, and stores the result.

_mm512_mask_add_epi32

```
extern __m512i __cdecl _mm512_mask_add_epi32(__m512i src, __mmask16 k, __m512i a, __m512i b);
```

Adds packed int32 elements in *a* and *b*, and stores the result using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_add_epi32

```
extern __m512i __cdecl _mm512_maskz_add_epi32(__mmask16 k, __m512i a, __m512i b);
```

Adds packed int32 elements in *a* and *b*, and stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_add_epi64

```
extern __m512i __cdecl _mm512_add_epi64(__m512i a, __m512i b);
```

Adds packed int64 elements in *a* and *b*, and stores the result.

_mm512_mask_add_epi64

```
extern __m512i __cdecl _mm512_mask_add_epi64(__m512i src, __mmask8 k, __m512i a, __m512i b);
```

Adds packed int64 elements in *a* and *b*, and stores the result using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_add_epi64

```
extern __m512i __cdecl _mm512_maskz_add_epi64(__mmask8 k, __m512i a, __m512i b);
```

Adds packed int64 elements in *a* and *b*, and stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

Intrinsics for Determining Minimum and Maximum Values

Intrinsics for Determining Minimum and Maximum FP Values

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `zmmintrin.h` header file.

round	Rounding control values; these can be one of the following (along with the sae suppress all exceptions flag): • _MM_FROUND_TO_NEAREST_INT - rounds to nearest even • _MM_FROUND_TO_NEG_INF - rounds to negative infinity • _MM_FROUND_TO_POS_INF - rounds to positive infinity • _MM_FROUND_TO_ZERO - rounds to zero • _MM_FROUND_CUR_DIRECTION - rounds using default from MXCSR register

_mm512_max_pd

```
extern __m512d __cdecl _mm512_max_pd(__m512d a, __m512d b);
```

Compares packed float64 elements in *a* and *b*, and stores packed maximum values.

_mm512_mask_max_pd

```
extern __m512d __cdecl _mm512_mask_max_pd(__m512d src, __mmask8 k, __m512d a, __m512d b);
```

Compares packed float64 elements in *a* and *b*, and stores packed maximum values using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_max_pd

```
extern __m512d __cdecl _mm512_maskz_max_pd(__mmask8 k, __m512d a, __m512d b);
```

Compares packed float64 elements in *a* and *b*, and stores packed maximum values using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_max_round_pd

```
extern __m512d __cdecl _mm512_max_round_pd(__m512d a, __m512d b, int round);
```

Compares packed float64 elements in *a* and *b*, and stores packed maximum values.

NOTE
Pass `__MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

_mm512_mask_max_round_pd

```
extern __m512d __cdecl _mm512_mask_max_round_pd(__m512d src, __mmask8 k, __m512d a, __m512d b,
int round);
```

Compares packed float64 elements in *a* and *b*, and stores packed maximum values using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

NOTE
Pass `__MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

_mm512_maskz_max_round_pd

```
extern __m512d __cdecl _mm512_maskz_max_round_pd(__mmask8 k, __m512d a, __m512d b, int round);
```

Compares packed float64 elements in *a* and *b*, and stores packed maximum values using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

NOTE
Pass `__MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

_mm512_max_ps

```
extern __m512 __cdecl _mm512_max_ps(__m512 a, __m512 b);
```

Compares packed float32 elements in *a* and *b*, and stores packed maximum values.

_mm512_mask_max_ps

```
extern __m512 __cdecl _mm512_mask_max_ps(__m512 src, __mmask16 k, __m512 a, __m512 b);
```

Compares packed float32 elements in *a* and *b*, and stores packed maximum values using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_max_ps

```
extern __m512 __cdecl _mm512_maskz_max_ps(__mmask16 k, __m512 a, __m512 b);
```

Compares packed float32 elements in *a* and *b*, and stores packed maximum values using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_max_round_ps

```
extern __m512 __cdecl _mm512_max_round_ps(__m512 a, __m512 b, int round);
```

Compares packed float32 elements in *a* and *b*, and stores packed maximum values.

> **NOTE**
> Pass `__MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

_mm512_mask_max_round_ps

```
extern __m512 __cdecl _mm512_mask_max_round_ps(__m512 src, __mmask16 k, __m512 a, __m512 b, int
round);
```

Compares packed float32 elements in *a* and *b*, and stores packed maximum values using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

> **NOTE**
> Pass `__MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

_mm512_maskz_max_round_ps

```
extern __m512 __cdecl _mm512_maskz_max_round_ps(__mmask16 k, __m512 a, __m512 b, int round);
```

Compares packed float32 elements in *a* and *b*, and stores packed maximum values using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

> **NOTE**
> Pass `__MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

_mm_mask_max_sd

```
extern __m128d __cdecl _mm_mask_max_sd(__m128d src, __mmask8 k, __m128d a, __m128d b);
```

Compares the lower float64 elements in *a* and *b*, stores the maximum value in the lower destination element using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copies the upper element from *a* to the upper destination element.

_mm_maskz_max_sd

```
extern __m128d __cdecl _mm_maskz_max_sd(__mmask8 k, __m128d a, __m128d b);
```

Compares the lower float64 elements in *a* and *b*, stores the maximum value in the lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies the upper element from *a* to the upper destination element.

_mm_max_round_sd

```
extern __m128d __cdecl _mm_max_round_sd(__m128d a, __m128d b, int round);
```

Compares the lower float64 elements in *a* and *b*, stores the maximum value in the lower destination element, and copies the upper element from *a* to the upper destination element.

> **NOTE**
> Pass `__MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

_mm_mask_max_round_sd

```
extern __m128d __cdecl _mm_mask_max_round_sd(__m128d src, __mmask8 k, __m128d a, __m128d b, int
round);
```

Compares the lower float64 elements in *a* and *b*, stores the maximum value in the lower destination element using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copies the upper element from *a* to the upper destination element.

> **NOTE**
> Pass `__MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

_mm_maskz_max_round_sd

```
extern __m128d __cdecl _mm_maskz_max_round_sd(__mmask8 k, __m128d a, __m128d b, int round);
```

Compares the lower float64 elements in *a* and *b*, stores the maximum value in the lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies the upper element from *a* to the upper destination element.

> **NOTE**
> Pass `__MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

_mm_mask_max_ss

```
extern __m128 __cdecl _mm_mask_max_ss(__m128 src, __mmask8 k, __m128 a, __m128 b);
```

Compares the lower float32 elements in *a* and *b*, stores the maximum value in the lower destination element using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copies the upper element from *a* to the upper destination element.

_mm_maskz_max_ss

```
extern __m128 __cdecl _mm_maskz_max_ss(__mmask8 k, __m128 a, __m128 b);
```

Compares the lower float32 elements in *a* and *b*, stores the maximum value in the lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies the upper element from *a* to the upper destination element.

_mm_max_round_ss

```
extern __m128 __cdecl _mm_max_round_ss(__m128 a, __m128 b, int round);
```

Compares the lower float32 elements in *a* and *b*, stores the maximum value in the lower destination element, and copies the upper element from *a* to the upper destination element.

> **NOTE**
> Pass `__MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

_mm_mask_max_round_ss

```
extern __m128 __cdecl _mm_mask_max_round_ss(__m128 src, __mmask8 k, __m128 a, __m128 b, int
round);
```

Compares the lower float32 elements in *a* and *b*, stores the maximum value in the lower destination element using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copies the upper element from *a* to the upper destination element.

> **NOTE**
> Pass `__MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

_mm_maskz_max_round_ss

```
extern __m128 __cdecl _mm_maskz_max_round_ss(__mmask8 k, __m128 a, __m128 b, int round);
```

Compares the lower float32 elements in *a* and *b*, stores the maximum value in the lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies the upper element from *a* to the upper destination element.

> **NOTE**
> Pass `__MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

_mm512_min_pd

```
extern __m512d __cdecl _mm512_min_pd(__m512d a, __m512d b);
```

Compares packed float64 elements in *a* and *b*, and stores packed minimum values.

_mm512_mask_min_pd

```
extern __m512d __cdecl _mm512_mask_min_pd(__m512d src, __mmask8 k, __m512d a,__m512d b);
```

Compares packed float64 elements in *a* and *b*, and stores packed minimum values using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_min_pd

```
extern __m512d __cdecl _mm512_maskz_min_pd(__mmask8 k, __m512d a, __m512d b);
```

Compares packed float64 elements in *a* and *b*, and store packed minimum values using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_min_round_pd

```
extern __m512d __cdecl _mm512_min_round_pd(__m512d a, __m512d b, int round);
```

Compares packed float64 elements in *a* and *b*, and stores packed minimum values.

> **NOTE**
> Pass `__MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

_mm512_mask_min_round_pd

```
extern __m512d __cdecl _mm512_mask_min_round_pd(__m512d src, __mmask8 k, __m512d a, __m512d b,
int round);
```

Compares packed float64 elements in *a* and *b*, and stores packed minimum values using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

> **NOTE**
> Pass `__MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

_mm512_maskz_min_round_pd

```
extern __m512d __cdecl _mm512_maskz_min_round_pd(__mmask8 k, __m512d a, __m512d b, int round);
```

Compares packed float64 elements in *a* and *b*, and stores packed minimum values using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

> **NOTE**
> Pass `__MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

_mm512_min_ps

```
extern __m512 __cdecl _mm512_min_ps(__m512 a, __m512 b);
```

Compares packed float32 elements in *a* and *b*, and stores packed minimum values.

_mm512_mask_min_ps

```
extern __m512 __cdecl _mm512_mask_min_ps(__m512 src, __mmask16 k, __m512 a, __m512 b);
```

Compares packed float32 elements in *a* and *b*, and stores packed minimum values using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_min_ps

```
extern __m512 __cdecl _mm512_maskz_min_ps(__mmask16 k, __m512 a, __m512 b;
```

Compares packed float32 elements in *a* and *b*, and store packed minimum values using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_min_round_ps

```
extern __m512 __cdecl _mm512_min_round_ps( __m512 a, __m512 b, int round);
```

Compares packed float32 elements in *a* and *b*, and stores packed minimum values.

> **NOTE**
> Pass `__MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

_mm512_mask_min_round_ps

```
extern __m512 __cdecl _mm512_mask_min_round_ps(__m512 src, __mmask16 k, __m512 a, __m512 b, int
round);
```

Compares packed float32 elements in *a* and *b*, and stores packed minimum values using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

> **NOTE**
> Pass `__MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

_mm512_maskz_min_round_ps

```
extern __m512 __cdecl _mm512_maskz_min_round_ps(__mmask16 k, __m512 a, __m512 b, int round);
```

Compares packed float32 elements in *a* and *b*, and stores packed minimum values using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

> **NOTE**
> Pass `__MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

_mm_mask_min_sd

```
extern __m128d __cdecl _mm_mask_min_sd(__m128d src, __mmask8 k, __m128d a, __m128d b);
```

Compares the lower float64 elements in *a* and *b*, stores the minimum value in the lower destination element using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copies the upper element from *a* to the upper destination element.

_mm_maskz_min_sd

```
extern __m128d __cdecl _mm_maskz_min_sd(__mmask8 k, __m128d a, __m128d b);
```

Compares the lower float64 elements in *a* and *b*, stores the minimum value in the lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies the upper element from *a* to the upper destination element.

_mm_min_round_sd

```
extern __m128d __cdecl _mm_min_round_sd(__m128d a, __m128d b, int round);
```

Compares the lower float64 elements in *a* and *b*, stores the minimum value in the lower destination element, and copies the upper element from *a* to the upper destination element.

NOTE
Pass `__MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

_mm_mask_min_round_sd

```
extern __m128d __cdecl _mm_mask_min_round_sd(__m128d src, __mmask8 k, __m128d a, __m128d b, int
round);
```

Compares the lower float64 elements in *a* and *b*, stores the minimum value in the lower destination element of using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copies the upper element from *a* to the upper destination element.

NOTE
Pass `__MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

_mm_maskz_min_round_sd

```
extern __m128d __cdecl _mm_maskz_min_round_sd(__mmask8 k, __m128d a, __m128d b, int round);
```

Compares the lower float64 elements in *a* and *b*, stores the minimum value in the lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies the upper element from *a* to the upper destination element.

NOTE
Pass `__MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

_mm_mask_min_ss

```
extern __m128 __cdecl _mm_mask_min_ss(__m128 src, __mmask8 k, __m128 a, __m128 b);
```

Compares the lower float32 elements in *a* and *b*, stores the minimum value in the lower destination element using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copies the upper element from *a* to the upper destination element.

_mm_maskz_min_ss

```
extern __m128 __cdecl _mm_maskz_min_ss(__mmask8 k, __m128 a, __m128 b);
```

Compares the lower float32 elements in *a* and *b*, stores the minimum value in the lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies the upper element from *a* to the upper destination element.

_mm_min_round_ss

```
extern __m128 __cdecl _mm_min_round_ss(__m128 a, __m128 b, int round);
```

Compares the lower float32 elements in *a* and *b*, stores the minimum value in the lower destination element, and copies the upper element from *a* to the upper destination element.

NOTE
Pass `_MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

_mm_mask_min_round_ss

```
extern __m128 __cdecl _mm_mask_min_round_ss(__m128 src, __mmask8 k, __m128 a, __m128 b, int
round);
```

Compares the lower float32 elements in *a* and *b*, stores the minimum value in the lower destination element using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copies the upper element from *a* to the upper destination element.

NOTE
Pass `_MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

_mm_maskz_min_round_ss

```
extern __m128 __cdecl _mm_maskz_min_round_ss(__mmask8 k, __m128 a, __m128 b, int round);
```

Compares the lower float32 elements in *a* and *b*, stores the minimum value in the lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies the upper element from *a* to the upper destination element.

NOTE
Pass `_MM_FROUND_NO_EXC` to *round* to suppress all exceptions.

Intrinsics for Determining Minimum and Maximum Integer Values

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `zmmintrin.h` header file.
To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

Intrinsic Name	Operation	Corresponding Intel® AVX-512 Instruction
`_mm512_max_epi32`, `_mm512_mask_max_epi32`, `_mm512_maskz_max_epi32`	Calculate maximum of packed int32 values.	`VPMAXSD`
`_mm512_min_epi32`, `_mm512_mask_min_epi32`, `_mm512_maskz_min_epi32`	Calculate minimum of packed int32 values.	`VPMINSD`
`_mm512_max_epu32`, `_mm512_mask_max_epu32`, `_mm512_maskz_max_epu32`	Calculate maximum of unpacked int32 values.	`VPMAXUD`
`_mm512_min_epu32`, `_mm512_mask_min_epu32`, `_mm512_maskz_min_epu32`	Calculate minimum of unpacked int32 values.	`VPMINUD`
`_mm512_max_epi64`, `_mm512_mask_max_epi64`, `_mm512_maskz_max_epi64`	Calculate maximum of packed signed int64 values.	`VPMAXSQ`
`_mm512_max_epu64`, `_mm512_mask_max_epu64`, `_mm512_maskz_max_epu64`	Calculate maximum of unpacked unsigned int64 values.	`VPMAXUQ`
`_mm512_min_epi64`, `_mm512_mask_min_epi64`, `_mm512_maskz_min_epi64`	Calculate minimum of packed signed int64 values.	`VPMINSQ`
`_mm512_min_epu64`, `_mm512_mask_min_epu64`, `_mm512_maskz_min_epu64`	Calculate minimum of unpacked unsigned int64 values.	`VPMINUQ`

variable	definition
k	writemask used as a selector
a	first source vector element
b	second source vector element
src	source element to use based on writemask result

_mm512_max_epi32

```
extern __m512i __cdecl _mm512_max_epi32(__m512i a, __m512i b);
```

Compares packed int32 elements in *a* and *b*, and stores packed maximum values.

_mm512_mask_max_epi32

```
extern __m512i __cdecl _mm512_mask_max_epi32(__m512i src, __mmask16 k, __m512i a, __m512i b);
```

Compares packed int32 elements in *a* and *b*, and stores packed maximum values using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_max_epi32

```
extern __m512i __cdecl _mm512_maskz_max_epi32(__mmask16 k, __m512i a, __m512i b);
```

Compares packed int32 elements in *a* and *b*, and stores packed maximum values using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_max_epi64

```
extern __m512i __cdecl _mm512_max_epi64(__m512i a, __m512i b);
```

Compares packed int64 elements in *a* and *b*, and stores packed maximum values.

_mm512_mask_max_epi64

```
extern __m512i __cdecl _mm512_mask_max_epi64(__m512i src, __mmask8 k, __m512i a, __m512i b);
```

Compares packed int64 elements in *a* and *b*, and stores packed maximum values using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_max_epi64

```
extern __m512i __cdecl _mm512_maskz_max_epi64(__mmask8 k, __m512i a, __m512i b);
```

Compares packed int64 elements in *a* and *b*, and stores packed maximum values using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_max_epu32

```
extern __m512i __cdecl _mm512_max_epu32(__m512i a,__m512i b);
```

Compares packed uint32 elements in *a* and *b*, and stores packed maximum values.

_mm512_mask_max_epu32

```
extern __m512i __cdecl _mm512_mask_max_epu32(__m512i src, __mmask16 k, __m512i a,__m512i b);
```

Compares packed uint32 elements in *a* and *b*, and stores packed maximum values using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_max_epu32

```
extern __m512i __cdecl _mm512_maskz_max_epu32(__mmask16 k, __m512i a, __m512i b);
```

Compares packed uint32 elements in *a* and *b*, and stores packed maximum values using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_max_epu64

```
extern __m512i __cdecl _mm512_max_epu64(__m512i a, __m512i b);
```

Compares packed uint64 elements in *a* and *b*, and stores packed maximum values.

_mm512_mask_max_epu64

```
extern __m512i __cdecl _mm512_mask_max_epu64(__m512i src, __mmask8 k, __m512i a, __m512i b);
```

Compares packed uint64 elements in *a* and *b*, and stores packed maximum values in using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_max_epu64

```
extern __m512i __cdecl _mm512_maskz_max_epu64(__mmask8 k, __m512i a, __m512i b);
```

Compares packed uint64 elements in *a* and *b*, and stores packed maximum values using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_min_epi32

```
extern __m512i __cdecl _mm512_min_epi32(__m512i a, __m512i b);
```

Compares packed int32 elements in *a* and *b*, and stores packed minimum values.

_mm512_mask_min_epi32

```
extern __m512i __cdecl _mm512_mask_min_epi32(__m512i src, __mmask16 k, __m512i a, __m512i b);
```

Compares packed int32 elements in *a* and *b*, and stores packed minimum values using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_min_epi32

```
extern __m512i __cdecl _mm512_maskz_min_epi32(__mmask16 k, __m512i a, __m512i b);
```

Compares packed int32 elements in *a* and *b*, and stores packed minimum values using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_min_epi64

```
extern __m512i __cdecl _mm512_min_epi64(__m512i a, __m512i b);
```

Compares packed int64 elements in *a* and *b*, and stores packed minimum values.

_mm512_mask_min_epi64

```
extern __m512i __cdecl _mm512_mask_min_epi64(__m512i src, __mmask8 k, __m512i a, __m512i b);
```

Compares packed int64 elements in *a* and *b*, and stores packed minimum values using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_min_epi64

```
extern __m512i __cdecl _mm512_maskz_min_epi64(__mmask8 k, __m512i a, __m512i b);
```

Compares packed int64 elements in *a* and *b*, and stores packed minimum values using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_min_epu32

```
extern __m512i __cdecl _mm512_min_epu32(__m512i a, __m512i b);
```

Compares packed uint32 elements in *a* and *b*, and stores packed minimum values.

_mm512_mask_min_epu32

```
extern __m512i __cdecl _mm512_mask_min_epu32(__m512i src, __mmask16 k, __m512i a, __m512i b);
```

Compares packed uint32 elements in *a* and *b*, and stores packed minimum values using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_min_epu32

```
extern __m512i __cdecl _mm512_maskz_min_epu32(__mmask16 k, __m512i a, __m512i b);
```

Compares packed uint32 elements in *a* and *b*, and stores packed minimum values using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_min_epu64

```
extern __m512i __cdecl _mm512_min_epu64(__m512i a, __m512i b);
```

Compares packed uint64 elements in *a* and *b*, and stores packed minimum values.

_mm512_mask_min_epu64

```
extern __m512i __cdecl _mm512_mask_min_epu64(__m512i src, __mmask8 k, __m512i a, __m512i b);
```

Compares packed uint64 elements in *a* and *b*, and stores packed minimum values using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_min_epu64

```
extern __m512i __cdecl _mm512_maskz_min_epu64(__mmask8 k, __m512i a, __m512i b);
```

Compares packed uint64 elements in *a* and *b*, and stores packed minimum values using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

Intrinsics for FP Fused Multiply-Add (FMA) Operations

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `zmmintrin.h` header file.
To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

Intrinsic Name	Operation	Corresponding Intel® AVX-512 Instruction
`_mm512_fmadd_pd`, `_mm512_mask3_fmadd_pd`, `_mm512_mask_fmadd_pd`, `_mm512_maskz_fmadd_pd`	Multiplies float64 element vector elements, then adds the intermediate result to float64 vector elements.	`VFMADD132PD`

Intrinsic Name	Operation	Corresponding Intel® AVX-512 Instruction
_mm512_fmadd_round_pd, _mm512_mask3_fmadd_round_pd, _mm512_mask_fmadd_round_pd, _mm512_maskz_fmadd_round_pd		
_mm512_fmadd_ps, _mm512_mask3_fmadd_ps, _mm512_mask_fmadd_ps, _mm512_maskz_fmadd_ps	Multiplies float32 element vector elements, then adds the intermediate result to float32 vector elements.	VFMADD132PS

variable	definition
k	writemask used as a selector
a	first source vector element
b	second source vector element
src	source element to use based on writemask result
round	Rounding control values; these can be one of the following (along with the `sae` suppress all exceptions flag): • `_MM_FROUND_TO_NEAREST_INT` - rounds to nearest even • `_MM_FROUND_TO_NEG_INF` - rounds to negative infinity • `_MM_FROUND_TO_POS_INF` - rounds to positive infinity • `_MM_FROUND_TO_ZERO` - rounds to zero • `_MM_FROUND_CUR_DIRECTION` - rounds using default from MXCSR register

_mm512_fmadd_pd

```
extern __m512d __cdecl _mm512_fmadd_pd(__m512d a, __m512d b, __m512d c);
```

Multiplies packed float64 elements in *a* and *b*, adds the intermediate result to packed elements in *c*, and stores the result.

_mm512_mask_fmadd_pd

```
extern __m512d __cdecl _mm512_mask_fmadd_pd(__m512d a, __mmask8 k, __m512d b, __m512d c);
```

Multiplies packed float64 elements in *a* and *b*, adds the intermediate result to packed elements in *c*, and stores the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm512_mask3_fmadd_pd

```
extern __m512d __cdecl _mm512_mask3_fmadd_pd(__m512d a, __m512d b, __m512d c, __mmask8 k);
```

Multiplies packed float64 elements in *a* and *b*, adds the intermediate result to packed elements in *c*, and stores the result using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm512_maskz_fmadd_pd

```
extern __m512d __cdecl _mm512_maskz_fmadd_pd(__mmask8 k, __m512d a, __m512d b, __m512d c);
```

Multiplies packed float64 elements in *a* and *b*, adds the intermediate result to packed elements in *c*, and stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_fmadd_round_pd

```
extern __m512d __cdecl _mm512_fmadd_round_pd(__m512d a, __m512d b, __m512d c, int round);
```

Multiplies packed float64 elements in *a* and *b*, adds the intermediate result to packed elements in *c*, and stores the result.

_mm512_mask_fmadd_round_pd

```
extern __m512d __cdecl _mm512_mask_fmadd_round_pd(__m512d a, __mmask8 k, __m512d b, __m512d c,
int round);
```

Multiplies packed float64 elements in *a* and *b*, adds the intermediate result to packed elements in *c*, and stores the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm512_mask3_fmadd_round_pd

```
extern __m512d __cdecl _mm512_mask3_fmadd_round_pd(__m512d a, __m512d b, __m512d c, __mmask8 k,
int round);
```

Multiplies packed float64 elements in *a* and *b*, adds the intermediate result to packed elements in *c*, and stores the result using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm512_maskz_fmadd_round_pd

```
extern __m512d __cdecl _mm512_maskz_fmadd_round_pd(__mmask8 k, __m512d a, __m512d b, __m512d c,
int round);
```

Multiplies packed float64 elements in *a* and *b*, adds the intermediate result to packed elements in *c*, and stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_fmadd_round_ps

```
extern __m512 __cdecl _mm512_fmadd_round_ps(__m512 a, __m512 b, __m512 c, int round);
```

Multiplies packed float32 elements in *a* and *b*, adds the intermediate result to packed elements in *c*, and stores the result.

_mm512_mask_fmadd_round_ps

```
extern __m512 __cdecl _mm512_mask_fmadd_round_ps(__m512 a, __mmask16 k, __m512 b, __m512 c, int
round);
```

Multiplies packed float32 elements in *a* and *b*, adds the intermediate result to packed elements in *c*, and stores the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm512_mask3_fmadd_round_ps

```
extern __m512 __cdecl _mm512_mask3_fmadd_round_ps(__m512 a, __m512 b, __m512 c, __mmask16 k, int
round);
```

Multiplies packed float32 elements in *a* and *b*, adds the intermediate result to packed elements in *c*, and stores the result using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm512_maskz_fmadd_round_ps

```
extern __m512 __cdecl _mm512_maskz_fmadd_round_ps(__mmask16 k, __m512 a, __m512 b, __m512 c,
const int round);
```

Multiplies packed float32 elements in *a* and *b*, adds the intermediate result to packed elements in *c*, and stores the result *a* using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_fmadd_ps

```
extern __m512 __cdecl _mm512_fmadd_ps(__m512 a, __m512 b, __m512 c);
```

Multiplies packed float32 elements in *a* and *b*, adds the intermediate result to packed elements in *c*, and stores the result.

_mm512_mask_fmadd_ps

```
extern __m512 __cdecl _mm512_mask_fmadd_ps(__m512 a, __mmask16 k, __m512 b, __m512 c);
```

Multiplies packed float32 elements in *a* and *b*, adds the intermediate result to packed elements in *c*, and stores the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm512_mask3_fmadd_ps

```
extern __m512 __cdecl _mm512_mask3_fmadd_ps(__m512, __m512 b, __m512 c, __mmask16 k);
```

Multiplies packed float32 elements in *a* and *b*, adds the intermediate result to packed elements in *c*, and stores the result using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm512_maskz_fmadd_ps

```
extern __m512 __cdecl _mm512_maskz_fmadd_ps(__mmask16 k, __m512 a, __m512 b, __m512 c);
```

Multiplies packed float32 elements in *a* and *b*, adds the intermediate result to packed elements in *c*, and stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_fmadd_round_ps

```
extern __m512 __cdecl _mm512_fmadd_round_ps(__m512 a, __m512 b, __m512 c, int round);
```

Multiplies packed float32 elements in *a* and *b*, adds the intermediate result to packed elements in *c*, and stores the result.

_mm512_mask_fmadd_round_ps

```
extern __m512 __cdecl _mm512_mask_fmadd_round_ps(__m512 a, __mmask16 k, __m512 b, __m512 c, int round);
```

Multiplies packed float32 elements in *a* and *b*, adds the intermediate result to packed elements in *c*, and stores the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm512_mask3_fmadd_round_ps

```
extern __m512 __cdecl _mm512_mask3_fmadd_round_ps(__m512 a, __m512 b, __m512 c, __mmask16 k, int round);
```

Multiplies packed float32 elements in *a* and *b*, adds the intermediate result to packed elements in *c*, and stores the result using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm512_maskz_fmadd_round_ps

```
extern __m512 __cdecl _mm512_maskz_fmadd_round_ps(__mmask16 k, __m512 a, __m512 b, __m512 c, int round);
```

Multiplies packed float32 elements in *a* and *b*, adds the intermediate result to packed elements in *c*, and stores the result *a* using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_fmadd_sd

```
extern __m128d __cdecl _mm_mask_fmadd_sd(__m128d a, __mmask8 k, __m128d b, __m128d c);
```

Multiplies lower float64 elements in *a* and *b*, and adds the intermediate result to lower element in *c*. Stores the result in lower destination element using writemask *k* (the element is copied from *a* when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_mask3_fmadd_sd

```
extern __m128d __cdecl _mm_mask3_fmadd_sd(__m128d a, __m128d b, __m128d c, __mmask8 k);
```

Multiplies lower float64 elements in *a* and *b*, and adds the intermediate result to lower element in *c*. Stores the result in lower destination element using writemask *k* (the element is copied from *c* when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_maskz_fmadd_sd

```
extern __m128d __cdecl _mm_maskz_fmadd_sd(__mmask8 k, __m128d a, __m128d b, __m128d c);
```

Multiplies lower float64 elements in *a* and *b*, and adds the intermediate result to lower element in *c*. Stores the result in lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_mask_fmadd_round_sd

```
extern __m128d __cdecl _mm_mask_fmadd_round_sd(__m128d a, __mmask8 k, __m128d b, __m128d c, int round);
```

Multiplies lower float64 elements in *a* and *b*, and adds the intermediate result to lower element in *c*. Stores the result in lower destination element using writemask *k* (the element is copied from *a* when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_mask3_fmadd_round_sd

```
extern __m128d __cdecl _mm_mask3_fmadd_round_sd(__m128d a, __m128d b, __m128d c, __mmask8 k, int
round);
```

Multiplies lower float64 elements in *a* and *b*, and adds the intermediate result to lower element in *c*. Stores the result in lower destination element using writemask *k* (the element is copied from *c* when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_maskz_fmadd_round_sd

```
extern __m128d __cdecl _mm_maskz_fmadd_round_sd(__mmask8 k, __m128d a, __m128d b, __m128d c, int
round);
```

Multiplies lower float64 elements in *a* and *b*, and adds the intermediate result to lower element in *c*. Stores the result in lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_mask_fmadd_ss

```
extern __m128 __cdecl _mm_mask_fmadd_ss(__m128 a, __mmask8 k, __m128 b, __m128 c);
```

Multiplies lower float32 elements in *a* and *b*, and adds the intermediate result to lower element in *c*. Stores the result in lower destination element using writemask *k* (the element is copied from *a* when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

_mm_mask3_fmadd_ss

```
extern __m128 __cdecl _mm_mask3_fmadd_ss(__m128 a, __m128 b, __m128 c, __mmask8 k);
```

Multiplies lower float32 elements in *a* and *b*, and adds the intermediate result to lower element in *c*. Stores the result in lower element using writemask *k* (the element is copied from *c* when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

_mm_maskz_fmadd_ss

```
extern __m128 __cdecl _mm_maskz_fmadd_ss(__mmask8 k, __m128 a, __m128 b, __m128 c);
```

Multiplies lower float32 elements in *a* and *b*, and adds the intermediate result to lower element in *c*. Stores the result in lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

_mm_mask_fmadd_round_ss

```
extern __m128 __cdecl _mm_mask_fmadd_round_ss(__m128 a, __mmask8 k, __m128 b, __m128 c, int
round);
```

Multiplies lower float32 elements in *a* and *b*, and adds the intermediate result to lower element in *c*. Stores the result in lower destination element using writemask *k* (the element is copied from *a* when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

_mm_mask3_fmadd_round_ss

```
extern __m128 __cdecl _mm_mask3_fmadd_round_ss(__m128 a, __m128 b, __m128 c, __mmask8 k, int
round);
```

Multiplies lower float32 elements in *a* and *b*, and adds the intermediate result to lower element in *c*. Stores the result in lower destination element using writemask *k* (the element is copied from *c* when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

_mm_maskz_fmadd_round_ss

```
extern __m128 __cdecl _mm_maskz_fmadd_round_ss(__mmask8 k, __m128 a, __m128 b, __m128 c, int
round);
```

Multiplies lower float32 elements in *a* and *b*, and adds the intermediate result to lower element in *c*. Stores the result in lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

_mm512_fmaddsub_pd

```
extern __m512d __cdecl _mm512_fmaddsub_pd(__m512d a, __m512d b, __m512d c);
```

Multiplies packed float64 elements in *a* and *b*, alternatively add and subtract packed elements in *c* to/from the intermediate result, and stores the result.

_mm512_mask_fmaddsub_pd

```
extern __m512d __cdecl _mm512_mask_fmaddsub_pd(__m512d, __mmask8 k, __m512d b, __m512d c);
```

Multiplies packed float64 elements in *a* and *b*, alternatively add and subtract packed elements in *c* to/from the intermediate result, and stores the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm512_mask3_fmaddsub_pd

```
extern __m512d __cdecl _mm512_mask3_fmaddsub_pd(__m512d a, __m512d k, __m512d b, __mmask8 c);
```

Multiplies packed float64 elements in *a* and *b*, alternatively add and subtract packed elements in *c* to/from the intermediate result, and stores the result using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm512_maskz_fmaddsub_pd

```
extern __m512d __cdecl _mm512_maskz_fmaddsub_pd(__mmask8 k, __m512d a, __m512d b, __m512d c);
```

Multiplies packed float64 elements in *a* and *b*, alternatively add and subtract packed elements in *c* to/from the intermediate result, and stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_fmaddsub_round_pd

```
extern __m512d __cdecl _mm512_fmsubadd_round_pd(__m512d a, __m512d b, __m512d c, int round);
```

Multiplies packed float64 elements in *a* and *b*, alternatively add and subtract packed elements in *c* to/from the intermediate result, and stores the result.

_mm512_mask_fmaddsub_round_pd

```
extern __m512d __cdecl _mm512_mask_fmsubadd_round_pd(__m512d a, __mmask8 k, __m512d b, __m512d
c, int round);
```

Multiplies packed float64 elements in *a* and *b*, alternatively add and subtract packed elements in *c* to/from the intermediate result, and stores the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm512_mask3_fmaddsub_round_pd

```
extern __m512d __cdecl _mm512_mask3_fmsubadd_round_pd(__m512d a, __m512d b, __m512d c, __mmask8
k, int round);
```

Multiplies packed float64 elements in *a* and *b*, alternatively add and subtract packed elements in *c* to/from the intermediate result, and stores the result using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm512_maskz_fmaddsub_round_pd

```
extern __m512d __cdecl _mm512_maskz_fmsubadd_round_pd(__mmask8 k, __m512d a, __m512d b, __m512d
c, int round);
```

Multiplies packed float64 elements in *a* and *b*, alternatively add and subtract packed elements in *c* to/from the intermediate result, and stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_fmaddsub_ps

```
extern __m512 __cdecl _mm512_fmaddsub_ps(__m512 a, __m512 b, __m512 c);
```

Multiplies packed float32 elements in *a* and *b*, alternatively add and subtract packed elements in *c* to/from the intermediate result, and stores the result.

_mm512_mask_fmaddsub_ps

```
extern __m512 __cdecl _mm512_mask_fmaddsub_ps(__m512 a, __mmask16 k, __m512 b, __m512 c);
```

Multiplies packed float32 elements in *a* and *b*, alternatively add and subtract packed elements in *c* to/from the intermediate result, and stores the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm512_mask3_fmaddsub_ps

```
extern __m512 __cdecl _mm512_mask3_fmaddsub_ps(__m512 a, __m512 b, __m512 c, __mmask16 k);
```

Multiplies packed float32 elements in *a* and *b*, alternatively add and subtract packed elements in *c* to/from the intermediate result, and stores the result using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm512_maskz_fmaddsub_ps

```
extern __m512 __cdecl _mm512_maskz_fmaddsub_ps(__mmask16 k, __m512 a, __m512 b, __m512 c);
```

Multiplies packed float32 elements in *a* and *b*, alternatively add and subtract packed elements in *c* to/from the intermediate result, and stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_fmaddsub_round_ps

```
extern __m512 __cdecl _mm512_fmaddsub_round_ps(__m512 a, __m512 b, __m512 c, int round);
```

Multiplies packed float32 elements in *a* and *b*, alternatively add and subtract packed elements in *c* to/from the intermediate result, and stores the result.

_mm512_mask_fmaddsub_round_ps

```
extern __m512 __cdecl _mm512_mask_fmaddsub_round_ps(__m512 a, __mmask16 k, __m512 b, __m512 c,
int round);
```

Multiplies packed float32 elements in *a* and *b*, alternatively add and subtract packed elements in *c* to/from the intermediate result, and stores the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm512_mask3_fmaddsub_round_ps

```
extern __m512 __cdecl _mm512_mask3_fmaddsub_round_ps(__m512 a, __m512 b, __m512 c, __mmask16 k,
int round);
```

Multiplies packed float32 elements in *a* and *b*, alternatively add and subtract packed elements in *c* to/from the intermediate result, and stores the result using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm512_maskz_fmaddsub_round_ps

```
extern __m512 __cdecl _mm512_maskz_fmaddsub_round_ps(__mmask16 k, __m512 a, __m512 b, __m512 c,
int round);
```

Multiplies packed float32 elements in *a* and *b*, alternatively add and subtract packed elements in *c* to/from the intermediate result, and stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_fmsub_pd

```
extern __m512d __cdecl _mm512_fmsub_pd(__m512d a, __m512d b, __m512d c);
```

Multiplies packed float64 elements in *a* and *b*, subtracts packed elements in *c* from the intermediate result, and stores the result.

_mm512_mask_fmsub_pd

```
extern __m512d __cdecl _mm512_mask_fmsub_pd(__m512d a, __mmask8 k, __m512d b, __m512d c);
```

Multiplies packed float64 elements in *a* and *b*, subtracts packed elements in *c* from the intermediate result, and stores the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm512_mask3_fmsub_pd

```
extern __m512d __cdecl _mm512_mask3_fmsub_pd(__m512d a, __m512d b, __m512d c, __mmask8 k);
```

Multiplies packed float64 elements in *a* and *b*, subtracts packed elements in *c* from the intermediate result, and stores the result using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm512_maskz_fmsub_pd

```
extern __m512d __cdecl _mm512_maskz_fmsub_pd(__mmask8 k, __m512d a, __m512d b, __m512d c);
```

Multiplies packed float64 elements in *a* and *b*, subtracts packed elements in *c* from the intermediate result, and stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_fmsub_round_pd

```
extern __m512d __cdecl _mm512_fmsub_round_pd(__m512d a, __m512d b, __m512d c, int round);
```

Multiplies packed float64 elements in *a* and *b*, subtracts packed elements in *c* from the intermediate result, and stores the result.

_mm512_mask_fmsub_round_pd

```
extern __m512d __cdecl _mm512_mask_fmsub_round_pd(__m512d a, __mmask8 k, __m512d b, __m512d c,
int round);
```

Multiplies packed float64 elements in *a* and *b*, subtracts packed elements in *c* from the intermediate result, and stores the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm512_mask3_fmsub_round_pd

```
extern __m512d __cdecl _mm512_mask3_fmsub_round_pd(__m512d a, __m512d b, __m512d c, __mmask8 k,
int round);
```

Multiplies packed float64 elements in *a* and *b*, subtracts packed elements in *c* from the intermediate result, and stores the result using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm512_maskz_fmsub_round_pd

```
extern __m512d __cdecl _mm512_maskz_fmsub_round_pd(__mmask8 k, __m512d a, __m512d b, __m512d c,
int round);
```

Multiplies packed float64 elements in *a* and *b*, subtracts packed elements in *c* from the intermediate result, and stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_fmsub_ps

```
extern __m512 __cdecl _mm512_fmsub_ps(__m512 a, __m512 b, __m512 c);
```

Multiplies packed float32 elements in *a* and *b*, subtracts packed elements in *c* from the intermediate result, and stores the result.

_mm512_mask_fmsub_ps

```
extern __m512 __cdecl _mm512_mask_fmsub_ps(__m512 a, __mmask16 k, __m512 b, __m512 c);
```

Multiplies packed float32 elements in *a* and *b*, subtracts packed elements in *c* from the intermediate result, and stores the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm512_mask3_fmsub_ps

```
extern __m512 __cdecl _mm512_mask3_fmsub_ps(__m512 a, __m512 b, __m512 c, __mmask16 k);
```

Multiplies packed float32 elements in *a* and *b*, subtracts packed elements in *c* from the intermediate result, and stores the result using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm512_maskz_fmsub_ps

```
extern __m512 __cdecl _mm512_maskz_fmsub_ps(__mmask16 k, __m512 a, __m512 b, __m512 c);
```

Multiplies packed float32 elements in *a* and *b*, subtracts packed elements in *c* from the intermediate result, and stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_fmsub_round_ps

```
extern __m512 __cdecl _mm512_fmsub_round_ps(__m512 a, __m512 b, __m512 c, int round);
```

Multiplies packed float32 elements in *a* and *b*, subtracts packed elements in *c* from the intermediate result, and stores the result.

_mm512_mask_fmsub_round_ps

```
extern __m512 __cdecl _mm512_mask_fmsub_round_ps(__m512 a, __mmask16 k, __m512 b, __m512 c, int
round);
```

Multiplies packed float32 elements in *a* and *b*, subtracts packed elements in *c* from the intermediate result, and stores the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm512_mask3_fmsub_round_ps

```
extern __m512 __cdecl _mm512_mask3_fmsub_round_ps(__m512 a, __m512 b, __m512 c, __mmask16 k, int
round);
```

Multiplies packed float32 elements in *a* and *b*, subtracts packed elements in *c* from the intermediate result, and stores the result using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm512_maskz_fmsub_round_ps

```
extern __m512 __cdecl _mm512_maskz_fmsub_round_ps(__mmask16 k, __m512 a, __m512 b, __m512 c, int
round);
```

Multiplies packed float32 elements in *a* and *b*, subtracts packed elements in *c* from the intermediate result, and stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_fmsub_sd

```
extern __m128d __cdecl _mm_mask_fmsub_sd(__m128d a, __mmask8 k, __m128d b, __m128d c);
```

Multiplies lower float64 elements in *a* and *b*, and subtracts lower element in *c* from the intermediate result. Stores the result in lower destination element using writemask *k* (the element is copied from *a* when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_mask3_fmsub_sd

```
extern __m128d __cdecl _mm_mask3_fmsub_sd(__m128d a, __m128d b, __m128d c, __mmask8 k);
```

Multiplies lower float64 elements in *a* and *b*, and subtracts lower element in *c* from the intermediate result. Stores the result in lower destination element using writemask *k* (the element is copied from *c* when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_maskz_fmsub_sd

```
extern __m128d __cdecl _mm_maskz_fmsub_sd(__mmask8 k, __m128d a, __m128d b, __m128d c);
```

Multiplies lower float64 elements in *a* and *b*, and subtracts lower element in *c* from the intermediate result. Stores the result in lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_mask_fmsub_round_sd

```
extern __m128d __cdecl _mm_mask_fmsub_round_sd(__m128d a, __mmask8 k, __m128d b, __m128d c, int
round);
```

Multiplies lower float64 elements in *a* and *b*, and subtracts lower element in *c* from the intermediate result. Stores the result in lower destination element using writemask *k* (the element is copied from *a* when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_mask3_fmsub_round_sd

```
extern __m128d __cdecl _mm_mask3_fmsub_round_sd(__m128d a, __m128d b, __m128d c, __mmask8 k, int
round);
```

Multiplies lower float64 elements in *a* and *b*, and subtracts lower element in *c* from the intermediate result. Stores the result in lower destination element using writemask *k* (the element is copied from *c* when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_maskz_fmsub_round_sd

```
extern __m128d __cdecl _mm_maskz_fmsub_round_sd(__mmask8 k, __m128d a, __m128d b, __m128d c, int
round);
```

Multiplies lower float64 elements in *a* and *b*, and subtracts lower element in *c* from the intermediate result. Stores the result in lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_mask_fmsub_ss

```
extern __m128 __cdecl _mm_mask_fmsub_ss(__m128 a, __mmask8 k, __m128 b, __m128 c);
```

Multiplies lower float32 elements in *a* and *b*, and subtracts lower element in *c* from the intermediate result. Stores the result in lower destination element using writemask *k* (the element is copied from *a* when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

_mm_mask3_fmsub_ss

```
extern __m128 __cdecl _mm_mask3_fmsub_ss(__m128 a, __m128 b, __m128 c, __mmask8 k);
```

Multiplies lower float32 elements in *a* and *b*, and subtracts lower element in *c* from the intermediate result. Stores the result in lower destination element using writemask *k* (the element is copied from *c* when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

_mm_maskz_fmsub_ss

```
extern __m128 __cdecl _mm_maskz_fmsub_ss(__mmask8 k, __m128 a, __m128 b, __m128 c);
```

Multiplies lower float32 elements in *a* and *b*, and subtracts lower element in *c* from the intermediate result. Stores the result in lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

_mm_mask_fmsub_round_ss

```
extern __m128 __cdecl _mm_mask_fmsub_round_ss(__m128 a, __mmask8 k, __m128 b, __m128 c, int
round);
```

Multiplies lower float32 elements in *a* and *b*, and subtracts lower element in *c* from the intermediate result. Stores the result in lower destination element using writemask *k* (the element is copied from *a* when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

_mm_mask3_fmsub_round_ss

```
extern __m128 __cdecl _mm_mask3_fmsub_round_ss(__m128 a, __m128 b, __m128 c, __mmask8 k, int
round);
```

Multiplies lower float32 elements in *a* and *b*, and subtracts lower element in *c* from the intermediate result. Stores the result in lower destination element using writemask *k* (the element is copied from *c* when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

_mm_maskz_fmsub_round_ss

```
extern __m128 __cdecl _mm_maskz_fmsub_round_ss(__mmask8 k, __m128 a, __m128 b, __m128 c, int
round);
```

Multiplies lower float32 elements in *a* and *b*, and subtracts lower element in *c* from the intermediate result. Stores the result in lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

_mm512_fmsubadd_pd

```
extern __m512d __cdecl _mm512_fmsubadd_pd(__m512d a, __m512d b, __m512d c);
```

Multiplies packed float64 elements in *a* and *b*, alternatively subtract and add packed elements in *c* from/to the intermediate result, and stores the result.

_mm512_mask_fmsubadd_pd

```
extern __m512d __cdecl _mm512_mask_fmsubadd_pd(__m512d a, __mmask8 k, __m512d b, __m512d c);
```

Multiplies packed float64 elements in *a* and *b*, alternatively subtract and add packed elements in *c* from/to the intermediate result, and stores the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm512_mask3_fmsubadd_pd

```
extern __m512d __cdecl _mm512_mask3_fmsubadd_pd(__m512d a, __m512d b, __m512d c, __mmask8 k);
```

Multiplies packed float64 elements in *a* and *b*, alternatively subtract and add packed elements in *c* from/to the intermediate result, and stores the result using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm512_maskz_fmsubadd_pd

```
extern __m512d __cdecl _mm512_maskz_fmsubadd_pd(__mmask8 k, __m512d a, __m512d b, __m512d c);
```

Multiplies packed float64 elements in *a* and *b*, alternatively subtract and add packed elements in *c* from/to the intermediate result, and stores the result destination using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_fmsubadd_round_pd

```
extern __m512d __cdecl _mm512_fmaddsub_round_pd(__m512d a, __m512d b, __m512d c, int round);

int round);
```

Multiplies packed float32 elements in *a* and *b*, adds the negated intermediate result to packed elements in *c*, and stores the result using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm512_maskz_fnmadd_round_ps

```
extern __m512 __cdecl _mm512_maskz_fnmadd_round_ps(__mmask16 k, __m512 a, __m512 b, __m512 c,
int round);
```

Multiplies packed float32 elements in *a* and *b*, adds the negated intermediate result to packed elements in *c*, and stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_fnmadd_sd

```
extern __m128d __cdecl _mm_mask_fnmadd_sd(__m128d a, __mmask8 k, __m128d b, __m128d c);
```

Multiplies lower float64 elements in *a* and *b*, and adds the negated intermediate result to lower element in *c*. Stores the result in lower destination element using writemask *k* (the element is copied from *a* when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_mask3_fnmadd_sd

```
extern __m128d __cdecl _mm_mask3_fnmadd_sd(__m128d a, __m128d b, __m128d c, __mmask8 k);
```

Multiplies lower float64 elements in *a* and *b*, and adds the negated intermediate result to lower element in *c*. Stores the result in lower destination element using writemask *k* (the element is copied from *c* when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_maskz_fnmadd_sd

```
extern __m128d __cdecl _mm_maskz_fnmadd_sd(__mmask8 k, __m128d a, __m128d b, __m128d c);
```

Multiplies lower float64 elements in *a* and *b*, and adds the negated intermediate result to lower element in *c*. Stores the result in lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_mask_fnmadd_round_sd

```
extern __m128d __cdecl _mm_mask_fnmadd_round_sd(__m128d a, __mmask8 k, __m128d b, __m128d c, int round);
```

Multiplies lower float64 elements in *a* and *b*, and adds the negated intermediate result to lower element in *c*. Stores the result in lower destination element using writemask *k* (the element is copied from *a* when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_mask3_fnmadd_round_sd

```
extern __m128d __cdecl _mm_mask3_fnmadd_round_sd(__m128d a, __m128d b, __m128d c, __mmask8 k, int round);
```

Multiplies lower float64 elements in *a* and *b*, and adds the negated intermediate result to lower element in *c*. Stores the result in lower destination element using writemask *k* (the element is copied from *c* when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_maskz_fnmadd_round_sd

```
extern __m128d __cdecl _mm_maskz_fnmadd_round_sd(__mmask8 k, __m128d a, __m128d b, __m128d c, int round);
```

Multiplies lower float64 elements in *a* and *b*, and adds the negated intermediate result to lower element in *c*. Stores the result in lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_mask_fnmadd_ss

```
extern __m128 __cdecl _mm_mask_fnmadd_ss(__m128 a, __mmask8 k, __m128 b, __m128 c);
```

Multiplies lower float32 elements in *a* and *b*, and adds the negated intermediate result to lower element in *c*. Stores the result in lower destination element using writemask *k* (the element is copied from *a* when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

_mm_mask3_fnmadd_ss

```
extern __m128 __cdecl _mm_mask3_fnmadd_ss(__m128 a, __m128 b, __m128 c, __mmask8 k);
```

Multiplies lower float32 elements in *a* and *b*, and adds the negated intermediate result to lower element in *c*. Stores the result in lower destination element using writemask *k* (the element is copied from *c* when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

_mm_maskz_fnmadd_ss

```
extern __m128 __cdecl _mm_maskz_fnmadd_ss(__mmask8 k, __m128 a, __m128 b, __m128 c);
```

Multiplies lower float32 elements in *a* and *b*, and adds the negated intermediate result to lower element in *c*. Stores the result in lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

_mm_mask_fnmadd_round_ss

```
extern __m128 __cdecl _mm_mask_fnmadd_round_ss(__m128 a, __mmask8 k, __m128 b, __m128 c, int round);
```

Multiplies lower float32 elements in *a* and *b*, and adds the negated intermediate result to lower element in *c*. Stores the result in lower destination element using writemask *k* (the element is copied from *a* when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

_mm_mask3_fnmadd_round_ss

```
extern __m128 __cdecl _mm_mask3_fnmadd_round_ss(__m128 a, __m128 b, __m128 c, __mmask8 k, int round);
```

Multiplies lower float32 elements in *a* and *b*, and adds the negated intermediate result to lower element in *c*. Stores the result in lower destination element using writemask *k* (the element is copied from *c* when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

_mm_maskz_fnmadd_round_ss

```
extern __m128 __cdecl _mm_maskz_fnmadd_round_ss(__mmask8 k, __m128 a, __m128 b, __m128 c, int round);
```

Multiplies lower float32 elements in *a* and *b*, and adds the negated intermediate result to lower element in *c*. Stores the result in lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

_mm512_fnmsub_pd

```
extern __m512d __cdecl _mm512_fnmsub_pd(__m512d a, __m512d b, __m512d c);
```

Multiplies packed float64 elements in *a* and *b*, subtracts packed elements in *c* from the negated intermediate result, and stores the result.

_mm512_mask_fnmsub_pd

```
extern __m512d __cdecl _mm512_mask_fnmsub_pd(__m512d a, __mmask8 k, __m512d b, __m512d c);
```

Multiplies packed float64 elements in *a* and *b*, subtracts packed elements in *c* from the negated intermediate result, and stores the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm512_mask3_fnmsub_pd

```
extern __m512d __cdecl _mm512_mask3_fnmsub_pd(__m512d a, __m512d b, __m512d c, __mmask8 k);
```

Multiplies packed float64 elements in *a* and *b*, subtracts packed elements in *c* from the negated intermediate result, and stores the result using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm512_maskz_fnmsub_pd

```
extern __m512d __cdecl _mm512_maskz_fnmsub_pd(__mmask8 k, __m512d a, __m512d b, __m512d c);
```

Multiplies packed float64 elements in *a* and *b*, subtracts packed elements in *c* from the negated intermediate result, and stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_fnmsub_round_pd

```
extern __m512d __cdecl _mm512_fnmsub_round_pd(__m512d a, __m512d b, __m512d c, int round);
```

Multiplies packed float64 elements in *a* and *b*, subtracts packed elements in *c* from the negated intermediate result, and stores the result.

_mm512_mask_fnmsub_round_pd

```
extern __m512d __cdecl _mm512_mask_fnmsub_round_pd(__m512d a, __mmask8 k, __m512d b, __m512d c,
int round);
```

Multiplies packed float64 elements in *a* and *b*, subtracts packed elements in *c* from the negated intermediate result, and stores the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm512_mask3_fnmsub_round_pd

```
extern __m512d __cdecl _mm512_mask3_fnmsub_round_pd(__m512d a, __m512d b, __m512d c, __mmask8 k,
int round);
```

Multiplies packed float64 elements in *a* and *b*, subtracts packed elements in *c* from the negated intermediate result, and stores the result using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm512_maskz_fnmsub_round_pd

```
extern __m512d __cdecl _mm512_maskz_fnmsub_round_pd(__mmask8 k, __m512d a, __m512d b, __m512d c,
int round);
```

Multiplies packed float64 elements in *a* and *b*, subtracts packed elements in *c* from the negated intermediate result, and stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_fnmsub_ps

```
extern __m512 __cdecl _mm512_fnmsub_ps(__m512 a, __m512 b, __m512 c);
```

Multiplies packed float32 elements in *a* and *b*, subtracts packed elements in *c* from the negated intermediate result, and stores the result.

_mm512_mask_fnmsub_ps

```
extern __m512 __cdecl _mm512_mask_fnmsub_ps(__m512 a, __mmask16 k, __m512 b, __m512 c);
```

Multiplies packed float32 elements in *a* and *b*, subtracts packed elements in *c* from the negated intermediate result, and stores the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm512_mask3_fnmsub_ps

```
extern __m512 __cdecl _mm512_mask3_fnmsub_ps(__m512 a, __m512 b, __m512 c, __mmask16 k);
```

Multiplies packed float32 elements in *a* and *b*, subtracts packed elements in *c* from the negated intermediate result, and stores the result using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm512_maskz_fnmsub_ps

```
extern __m512 __cdecl _mm512_maskz_fnmsub_ps(__mmask16 k, __m512 a, __m512 b, __m512 c);
```

Multiplies packed float32 elements in *a* and *b*, subtracts packed elements in *c* from the negated intermediate result, and stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_fnmsub_round_ps

```
extern __m512 __cdecl _mm512_fnmsub_round_ps(__m512 a, __m512 b, __m512 c, int round);
```

Multiplies packed float32 elements in *a* and *b*, subtracts packed elements in *c* from the negated intermediate result, and stores the result.

_mm512_mask_fnmsub_round_ps

```
extern __m512 __cdecl _mm512_mask_fnmsub_round_ps(__m512 c, __mmask16 k, __m512 a, __m512 b, int
round);
```

Multiplies packed float32 elements in *a* and *b*, subtracts packed elements in *c* from the negated intermediate result, and stores the result using writemask *k* (elements are copied from *a* when the corresponding mask bit is not set).

_mm512_mask3_fnmsub_round_ps

```
extern __m512 __cdecl _mm512_mask3_fnmsub_round_ps(__m512 a, __m512 b, __m512 c, __mmask16 k,
int round);
```

Multiplies packed float32 elements in *a* and *b*, subtracts packed elements in *c* from the negated intermediate result, and stores the result using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm512_maskz_fnmsub_round_ps

```
extern __m512 __cdecl _mm512_maskz_fnmsub_round_ps(__mmask16 k, __m512 a, __m512 b, __m512 c,
int round);
```

Multiplies packed float32 elements in *a* and *b*, subtracts packed elements in *c* from the negated intermediate result, and stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mask_fnmsub_sd

```
extern __m128d __cdecl _mm_mask_fnmsub_sd(__m128d c, __mmask8 k, __m128d a, __m128d b);
```

Multiplies lower float64 elements in *a* and *b*, and subtracts lower element in *c* from the negated intermediate result. Stores the result in lower destination element using writemask *k* (the element is copied from *c* when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_mask3_fnmsub_sd

```
extern __m128d __cdecl _mm_mask3_fnmsub_sd(__m128d a, __m128d b, __m128d c, __mmask8 k);
```

Multiplies lower float64 elements in *a* and *b*, and subtracts lower element in *c* from the negated intermediate result. Stores the result in lower destination element using writemask *k* (the element is copied from *c* when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_maskz_fnmsub_sd

```
extern __m128d __cdecl _mm_maskz_fnmsub_sd(__mmask8 k, __m128d a, __m128d b, __m128d c);
```

Multiplies lower float64 elements in *a* and *b*, and subtracts lower element in *c* from the negated intermediate result. Stores the result lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_mask_fnmsub_ss

```
extern __m128 __cdecl _mm_mask_fnmsub_ss(__m128 c, __mmask8 k, __m128 a, __m128 b);
```

Multiplies lower float32 elements in *a* and *b*, and subtracts lower element in *c* from the negated intermediate result. Stores the result in lower destination element using writemask *k* (the element is copied from *c* when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

_mm_mask3_fnmsub_ss

```
extern __m128 __cdecl _mm_mask3_fnmsub_ss(__m128 a, __m128 b, __m128 c, __mmask8 k);
```

Multiplies lower float32 elements in *a* and *b*, and subtracts lower element in *c* from the negated intermediate result. Stores the result in lower destination element, and copies upper element from *a* to upper destination element using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm_maskz_fnmsub_ss

```
extern __m128 __cdecl _mm_maskz_fnmsub_ss(__mmask8 k, __m128 a, __m128 b, __m128 c);
```

Multiplies lower float32 elements in *a* and *b*, and subtracts lower element in *c* from the negated intermediate result. Stores the result in lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

_mm_mask_fnmsub_round_ss

```
extern __m128 __cdecl _mm_mask_fnmsub_round_ss(__m128 c, __mmask8 k, __m128 a, __m128 b, int
round);
```

Multiplies lower float32 elements in *a* and *b*, and subtracts lower element in *c* from the negated intermediate result. Stores the result in lower destination element using writemask *k* (the element is copied from *c* when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

_mm_mask3_fnmsub_round_ss

```
extern __m128 __cdecl _mm_mask3_fnmsub_round_ss(__m128 a, __m128 b, __m128 c, __mmask8 k, int
round);
```

Multiplies lower float32 elements in *a* and *b*, subtract lower element in *c* from the negated intermediate result, Stores the result in lower destination element, and copies upper element from *a* to upper destination element using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm_maskz_fnmsub_round_ss

```
extern __m128 __cdecl _mm_maskz_fnmsub_round_ss(__mmask8 k, __m128 a, __m128 b, __m128 c, int
round);
```

Multiplies lower float32 elements in *a* and *b*, and subtracts lower element in *c* from the negated intermediate result. Stores the result in lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

_mm_mask_fnmsub_round_sd

```
extern __m128d __cdecl _mm_mask_fnmsub_round_sd(__m128d c, __mmask8 k, __m128d a, __m128d b, int
round);
```

Multiplies lower float64 elements in *a* and *b*, and subtracts lower element in *c* from the negated intermediate result. Stores the result in lower destination element using writemask *k* (the element is copied from *c* when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_mask3_fnmsub_round_sd

```
extern __m128d __cdecl _mm_mask3_fnmsub_round_sd(__m128d a, __m128d b, __m128d c, __mmask8 k, 
int round);
```

Multiplies lower float64 elements in *a* and *b*, and subtracts lower element in *c* from the negated intermediate result. Stores the result in lower destination element using writemask *k* (the element is copied from *c* when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_maskz_fnmsub_round_sd

```
extern __m128d __cdecl _mm_maskz_fnmsub_round_sd(__mmask8 k, __m128d a, __m128d b, __m128d c, 
int round);
```

Multiplies lower float64 elements in *a* and *b*, and subtracts lower element in *c* from the negated intermediate result. Stores the result lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies upper element from *a* to upper destination element.

_mm_mask_fnmsub_ss

```
extern __m128 __cdecl _mm_mask_fnmsub_ss(__m128 a, __mmask8 k, __m128 b, __m128 c);
```

Multiplies lower float32 elements in *a* and *b*, and subtracts lower element in *c* from the negated intermediate result. Stores the result in lower destination element using writemask *k* (the element is copied from *c* when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

_mm_mask3_fnmsub_ss

```
extern __m128 __cdecl _mm_mask3_fnmsub_ss(__m128 a, __m128 b, __m128 c, __mmask8 k);
```

Multiplies lower float32 elements in *a* and *b*, and subtracts lower element in *c* from the negated intermediate result. Stores the result in lower destination element, and copies upper element from *a* to upper destination element using writemask *k* (elements are copied from *c* when the corresponding mask bit is not set).

_mm_maskz_fnmsub_ss

```
extern __m128 __cdecl _mm_maskz_fnmsub_ss(__mmask8 k, __m128 a, __m128 b, __m128 c);
```

Multiplies lower float32 elements in *a* and *b*, and subtracts lower element in *c* from the negated intermediate result. Stores the result in lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copies upper three packed elements from *a* to upper destination elements.

Intrinsics for Multiplication Operations

Intrinsics for FP Multiplication Operations

The prototypes for Intel® Advanced Vector Extensions 512 (Intel® AVX-512) intrinsics are located in the `zmmintrin.h` header file.
To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

Intrinsic Name	Operation	Corresponding Intel® AVX-512 Instruction

`_mm_mul_round_sd`, `_mm_mask_mul_round_sd`, `_mm_maskz_mul_round_sd`
 	
`_mm_mask_mul_sd`, `_mm_maskz_mul_sd`
	Multiplies rounded vectors.	`VMULSD`

`_mm_mul_round_ss`, `_mm_mask_mul_round_ss`, `_mm_maskz_mul_round_ss`
 	
`_mm_mask_mul_ss`, `_mm_maskz_mul_ss`
	Multiplies rounded vectors.	`VMULSS`

`_mm512_mul_round_pd`, `_mm512_mask_mul_round_pd`, `_mm512_maskz_mul_round_pd`
 	
`_mm512_mul_pd`, `_mm512_mask_mul_pd`, `_mm512_maskz_mul_pd`
	Multiplies rounded float64 vectors.	`VMULPD`

`_mm512_mul_round_ps`, `_mm512_mask_mul_round_ps`, `_mm512_maskz_mul_round_ps`
 	
`_mm512_mul_ps`, `_mm512_mask_mul_ps`, `_mm512_maskz_mul_ps`
	Multiplies rounded float32 vectors.	`VMULPS`

variable	definition
k	writemask used as a selector
a	first source vector element
b	second source vector element
src	source element to use based on writemask result
round	Rounding control values; these can be one of the following (along with the `sae` suppress all exceptions flag): • `_MM_FROUND_TO_NEAREST_INT` - rounds to nearest even • `_MM_FROUND_TO_NEG_INF` - rounds to negative infinity • `_MM_FROUND_TO_POS_INF` - rounds to positive infinity • `_MM_FROUND_TO_ZERO` - rounds to zero • `_MM_FROUND_CUR_DIRECTION` - rounds using default from MXCSR register

_mm512_mul_pd

```
extern __m512d __cdecl _mm512_mul_pd(__m512d a, __m512d b);
```

Multiplies packed float64 elements in *a* and *b*, stores the result.

_mm512_mask_mul_pd

```
extern __m512d __cdecl _mm512_mask_mul_pd(__m512d src, __mmask8 k, __m512d a, __m512d b);
```

Multiplies packed float64 elements in *a* and *b*, stores the result using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_mul_pd

```
extern __m512d __cdecl _mm512_maskz_mul_pd(__mmask8 k, __m512d a, __m512d b);
```

Multiplies packed float64 elements in *a* and *b*, stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mul_round_pd

```
extern __m512d __cdecl _mm512_mul_round_pd(__m512d a, __m512d b, int round);
```

Multiplies packed float64 elements in *a* and *b*, stores the result.

_mm512_mask_mul_round_pd

```
extern __m512d __cdecl _mm512_mask_mul_round_pd(__m512d src, __mmask8 k, __m512d a, __m512d b,
int round);
```

Multiplies packed float64 elements in *a* and *b*, stores the result using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_mul_round_pd

```
extern __m512d __cdecl _mm512_maskz_mul_round_pd(__mmask8 k, __m512d a, __m512d b, int round);
```

Multiplies packed float64 elements in *a* and *b*, stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mul_ps

```
extern __m512 __cdecl _mm512_mul_ps(__m512 a, __m512 b);
```

Multiplies packed float32 elements in *a* and *b*, stores the result.

_mm512_mask_mul_ps

```
extern __m512 __cdecl _mm512_mask_mul_ps(__m512 src, __mmask16 k, __m512 a, __m512 b);
```

Multiplies packed float32 elements in *a* and *b*, stores the result using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_mul_ps

```
extern __m512 __cdecl _mm512_maskz_mul_ps(__mmask16 k, __m512 a, __m512 b);
```

Multiplies packed float32 elements in *a* and *b*, stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm512_mul_round_ps

```
extern __m512 __cdecl _mm512_mul_round_ps(__m512 a, __m512 b, int round);
```

Multiplies packed float32 elements in *a* and *b*, stores the result.

_mm512_mask_mul_round_ps

```
extern __m512 __cdecl _mm512_mask_mul_round_ps(__m512 src, __mmask16 k, __m512 a, __m512 b, int round);
```

Multiplies packed float32 elements in *a* and *b*, stores the result using writemask *k* (elements are copied from *src* when the corresponding mask bit is not set).

_mm512_maskz_mul_round_ps

```
extern __m512 __cdecl _mm512_maskz_mul_round_ps(__mmask16 k, __m512 a, __m512 b, int round);
```

Multiplies packed float32 elements in *a* and *b*, stores the result using zeromask *k* (elements are zeroed out when the corresponding mask bit is not set).

_mm_mul_round_sd

```
extern __m128d __cdecl _mm_mul_round_sd(__m128d a, __m128d b, int round);
```

Multiplies the lower float64 element in *a* and *b*, stores the result in the lower destination element, and copy the upper element from *a* to the upper destination element.

_mm_mask_mul_round_sd

```
extern __m128d __cdecl _mm_mask_mul_round_sd(__m128d src, __mmask8 k, __m128d a, __m128d b, int round);
```

Multiplies the lower float64 element in *a* and *b*, stores the result in the lower destination element using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copy the upper element from *a* to the upper destination element.

_mm_maskz_mul_round_sd

```
extern __m128d __cdecl _mm_maskz_mul_round_sd(__mmask8 k, __m128d a, __m128d b, int round);
```

Multiplies the lower float64 element in *a* and *b*, stores the result in the lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copy the upper element from *a* to the upper destination element.

_mm_mask_mul_sd

```
extern __m128d __cdecl  _mm_mask_mul_sd(__m128d src, __mmask8 k, __m128d a, __m128d b);
```

Multiplies the lower float64 element in *a* and *b*, stores the result in the lower destination element using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copy the upper element from *a* to the upper destination element.

_mm_maskz_mul_sd

```
extern __m128d __cdecl _mm_maskz_mul_sd(__mmask8 k, __m128d a, __m128d b);
```

Multiplies the lower float64 element in *a* and *b*, stores the result in the lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copy the upper element from *a* to the upper destination element.

_mm_mul_round_ss

```
extern __m128 __cdecl _mm_mul_round_ss(__m128 a, __m128 b, int round);
```

Multiplies the lower float32 element in *a* and *b*, stores the result in the lower destination element, and copy the upper three packed elements from *a* to the upper destination elements.

_mm_mask_mul_round_ss

```
extern __m128 __cdecl _mm_mask_mul_round_ss(__m128 src, __mmask8 k, __m128 a, __m128 b, int
round);
```

Multiplies the lower float32 element in *a* and *b*, stores the result in the lower destination element using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copy the upper three packed elements from *a* to the upper destination elements.

_mm_maskz_mul_round_ss

```
extern __m128 __cdecl _mm_maskz_mul_round_ss(__mmask8 k, __m128 a, __m128 b, int round);
```

Multiplies the lower float32 element in *a* and *b*, stores the result in the lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copy the upper three packed elements from *a* to the upper destination elements.

_mm_mask_mul_ss

```
extern __m128 __cdecl _mm_mask_mul_ss(__m128 src, __mmask8 k, __m128 a, __m128 b);
```

Multiplies the lower float32 element in *a* and *b*, stores the result in the lower destination element using writemask *k* (the element is copied from *src* when mask bit 0 is not set), and copy the upper three packed elements from *a* to the upper destination elements.

_mm_maskz_mul_ss

```
extern __m128 __cdecl _mm_maskz_mul_ss(__mmask8 k, __m128 a, __m128 b);
```

Multiplies the lower float32 element in *a* and *b*, stores the result in the lower destination element using zeromask *k* (the element is zeroed out when mask bit 0 is not set), and copy the upper three packed elements from *a* to the upper destination elements.

Intrinsics for Integer Multiplication Operations

The prototypes for Intel© Advanced Vector Extensions 512 (Intel© AVX-512) intrinsics are located in the `zmmintrin.h` header file.
To use these intrinsics, include the `immintrin.h` file as follows:

```
#include <immintrin.h>
```

Intrinsic Name	Operation	Corresponding Intel® AVX-512 Instruction
`_mm512_mul_epi32`, `_mm512_mask_mul_epi32`, `_mm512_maskz_mul_epi32`	Multiplies alternating int32 vectors together to produce int64.	`VPMULDQ`

Intrinsic Name	Operation	Corresponding Intel® AVX-512 Instruction
`_mm512_mul_epu32`, `_mm512_mask_mul_epu32`, `_mm512_maskz_mul_epu32`	Multiplies alternating unsigned int32 vectors together to produce int64.	`VPMULUDQ`
`_mm512_mullo_epi32`, `_mm512_mask_mullo_epi32`	Multiplies int32 vectors together to produce int64.	`VPMULLD`
`_mm512_mullox_epi64`, `_mm512_mask_mullox_epi64`	Multiplies int64 vectors together to produce int64.	**None.**

variable	definition
k	writemask used as a selector
a	first source vector element
b	second source vector element
src	source element to use based on writemask result

_mm512_mul_epi32

```
extern __m512i __cdecl _mm512_mul_epi32(__m512i a, __m512i b);
```
